AND

LIVE STOCK JOURNAL.

Vol. 6. San Jose, Cal., December, 1875. No. 12

DAMPNESS INSIDE OF DWELLINGS AND HOW TO OBVIATE IT.

A lady subscriber writes that the recent wet spell of weather, although good for farming out-of-doors, has been rough on housewives who have large washings to do, and that the damp has accumulated in sleeping-rooms so that the walls are mouldy and even the bedding is damp. She wishes to know how to remedy this, or rather, how to prevent it.

In reply we will say that much of the dampness complained of has probably come from the tea-kettle and other vessels that are allowed to steam upon the stove in the kitchen. The steam does not condense upon the walls of the kitchen, because the ceiling is warmed in that room; but it escapes from the kitchen through doors into other rooms that are cold, and whatever the particles of steam and moisture from off the stove comes in contact with in cold rooms it condenses upon them, so that the walls, furniture, bedding, etc., all accumulate moisture by condensation in this way. Another thing we will call attention to in this connection — whatever is boiling upon the stove, be it ham, cabbage, onions, corned beef or other food, if the doors leading from the kitchen to other parts of the house are open, the scents are carried with the steam and deposited upon whatever is cold enough to condense the steam. This is why some houses are filled with a smell "peculiar to the family," as all the clothes catch a share of it and carry it, too.

Our advice in this case is, first, whenever any vessel is steaming on the stove, shut the doors that connect with other rooms and open window or outside door of the kitchen to allow the steam to escape. Don't allow steaming upon the stove excepting when necessary to do cooking, washing, etc. When there is nothing steaming upon the stove and a clear, dry heat alone is generated, then open the other door and allow the dry heat to circulate through the rooms. At other times it is well, in fact necessary, to open windows and air the rooms thoroughly. The best time to do this in Winter is usually after ten o'clock in the morning, when the air is the dryest and a breeze has sprung up which is drying. With a little studious care no room or article in the house need to get moist or musty. It is only necessary to understand the philosophy of the thing, ventilate thoroughly at suitabl times, use the dry heat from stoves and fireplaces whenever it is convenient, and be careful to observe and enforce such rules as are in accordance with reason.

Quicklime and wood ashes, made into a whitewash, will destroy the moss on old hide-bound tree. Try it. Lo not use it with much potash on smooth-barked or young trees, as there is danger of injuring them.

FINANCIAL.

Dr. Scott's article on the "Danger of Borrowing," in this issue, is worth reading and pondering upon. It is certainly better for us all to get down as near first principles as we can, and "go slow," as the saying is. In other words, depend upon self more, and make industry and close application to business within our means the method of acquiring means with which to branch out, and grow like the oak—slowly but surely.

As the year draws to a close, it is a fit time to take a retrospective glance at the prospects and realizations of the past, and pondering upon the lesson, determine the best course to pursue in the future. If our mistakes have led us into difficulties, let us not be cast down, but arise superior to them and do better next time, or try to, at any rate. Those who have lost by borrowing should in a great measure blame themselves, although the present financial system is certainly oppressive upon industry and ought to be revolutionized. Bankers, like men in other speculative trades, naturally try to take advantage of the market, and even will control it, if they can, to their own advantage. To be sure they are to blame for tightening up their purse-strings, advancing interest rates and foreclosing upon a man who has a show to save himself; but until a better financial system prevails, what else can we expect of coin-hardened, case-hardened men? A better financial system! How is that to come about? Who is to give it to us, and what will it be? These are questions that interest us all, and upon which there is self-interest of the money-power upon one side, and the poor, divided-in-opinion common people on the other side. Who, indeed, will give us a better system, and how? Not the bankers, you may depend; not those whose interests are with the banks. Like every great reform that ever gained sway, the *people must be the ones to move and to give it to themselves*, in spite of all opposition. This means revolution—peaceable if we can, forcible if we must. An honest system must spring from an honest people. An intelligent system must be the progeny of an intelligent people.

The honesty and the intelligence are both sadly lacking; still there is hope that our people will soon be prepared for a grand reform in this direction.

The Trapper.

We have received a copy of the Amateur Trapper and Trap-Makers' Guide, which is a complete and carefully prepared treatise on the art of trapping, snaring and netting, containing a great deal of useful information. Written by Stanley Harding and published by Dick & Fitzgerald, 18 Ann street, New York. Just the book for the boys. Price only 50 cents. Send for one.

The Next Number comences a new volumn with improvements. Subscribe now.

Many subscribers to this journal have expressed satisfaction at and approval of our admitting none but worthy business advertisements in the California Agriculturist. It ever has been and will continue to be our aim to conduct our monthly strictly in the best interests of its readers, guarding its columns against the intrusion of anything that is not honorable and worthy of attention.

We feel that the trust reposed in or accepted from us is a sacred one, and purpose to so conduct the paper that none who are well-meaning can take exceptions to it, while all who love and respect the right shall be pleased to continue to be its readers and our friends.

Ramie and Jute.

Of these products the Commissioner of Agriculture says;

"There is, perhaps, no one subject of agricultural production in which I have taken more interest than that which relates to fibrous plants, especially ramie and jute. These have been brought into notice within the last four years through the influence of this department, and now they are about to assume an importance which is only beginning to be known. Both these plants will grow successfully in all our Southern States, and especially in California. The impediment heretofore to their production has been the difficulty of separating the fibre from the gummy principle and green covering of the plants. But this problem, it is believed, has been now solved by the invention of machinery, which, with the aid of certain acids, separates the fiber perfectly and economically. The ramie is a native of India and China, where the work of separating the fiber is done by hand at a cost of $150 per ton. The latest patentee of a machine for separating the fiber claims that the cost of separating it will not exceed $30 per ton. It is a beautiful and lustrous staple, in strength and brilliancy almost equal to silk; in fact, most of the dress goods made to imitate silk fabrics are made in part of ramie, and its value now in England is £75, or $375 per ton; and it is said that in California 1,200 ponnds of this fiber may be produced on one acre. If these anticipations be realized, of which there is now a reasonable hops, the country may anticipate the prosecution of a new, useful and profitable industry. Jute produces a fiber of a coarser quality, but admirably adapted to cordage and bagging, and because of its length and strength, greatly superior to either flax or hemp."

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

Our Patrons will please bear in mind that renewals and remittances are now in order and that we, on our part will be pleased to credit the same on their accounts, sending to them receipts for the amount. We send statements of account to many of our subscribers this month. These are not in all cases duns, but are statements of each subscribers standing upon our books, that all may see how they do stand, whether paid up fully or not. Of course we expect, what every honest man will admit to be right, pay for the JOURNAL, when our good subscribers feel ready to remit. A few of them are always prompt, many are rather slow, and several are sadly delinquent, while occasionally one never intends to pay and after awhile stops the paper without paying. The sooner the latter class stop the better for us. But we are always willing to wait a convenient length of time on any well intentioned person for his or her subscription. And we are also willing to send to any one wishing to take the AGRICULTURIST on trial, *three months free*. Every subscriber, old or new that pays one year in advance, will be entitled to a premium and it will be credited to his account until he chooses from our list what it shall be.

Peas sown before the first rains are some of them in blossom. The frosts of winter will be sure to check that proclivity, and although they will grow all winter, they will not be likely to bear before March, unless this is an exceptional winter. Frosts may soon be expected that will singe tender things generally and stop all lavish growth of green plants till the warm days of February.

Country Gentleman is a term that has been applied East to a class of farmers, who having acquired wealth in some business operations, have country seats and farms as well as city residences. In this State, and particularly in Santa Clara valley, quite a number of farmers with their families reside in town a portion of the season—generally during winter months, where the children can have the best educational advantages, and the family can attend lectures, and enjoy all the benefits that an advanced civilizatinn can give. It matters not whether one is rich or poor—whether they can own the house they occupy or not, we rather like the plan. While the boys and girls are attending the institutes, it is perhaps a matter of economy for the family to live in town. Then in spring and summer all can go back to the farm, and work together for natural education and means, as they did in town for knowledge of books and ideas. We like the idea of the family keeping together. The old folks need city advantages as well as the young, and it is nice for the father and mother to enter into society with their children, assist them in their studies and sports, and enjoy with them as many plivileges as possible. As civilization progresses we expect to see more of this co-operative country and city life. The old folks and the young folks need it mutually.

We are glad to learn that there is some redress for the farmer or gardener who is imposed upon by dealers selling poor seed. There has been much complaint, and with reason, on this coast, that it is almost impossible to get good seed from dealers. It should be made to the interest of dealers to sell none but reliable seeds, and a little "justice" might bring them to an appreciation of that fact. The *Rural New Yorker* says: "A decision has just been made in the Court of Common Pleas in New York City which is of great importance to seedsmen, farmers and gardeners. In the case of Van Wyck vs. Allen, Judge Robinson has fixed the rule regulating the damages to which a seedsman is liable for selling inferior seed. He held that the plaintiff was entitled to as much damages as he might reasonably have expected from the crop of the kind of vegetable the seed of which he supposed he was buying; less, however, the cost of the care and trouble he expended after he discovered the crop was not of the kind he had a right to expect."

The Season so far has been a remarkable one. The copious rains of November came dribbling along so as to thoroughly saturate the soil without causing floods. Since the grass first started in October, it had grown without hindrance, and in the second week in December is a half-knee high. With a straw stack to run to, cattle will not only live, but on the fresh feed keep in good order all winter. The thorough winter soaking of the soil has insured good crops of grain and hay the coming season. There has been no frost at this writing to kill tomato plants or squash vines. Many deciduous trees have not cast their foliage. Tender plants are in blossom and the warm sun after the rains is like spring.

Orange Culture is no longer considered an experiment in all the lower valleys of California, and in the mountains below three thousand feet altitude in many localities the orange will do finely. It is the opinion of many good judges that finer flavored oranges can be grown here than at Los Angeles. Be that as it may, it is certain that orange trees will grow finely here, and the fruit will also compare favorably with the oranges of any other country. The trees are ornamental evergreens, and more attention should be paid to their culture.. Young trees should be sheltered from frosts. Although the frost is not likely to kill, it will injure them. A good way to shelter them is to stick three or four stakes around them and tie the top ends together, allowing a little space above the tree. Then sacking or straw could be drawn and tied about these stakes, making a sort of wigwam shelter that would exclude frosts and preserve the foliage and tender tops from injury until after the frosty season is over. Large trees do not need such shelter.

Cherry Trees in an Apple Orchard—Mr. Charles Caine, an old orchardist, of San Jose, two years ago planted cherry trees among full-grown Newton Pippin apple trees in an orchard. The apple trees were standing about eighteen feet apart, close enough one would think, but Mr. Caine planted two-year old, cherry trees between the trees in every row. The result so far is a splendid growth of the cherry trees, which are much more stalky and vigorous than those planted in open ground. The apple trees bear quite as well as before, and promise to bear as well for years to come. This innovation bids fair to prove a grand success. We have long been in favor of closer planting than most any other party, but Mr. Caine pegs a hole ahead of us in this instance. We will watch his experiments and results from year to year. Mr. Caine cultivates his orchard very thoroughly and feels satisfied that he will reap a double profit from it soon.

The Whiskey Frauds that have been unearthed lately show that our liquor men, who claim that they support the Government by paying licenses and taxes, are quite as corrupt as patriotic. They seem to be inspired with some of their own alcoholic spirit—the spirit of the Devil. Their business is to get all the money they can without giving in return what is of value to the human race, directly or indirectly. Defrauding the Government is the least of their sins. It would be cheaper in the end to support them all in luxury, without their doing other evil, than to do it, as is now the case, at a double expense—expense of money, and of the moral sense, health, happiness and lives of thousands annually. What better can we expect than fraud from a class of men whose avocations are calculated to spread ruin and desolation over the land.

NEAR to any great supply of manure from livery stables and other city sources, the soil can be compensated, and, indeed, be forced to such a degree of fruitfulness, that it is not of the least consequence how frequently crops of the most exhausting characteristics succeed each other.

CHROMOS.

We have on hand a few more of the choice Oil Chromos—"Romeo and Juliet," "At the Well," "The Birds," and "The Chicks." Those preferring Chromos to books can have one of either of these on each subscription.

☞ To any little boy or girl who will send a new subscription, we will send both "The Birds" and "The Chicks," postpaid. Our Childrens' Department the coming year will be a feature in the AGRICULTURIST.

Poetry.

Autumn of Life.

FLING down the faded blossoms of the Spring,
Nor clasp the roses with regretful hand;
The joy of Summer is a vanished thing;
Let it depart, and learn to understand
The gladness of great calm—the Autumn's rest,
The peace—of human joys the latest and the best!

Ah! I remember how in early days
The primrose and the wild-flower grew beside
My tangled forest paths, whose devious ways
Filled me with joys of mysteries untried,
And terror that was more than half delight,
And sense of budding life, and longings infinite.

And now I remember how, in Life's hot noon,
Around my path the lavish roses shed
Color and fragrance, and the air of June
Breathed rupture—now these Summer days are fled;
Days of sweet peril, when the serpent lay
Lurked in every turn of life's enchanted way.

The light of Spring, the Summer glow, are o'er,
And I rejoice in knowing that for me
The woodbine and the roses bloom no more,
The tender green is gone from field and tree;
Brown barren sprays stand clear against the blue,
And leaves fall fast, and let the truthful sunlight through.

For me the hooded herbs of Autumn grow,
Square-stemmed and sober, mint and sage,
Horehound and balm—such plants as healers know;
And the decline of life's long pilgrimage
Is soft and sweet with marjoram and thyme,
Bright with pure evening dew, not serpent's glittering slime.

And round my path the aromatic air
Breathes health and perfume, and the turfy ground
Is soft for weary feet, and smooth and fair
With little thornless blossoms that abound
In safe dry places, where the mountain side
Lies to the setting sun, and no ill beast can hide.

What is there to regret? Why should I mourn
To leave the forest and the marsh behind,
Or towards the rank, low meadows sadly turn?
Since here another loneliness I find,
Safer and not less beautiful—and blest
With glimpses, faint and far, of the long-wished-for Rest.

And so I drop the roses from my hand,
And let the thorn-pricks heal, and take my way
Down hill, across a fair and peaceful land
Lapped in the golden calm of dying day;
Glad that the night is near, and glad to know
That, rough or smooth the way, I have not far to go.

Nature's Nobleman.

Away with false fashion, so calm and so chill,
Where pleasure itself cannot please;
Away with cold breedings that faithlessly still
Affects to be quite at its ease;
For the deepest in feeling is highest in rank,
The freest is first in the band,
And nature's own Nobleman, friendly and frank
Is a man with his heart in his hand.

Fearless in honesty, gentle, yet just,
He warmly can love, and can hate,
Nor will he bow down with his face in the dust
To Fashion's intolerant state:
For best in good-breeding and highest in rank,
Though lowly or poor in the land,
Is nature's own Nobleman, friendly and frank—
The man with his heart in his hand.

His fashion is passion sincere and intense,
His impulses simple and true,
'Tis tempered by judgment and taught by good sense,
And cordial with me and with you;
For the finest in manners as highest in rank,
It is you, me, or you, man, who stand
Nature's own Nobleman, friendly and frank—
A man with his heart in his hand!

Out From the River.

Close her eyes tenderly, do not despise her—
Gone is the spirit for judgment above;
She was destitute—none to advise her,
She was so beautiful—true to her love.

Homeless and penniless, he who adored her
Stricken in youth by the cold hand of death;
Gone was all comfort the world could afford her;
Soon she grew weary, and sickened to death.

She was a stranger to shame, but the tempter
Plied her poor soul with his subtlest arts,
Bravely she conquered—but God will exempt her.
Some said that she with dishonor had part.

It was false; but the slanders filled her with sadness
Pointed the finger of scorn at her head!
She in wild agnoy, driven to madness,
Rushed to the river; and here she lies dead.

Close her eyes tenderly, thou who art wiser,
Peacefully fold the poor hands on her breast;
Do not be merciless, do not despise her,
Pity her loneliness—lay her to rest.

The Apple Bee.

Twenty years and three! Ah me! Twenty years and three.
And there we sit—a basket of apples on my knee;
Busy fingers pare and slice, but busy thoughts will go
Back to a happy, blissful time, twenty-three y'rs ago.

The scent of the fragrant apple, the scraping sound of the knife
Take me back o'er a lapse of time to a scene in earlier life;
Take me back to a country home, a home I no more may know.
Back to a rustic apple-bee, twenty-three y'rs ago.

Back to a farmer's kitchen, in Autumn eventide,
The basket of apples is on my knee, and the dear one at my side;
Happy, smiling girls and boys as thick as they can stow,
Paring and slicing apples, twenty-three years ago.

I live again those golden hours, I see again that happy throng
I listen again to the sound of mirth or the long-forgoten song;
Blushing apples and blushing cheeks, like visions come and go,
And I steal a glance at those bright eyes, twenty-three years ago.

Do you remember, dearest, the words we whispered then?
And does the spell of the golden hours come back in dreams again?
Do you remember those apple peels we o'er our heads did throw,
Anb the letters they made on the sanded floor, twenty-three years ago?

I wonder if the boys and girls keep up those gatherings yet,
Those good old-fashioned apple-bees they surely don't forget;
I wonder, wife, if our bonny boys will ever, ever know
The joys of that rustic apple-bee, twenty-three years ago!

Fallen Leaves.

The wint'ry breeze disrobes the trees
And leaves them sad and cheerless,
Whose open arms dread no alarms,
Like giants bold and fearless.

The withering blast comes rushing past
And grasps the leaves in cold embrace,
Till on the ground their glow is found—
Their beauty perished in its place.

The Summer flew and Autumn too,
Then chilly night and morning
Came down amain, with ice-cold rain,
And smote them without warning.

They trembling pass across the grass,
Or on the path of gravel,
Making a bed soft to the tread,
Where children like to revel.

The rustling noise delights the boys,
Who are in but life's dawning.
While from the trees by slow degrees.
Comes signs of death-like warning.

Like flocks of quail, away they sail,
A whirring, golden column,
Leaving all pale to meet the gale
The maples bare and solemn.

They pile the ground in heaps around;
I hear in walking through them,
A wrestling voice, as if they called
To one who loved and knew them.

—The Hartford Times.

Work.

BY ALICE CARY.

Down and up, and up and down,
Over and over and over;
Turn in the little seed, brown and dry
Turn out the bright red clover,
Work, and the sun your work will share,
And the rain in its time will fall;
For nature, she worketh everywhere,
And the grace of God through all.

With hand on the spade, and hearts in the sky,
Dress the ground and till it;
Turn in the little seed, brown and dry;
Turn out the golden millet.
Work, and your house shall be duly fed;
Work, and rest shall be duly won;
I hold that a man had better be dead
Than alive when his work is done!

Down and up, and up and down,
On the hill-top, low in the valley;
Turn in the little seed, dry and brown,
Turn out the rose and lily.
Work with a plan, or without a plan,
And your ends they shall be shaped true;
Work and learn at first-hand like a man—
The best way to know is to do,

Down and up till life shall close,
Ceasing not your praises,
Turn in the wild, white Winter snows;
Turn out the sweet Spring daisies,
Work, and the sun your work will share,
And the rain in its time will fall;
For nature, she worketh everywhere,
And the grace of God through all.

Song of the Seasons.

Gaunt Winter flinging flakes of snow,
Deep burdening field and wood and hill;
Dim days, dirk nights, slow trailing fogs,
And bleakened air severe and chill,
And swift the seasons circling run—
And still they change till all is done.

Young Spring with promise in her eyes,
And fragrant breath from dewy mouth,
And magic touches from the nooks
Of budding flowers when wind is south.
And swift the seasons circling run—
And so they change till all is done.

Then Summer stands erect and tall,
With early sunrise for the lawn,
Thick foliaged woods and glittering seas,
And loud bird chirpings in the dawn.
And swift the seasons circling run—
And so they change till all is done.

Brown Autumn, quiet with ripe fruits,
And haggards stacked with harvest gold,
And fiery flushes for the leaves,
And silent cloud-skies soft controlled.
And so the seasons circling run—
And still they change till all is done.

Swift speeds our Life from less to more,
The child, the man, the work, the rest,
The sobering mind, the ripening soul,
Till yonder all is bright and blest.
For so the seasons circling run—
And swift they change till all is done.

Yes, yonder—if indeed the orb
Of life revolves round central Light,
For ever true to central force
And steadfast, come the balm or blight.
And so indeed the seasons run—
And last is best when all is done.

1775—1875.

Looking back a hundred years,
And comparing the now and then,
It seems to me that in spite of fears
The country has earnest men,
As willing to draw the sword for right,
As ready to wield the pen.

It seems to me that in faithful hearts
The currents yet ebb and flow,
With a constant motion that still imparts
As steady and clear a glow
Of zeal for freedom's glorious arts,
As a hundred years ago.

It seems to me that in field or forge,
By river and by rill,
In fertile plain and mountain gorge,
In city or hamlet, still
They live as they did in the days of King George,
Of Concord and Bunker Hill.

I do not know that the hands are weak,
Or the brain unused to plan;
That the tongue delays the truth to speak,
Or the foot to march in the van;
But I know full well that we need not seek
In vain for a Minute Man.

There are men to-day that would stand alone
On the bridge Horatius kept;
There are men who would fight at Marathon,
Who would battle with Stark of Bennington,
When flashing from sabre and flint-lock gun
The fires of Freedom leapt.

It is well to look back with pride and boast,
It is better to look ahead;
The past to all is a dream at most.
The future is life instead;
And standing unmoved at your duty's post
Is truthfully praising the dead.

The Absurdity of It.

It is all very well for the poets to tell,
By way of their song adorning,
Of milkmaids who rouse to manipulate cows
At five o'clock in the morning;
And of many young mowers who bundle out-doors—
The charms of their straw-beds scorning—
Before break of day, to make love and hay,
At five o'clock in the morning:—

But, between you and me, it is all untrue—
Believe not a word they utter.
To us milkmaid above is the finger of five
Bring beaux—or even bring butter.
The poor sleepy cows, at best to arouse,
Would do so, perhaps in a morning;
But the sweet country girls, would they show their curls
At five o'clock in the morning?

It may not be wrong for the man in the song—
Or the moon—in a manner to settle,
To kneel in wet grass, and pop; but, alas!
What if he popped on a nettle?
For how could he see, what was under his knee,
If, in spite of my friendly warning,
He went out of bed and his house and his head,
At five o'clock in the morning?

It is all very well for such stories to tell.
But if I were a maid, all-forlorn-ing,
And a lover should drop in the clover, to pop,
At five o'clock in the morning,
If I liked him, you see, I'd say, "Please call at three:"
If not, I'd turn on him with scorning:
"Don't come here, you flat, with conundrums like that,
At five o'clock in the morning!"

FRUITS AND FRUIT TREES—BEST VARIETIES FOR PLANTING.

In our annual advice as to the best varieties of fruit trees to plant for a home orchard, and for profit, we find it necessary to repeat the most important parts of previous articles; in fact, we simply revise our former ones, making such corrections and alterations as the experience of our best orchardists have developed. There may be some good varieties of fruit that we have not included in our list, but certainly we have given none but what are first-rate and well adapted to the peculiar climate of California. We do not give selections from guess work, nor in the interest of any party, but have taken the most careful pains to be as correct and reliable as possible for the general good of our readers.

There is one thing in favor of tree-planters this season—a very important one—and that is the soil is well filled with moisture. This makes it a very favorable season for planting, and one that our farmers should take advantage of. We have never known a more promising opportunity for tree-planting, particularly on upland or dry farms. For a family orchard, more varieties than for a market orchard should be selected. A succession of ripening should be chosen from early to late. A few early varieties are enough, as what are not at once consumed will decay. More trees of late sorts should be chosen, for the keeping qualities of late ripening fruits will extend the time for consumption. The best fruits for canning are neither the very earliest nor the latest varieties; and as putting up fruits hermetically has come to be an important consideration, in addition to drying fruits, more trees of medium ripening kind are required for a complete family orchard than formerly.

For a market orchard but few varieties are profitable to cultivate, and they should be grown with a view of commanding the highest prices; consequently they should be only of the handsomest sorts, and such as will ripen or be ready for market at the season when there is the best demand for them. The locality and effect of climatic conditions must be considered in the matter of selecting fruits for market. For instance, at Marysville and Sacramento the very earliest apples, pears, apricots, peaches, cherries and grapes, will bring the best prices in San Francisco, because in these localities they can produce early fruits several weeks ahead of many other portions of the State. At San Jose, and within the influence of the sea climate, such apples as the Alexander, Maiden's Blush, etc. —Fall apples—are as profitable as any apples that can be grown here. We can get them into market after the run of early apples is over and before the Oregon Winter apples flood the market. Winter apples are also profitable to cultivate in San Jose. But, owing to the nearness to the sea and the cool climate, San Jose is six weeks behind Marysville in ripening early apples. While the early apples that grow at Marysville are very fine, the Fall and Winter fruits grown there are comparatively inferior. At San Jose superior apples can be produced of any variety. Near the bay, currants, gooseberries, strawberries, etc., of superior quality are produced, while in the hotter interior valleys few or none are grown, as they will not do well. So great is the influence of climate on fruits that it is a matter of much importance, and, in connection with the demands and supply of markets, it should be well understood by orchardists.

There are special varieties best suited to dry localities. For instance, where the Rambo and Wine Sap varieties of apples will dry up so as to be worthless, the Skinner's Seedling and Gravenstein will do very well. The Newton Pippin will make a better apple on dry soils than the White Winter Pearmain, but the former falls off badly, while the latter hangs on. The home orchard should be set where it will be handy to the house, and where it will add beauty to the place. When one makes orcharding a specialty for profit other things should conform to that. Where there is not a natural shelter for an orchard one should be provided by planting trees—evergreens are best—on the two sides from whence prevailing winds blow. Acacia, pepper trees, and Monterey cypress are perhaps the best to plant in hedge form for shelter. It will certainly pay to provide some break-wind, and even willows are better than nothing.

Laying off the orchard, set nearly everything at a uniform distance, and not over 16 feet apart where exposed; when well sheltered, not over twenty feet aprrt. The experience of our best orchardists is in favor of closer planting than is advised by Eastern orchardists. To make true lines and set trees in perfect line, is much neater than careless planting. As an aid to this, a long wire with marks made by tying on strings securely at regular distances we have found to be an excellent line for staking off an orchard—a twine will stretch too much. Find a baseline for one side of the orchard, then get a true right angle at one end cornering on the first line. Then, by setting the wire by the stakes of either side and running parallel lines, sticking the stakes at each mark on the wire, the rows will come perfectly in line without any squinting or laborious sighting with the eyes.

Digging holes for the trees is not such a terrible job as some might think. We would make the holes just deep and broad enough to take the roots at their natural depth without cramping. Let the hole be a little the deepest at the edges and highest in the centre, so that the roots will incline a little down as the tree rests upon the bottom of the hole. Be sure that each root is laid in a natural position, and that nothing but clean earth is placed in contact with the roots, as manure or trash of any kind induces a mould or fungus growth that is poisonous to the tree. What we said last year as to the matter of planting trees we repeat: There are a great many hobbies that are passing current as coin in orchard matters that should be exploded, which are yearly repeated by nurserymen and newspapers about digging immense holes and putting trash under trees, etc. Our advice is, don't put any manure or other trash under your trees when you plant them. Put no manure or rubbish into the holes about the roots. Plant the tree at about the same depth as it grew, in clean soil, laying the roots in a natural position pointing a little downward. You may put all the manure on the surface, after the tree is planted, that you please, but remember, never put manure next to the roots nor under the tree in our dry climate. Tread the soil firmly about the tree so that the winds shall not shake it loose in the soil, particularly where the soil is light. Preparing of the soil for an orchard, we believe it best to plow deep, narrow furrows, and cross-plow and harrow, with long teeth, weighted harrows, so as to thoroughly pulverize the soil. At any rate, let the pulverization of the soil be perfect, whether you plow deep or shallow.

As to the after care and treatment, keep the surface of the soil throughout the orchard loose and light, and free from weeds, all through the season, and especially during Spring and Summer. Never sow grain or grass in the orchard, no matter who advises it. If the land is naturally moist, or can be irrigated, vegetables may be planted and kept cultivated between the rows; but on dry soil, let the trees have all the advantage of clean, well-pulverized soil, so that they can resist the drouth of Summer and grow rapidly. An orchard stunted while young can never fully recover. The best preventative against borers is to shade the stem of the trees. This can be best done by winding strips of cloth about the trunk, from the ground up to the limbs. Be sure to cover the base of the tree, as the borers are most likely to attack the tree close to the ground. Another good way is to put two clap-boards on the south and west sides. Set them firmly into the ground; they will shade the trunks for years, and prevent borers as well as keep the bark fresh and healthy. Selecting the trees is a matter of very much importance. Let every tree be of healthy growth and of symmetrical form. Stunted trees, or such as look bad in the nursery, are seldom worth having at any price.

FOR A FAMILY ORCHARD.

Apples—*Early*—Three Red Astrachan; 2 Red June; 2 White Astrachan; 2 Golden Pippin; 3 Skinner's Seedling, or Maidens' Blush; 1 Gravenstein; 1 early Sweet Bow, for baking. The Golden Pippin is a very tart apple, making it desirable for cooking and drying. It does not dry white as some; not so fine for market as for home use. The Gravenstein falls from the tree badly before ripening, but is fine for eating. Skinner's Seedling hangs well to the tree; is an extra eating and cooking apple.

Early Winter Apples—6 Yellow Bellflower; 2 Johnathan. *Late Keeping Apples*—10 Yellow Newton Pippins; 3 White Winter Pearmain; 1 Nickerjack, and 1 late Talman's Sweet. This makes 34 apple trees, all extra good kinds for California. There are other sorts, favorites with some. Of course we advise each person to have a tree of *his* favorite in addition to this list.

The apples that dry white, and are in demand by the Alden factories for dessication, are Skinner's Seedling, Gravenstein, Smith's Cider, Fall Pippin and Yellow Bellflower. For an apple orchard for profit, where winter

apples ripen late, as in Santa Clara county, and keep well, the Newton Pippin is the very best one to plant. Some orchardist say the *only* one from one acre to a hundred acres would be the Newton Pippin.

Pears—*Early and late*, as they come in succession—Two Dearborn Seedlings; 1 Madaline; 2 Buerre Gifford; 5 Bartlett; 1 Sickle; 1 Flemish Beauty; 3 Buerre Hardy; 2 White Doyenner 2 Glout Morceau; 3 Winter Nellis; 2 Easter Buerre. There is no better flavored pear for drying or canning than the Bartlett; but owing to the softness of the core when ripe enough to dry nicely, it will not hold to the fork of a paring machine, and is not so profitable for the drying factory as the Flemish Beauty, which is round, smooth, easily worked on a machine, and is one of the very nicest drying pears. Swan's Orange and Glout Morceau, are also fine drying pears, where machinery is used. The best shipping pears for Eastern markets, are the Winter Nellis and Easter Buerre. At one time the Bartlett and Buerre Hardy were thought the best, but they do not keep well, and arrive there when Eastern pears are plentiful, while the winter varieties get there in a sound condition and at a time when Eastern pears are not brought into competition to lower prices.

Quinces—Two Orange variety. Quinces are excellent baking fruit, and for canning, either alone or with pears.

Plums—One Cherry Plum; 2 Early Golden Drop; 2 Royal Hative; 2 Jefferson; 3 Columbia; 6 Green Gage; 5 Ickworth's Imperatrice; 2 Coe's Late Red. The latter plum will last till Christmas, and is desirable chiefly for its late keeping qualities. Best for canning—Green Gage. Best plums for drying, are Jefferson, Washington, Ickworth's Imperatrice, Columbia, Rein Claud de Bavey, General Hand. Soft, mushy plums are not desirable for drying, but the plum that has a rich flavor, solid pulp and is easily pitted, is a drying plum. The Quackenboss is called the best shipping plum, owing to its beauty and keeping qualities.

Peaches—One Hale's Early; 1 Early York Serrate; 1 Crawford's Early; 3 Grosse Mignonne;—one of the finest peaches in cultivation; valuable for canning; 1 Late Admirable; Crawford's Late; 2 Old Mixon, cling; 2 Lemon, cling.

Nectarine—One Hardwick; 1 New White.

Prunes—Two Grosse Prune de Agen; 3 Petti Prune de Agen; 2 Fellenburg. The Fellenburg, or German Prune is the best drying prune, and is coming into high favor on that account very fast. It pits *naturally*; is high flavored, with firm flesh. The Petti Prune de Agen stands second, but is rich and fine, though small. The Grosse Prune de Agen is best for shipping, owing to its beauty, size and solidity. It adheres to the pit too tenaciously to be a favorite for drying.

Apricots—Two Early Golden; 2 Moorepark. Nice for cooking, canning and drying, as well as for eating.

Cherries—Two each of Governor Wood, Black Eagle, Black Tartarean, Black Arabian, Coe's Transparent, Kentish or Pie, Cleveland Biggareau, Napoleon Biggareau. The Black Tartarean is the most profitable market cherry, owing to the regular and good bearing quality of the trees, and to the solidity and carrying quality of the fruit, which will not discolor when bruised, and is large, handsome and of fine flavor. There is no better canning fruit than the cherry, also good dried.

Mulberries—Black and Downing's everbearing—trees ornamental as well as good for fruit.

Figs—Take a variety. The Black Brunswick, White Smyrna and Brown Turkey are as good as any.

Oranges—Don't fail to plant out several for fruit and ornament. The Navil, St. Michael and Sicily are leading grafted sorts.

Lemon and Citron—One of each sort, at least.

Walnuts — Half-dozen each of English, American Black, and Pecan.

Chestnuts — Half-a-dozen trees, including American, Italian and Spanish.

Almonds—Six Languedoc, 3 King's Paper Shell.

Mespulas—Two trees.

Olive—Two trees.

This selection will make a respectable orchard for any farmer for family use. Persons living in the hot interior valleys should consult orchardists there as to what particular early varieties are most profitable for early market. For a family orchard the varieties we have mentioned are very choice and succeed each other admirably.

Grapes—Two vines each of White Sweetwater, Isabella and Catawba for a trellis, 10 Rose Peru, 10 Flame Tokay, 50 White Muscat of Alexandria, 10 Black Hamburg, 10 Black Malvoise, 10 Black Morocco. The White Muscat of Alexandria is the very best raisin grape. Any family can make their own raisins nicely and send some to market. The best shipping grapes are White Muscat of Alexandria, Flame Tokay and Rose Peru, so far as tried for profit. For canning, high-flavored grapes are best.

Berries—Blackberries—50 Lawton, 50 Kittertinny; 25 Raspberries; 25 Houghton Seedling Gooseberries; 25 Cherry Currants; of Strawberries the Longsworth Prolific and Jocunda prove the best.

Distance of Planting Small Fruits.—For convenience of cultivating and economy of ground we advise setting the berries at one end of the grape patch in rows the same distance apart.

Plant Grapes 8x8 feet; the Blackberries about 8x3 feet; the Gooseberries and Currants 8x3 feet; the Raspberries 8x3 feet; Rhubarb 8x4 feet. The rows can be all 8 feet apart *one way* for convenience in cultivating, which is handier than odd distances.

Plant Strawberries, Asparagus, etc., in beds or in rows two feet apart, as is most convenient.

The Grangers are circulating a petition praying the next Legislature to pass a bill, "fixing the rate of attorneys' and lawyers' fees where no special contract is made."—*Sacramento Bee.*

Not less than $300,000 worth of oysters will be sold from the Shoalwater Bay beds this season, the gathering and moving of them forming one of the chief industries of Washington Territory.

TARLETON ORCHARD CULTIVATOR.

The best implement for working up weeds in an orchard is probably the one invented and used by Mr. G. W. Tarleton in his fine orchard near San Jose. The wood-work consists of three beams placed parallel about 16 to 18 inches apart and strongly connected by braces, and the handles similar to common cultivator handles. To each of these beams is attached, by standards 14 inches long, a double-winged hoe, made of 2^1_2 inch spring steel, with a point similar to a plow-point, the point pitching down a little to hold steadily to the ground when working. The wings are 18 inches long, level on the edge, not flat but slanting downward some 25 degrees, to give the weeds, when cut off, an upward send. The ends of the wings are 21 inches apart, which spread gives about the same angle to each share as a common plowshare has. In front of each hoe is attached to each beam by the common half-circles, a common eight-inch plow wheel, to grade and regulate the depth of each hoe, so the cultivator rests on the three wheels.

Mr. Tarleton grades his to cut two inches deep only. The implement is not calculated to cut over three inches deep, and will not stand deep running, although made of best spring steel to give elasticity and strength to the shares or flanges. We saw this cultivator in use, and it works exactly as desired. Mr. Tarleton does not cultivate his orchard ever more than two to two and one-half inches deep, but cuts every weed out clean. Two horses will run this cultivator with ease in wet soil, and in dry, light soil one horse is enough. After going over the ground with this and cross cultivating, a harrow is used to finish the work. In dry weather and when the soil is not wet by irrigation the weeds are all destroyed by the cultivator, so that the harrowing afterwards is dispensed with.

We have taken some pains to describe this implement, as it has been in use for some years and has been adopted by several of our best orchardists, and is universally pronounced to be the very best thing for the purpose ever gotten up.

We did not enquire the cost, but any one at a distance wanting one can have it made to order by dropping us a line, in the best manner and at the lowest cost.

Farming at the South.—In calling attention to a meeting of farmers at Petersburg on Tuesday of this week, the Richmond *Whig* takes occasion to say: "The cause of agriculture is receiving accessions of energy and ambition every day in Virginia. Some of the best intellects of the State are turning to it with more exclusive devotion now than has ever been the case before. The Granges are great adjuncts to the agencies that are working for its advancement. The mental, as well as physical labor of the farmer is in process of being better systematized. The tillers of the soil are beginning to take the touch of elbow among themselves more than they ever did. They are organizing more closely and conferring more frequently and more freely. These are cheering signs for the old State, and it brightens and heightens the hopes in our hearts to see them." And what the *Whig* says of Old Virginia, may be said of most of the Southern States. It is the "touch of the elbow" that does the business.—*Prairie Farmer.*

Correspondence.

[For the CALIFORNIA AGRICULTURIST.]

A CHRISTMAS STORY, FOUNDED ON TRUTH.

BY NELL VAN.

T WAS CHRISTMAS EVE IN Minnesota. The snow-covered earth reflected the pale moonbeams, while the merry tinkle of passing sleigh-bells fell cheeringly on the ear at intervals.

A group of young people were gathered around the blazing hearthstone in good Aunt Myra's sitting-room, engaged in telling stories. Beside the chimney hung stockings of various sizes; for what is Christmas to the wee ones without "Santa Claus" and stockings for him to fill.

Glance at the group sitting there in the firelight, with their shadows thrown upon the white ceiling: A bright-eyed, fair-haired boy lounged on the rug, with one arm around his favorite—a black-and-tan terrier—and his other resting on the shoulder of black-eyed Georgie, his cousin from California, who had come to pass the winter at Aunt Myra's. She was a tall, rosy-cheeked gypsy, with hair like a raven's wing clustering about a broad, intellectual brow. Her teeth were like pearls, and her full, cherry-like lips were ever ready to kiss or laugh, as the occasion offered. Laura and Fanny came next—the one, a roguish, brown-eyed puss, and the other stately and reserved, her cold grey eyes and queenly brow demanding homage from all by her apparent intellectual superiority. Jenny was there, a little fairy, sitting on a footstool at Aunt Myra's feet with her head in her lap, looking from one to the other and calling for more stories in every lull in the conversation.

It was Georgie's turn, they all said, as Aunt Myra stirred the fire and tossed on another log. "Yes, Georgie's turn," said Will, snapping his thumb and finger in the direction of his cousin; "come now, tell us something stunning about California life." "Oh, yes!" exclaimed the others, in concert.

Glancing from her companions to her aunt she said: "I cannot think of a good story, suitable for the occasion, but I can give you a bit of personal experience that happened to me when I was a child; for now, you know, I'm quite grown up. One begins to feel old at sixteen, and it was ten years ago to-morrow that we were all so happy."

"We are all ready, my darling," said Aunt Myra. "It seems but yesterday when you were here, a babe four months old, when your dear papa was carried out from our sight and laid in the churchyard that sad, sad Christmas day. Sixteen years, you say, since then! Ah me, how time flies! but you are here again, the living likeness of that most precious one. Yes, tell us something of your California life—'a true story,' as the children say. I, too, like them best."

"Well, then, imagine me a little frolicsome child of six, who was spending the Summer in Aunt Eleanor's quiet home. Her neat, white cottage was shaded with jessamine and honeysuckle, and shrubbery filled the door-yard, among which we children rambled to our hearts' content. There was a birthday party for me, I remember, and little boys and girls were there all decked out in gay sashes and neckties, while gayest among them all was Aunt Eleanor herself, who started plays for us and played the piano while we danced. Well, the next day found me a little fretful and uneasy. It was the reaction after such intense excitement. My aunt tried various ways of amusing me, but nothing would do but I must go somewhere. My playmates were all in school, so Auntie chanced to think of an unpaid bill which she asked if I would like to go and settle for her. Delighted with the idea of paying out money, I started up and expressed my willingness to go at once. Taking from her pocket a twenty-dollar gold-piece, she folded it in the cabinet-maker's bill, and placing it in my hand said, "Now, Georgie, hold it fast and do not lose it." Of course I promised faithfully, and with my light sun-hat on my arm, I started out at full speed. Now in California we have long seasons without rain, when the earth is dry and parched, and the roads cut up, leaving dust often several inches in depth.

"The village where my aunt lived was one of considerable size and in a manufacturing district, so the roads all about were much traveled, and consequently quite dusty. I scampered along, singing as I went, till arriving within sight of the shop where I was to go, I missed the gold-piece from my hand. The bill lay folded in my fist but no money was there. Back I went over the same path, slowly returning to my aunt with the mournful news that I had lost the money.

"'Lost the money, Georgie!' It cannot be. Let's go together and look for it.' She slipped on her hat and slowly and carefully we passed over the same ground, going and coming, till near nightfall, but not a trace could be seen of the coin. The neighbors became interested in the search, and with sticks to rake among the dust they came to our assistance without avail. Days passed on and cousin Tom, then a lad of ten years, insisted that some one must have picked it up while I had gone to tell the news; so whenever Aunt urged him to search more, he would say he was sure there was no use, for it could not have lain there all this time without being picked up. Do you believe in fortune-tellers, Aunt Myra? Well, about this time an old, wandering gypsy passed through the village, stopping at every house and telling fortunes in a tea-cup. Of course she tasted the hospitality of the house before she came to the tea-grounds, and most marvelous tales she related to eager listeners regarding their future. She came to Aunt and insisted that there was something in the future preparing for her—some sorrow in the past that she could explain to her. I came in to see who the old body might be, and with eyes distended she pointed her long, bony finger at me and asked where that child came from. "None of yours, sure," she added, looking suspiciously at Aunt as if I had been stolen away from somebody. I was frightened and hid my face away, but the sepulchral tones of her voice sounded in my ears for days after. It was lunch-time, I remember, for we dined in the cool of the day, and Aunt had a cup of tea set for the stranger and offered her some luncheon. After she had finished she pushed back her chair, and with the tea-cup in her hand drained off the moisture, and told Aunt then and there, she saw trouble about money.

"'Here's a man—a laboring man in shirt-sleeves and with a plaid patch in the back of his waistcoat—who picks up a piece of money—your money, ma'am. He says, as he ships it in his palm with the other hand, "That'll just pay my taxes and give me my little home free. How glad Mary'll be to know the heavens have rained down money to help us!" Have you lost any money, ma'am?' enquired she, turning full upon my aunt. Yes, there had been money lost, but who the man could be that picked it up no one could conjecture, as no person answering to the description had been seen in the neighborhood. The fortune-teller passed on and left us as much in a quandary as before, no one placing much reliance on her word.

"Shortly after this I returned to my city home, and nothing was said to Mamma about the lost money, because I hated to think of it and good Aunt Eleanor did not want to worry her with anything that could not be helped. At Christmas time, six months after, we all went over, by urgent invitation, to spend a week at Dessamine Cottage, as I love to call Aunt Eleanor's home. The early rains had settled the dusty roads and brought forth the fresh young grass. The woods through which we passed in the old fashioned stage coach were fragrant with all sorts of delightful herbs and evergreens, among which the redwood, towering to the skies, sent forth its share of its peculiar perfume. Arriving there we found my aunt and cousins all expectation, and the rooms were beautifully decorated with wreaths of evergreens, and the word, 'Welcome!' was hung opposite the door in the best parlor, where was also a fine mistletoe, under which, if a boy caught a little mate, you know a kiss is the legal penalty. Blundering in, lost in admiration, Cousin Tom led me directly under the mistletoe and kissed me saying, 'There, Georgie, I caught you first.' Nothing went amiss with me that day, though upon ordinary occasions a boy would have to smart for his audacity if he dared steal a kiss even at that tender age.

"Christmas day dawned bright and clear, and we children were up before dawn and down to our stockings. Oh, what merry times we had looking at the pretty things Santa Claus had left so prettily. After Auntie came down we were taken into the parlor, and there, in the centre of the room stood the loveliest Christmas-tree I ever saw or shall expect to see again. It was all decked with strings of pop-corn, with fancy horns of plenty filled with candy, and every conceivable toy and gift suspended from or resting on the branches. Tiny flags were mixed in and gilded balls. O, you never dreamed of a prettier sight. Our gifts were all labeled, so that it was an easy task to distribute them, and Tom in a brand new suit, with cap to match, looked most wonderful to my young eyes. Soon after breakfast, when the sun shone out warm, a walk was proposed by Master Tom, who offered to take good care of Freddy, who was just able to walk nicely. Mamma and Aunt Eleanor willingly assented, and dressed out in our very best we stepped off quite gaily. I should never forget that walk as long as I live; for what do you think? when we were walking over the same piece of road where I had passed when I lost the gold-piece there was a deal of mud, so Tom, like a careful boy, lifted Freddy over it, and glancing down, in a wheel-track he espied something shining which he picked up, and there it was—the lost twenty-dollar piece! Six months it had lain concealed beneath the dust, to be a surprise to us on Christmas day! Hastening home we held out our treasure and carry us, we related the circumstance to the astonished group. Mamma had never heard of the losing of the money, and was the more amazed to think of its being lost and found without her knowledge.

"How we danced and sung and made merry because the lost was found; and what had hung like a cloud over my childhood's vision of dear Dessamine Cottage was now removed, and Aunt Eleanor's double eagle no care had to her. What did she do with it? Why, she had it changed into two ten-dollar gold-pieces and gave one to Mamma for bringing me over to be the means of finding the lost treasure.

"My story is done; for our Christmas day will soon be here, and if it be as happy as the one we spent that year, some of you may make a yarn to amuse another group some future Christmas eve."

A FASHIONABLE RECIPE.—Take a young lady, turn her once in a breadth of satin, twice in a gauze scarf and three times in a puff of tulle; add twenty yards of flowery garlands wherewith to season the whole. The dish is then trussed up, but has not yet sufficient dressing. Something heavy, in the shape of a train is needed. It may be made of matelasse with raised flowers, or of brocade. Skewer it on well behind, and garnish with ganze butterflies, lace birds or gilt beetles. Keep very warm at the base and very cool at the top. Remove the dressing as much as possible from the upper part and pile it on below. Season with diamonds and serve up warm.

FROM SAN BENITO COUNTY.

Peach Tree, San Benito Co., November, 1875.

Dear Agriculturist: Noticing your varied correspondence, I thought a letter from this out of the way place might not be amiss.

This is most exclusively a stock country; being so far from market that grain, etc., could not be transported for what it would bring in the market of the world, even if raised.

Cattle, hogs, dairy products and poultry form the staples here. Barley is 3½ cents a pound; wheat is hard to get at any price; hay is evidently plenty, notwithstanding the dry season.

Hogs are made quite a speciality of. We have talked with several men who have had experience, and they all consider the berkshires the most paying hogs; because they are so much more hardy than the Essex, and the meat commands a higher price when cured.

Such a thing as an orchard is almost unknown up this far in the mountains. There is but one in Peach Tree, and that is a small one.

About twenty-five miles toward Hollister, here in a steep-sided canon, near San Benito, is a grist mill, belonging to Gough & Wagner. It is doing a good business in grinding feed and flour; the latter, good in quality, as we can testify from experience. Mr. Gough has a cosy little place, about a quarter of a mile above his mill, where he raises all kinds of vegetables, and has a small orchard, which will soon be in bearing; also, about four acres of alfalfa, which corroborates all that has been said in praise of it. He has cut, we understand, twenty-five tons of hay, and pastured twenty-five head of cattle on it since July, and still it presents an appearance of good feed. Altogether, Mr. Gough's place seems like an oasis in the desert.

About twelve miles north of here is the Bitter Water valley, and the water is characteristic of the name, for it is as bitter as modified gall, owing to the presence of peculiar salts, which render it purgative in character. A gentleman here, showed me a piece of rock composed of shells and sandstone. This formation is very plenty here, forming quite a feature in the geology of the country. He found several pieces of fossil bones, which he sent to the State Normal School; but has not learned as yet to what ancient monster they might have belonged.

Society here is rather mixed.

"Men of every nation;
Birds of every feather,
On a common level,"

associate and fraternise much more freely than one would suppose possible, from the diversity of tongues spoken.

It seems to be no disgrace to get drunk, especially among the Spaniards and Mexicans. The state of the Temperance question is well illustrated by the following anecdote. An old Mexican lady was describing a fandango, and in particular the supper, said she: "have cake, have pie, have chicken, and (with special accent) have *plainty whisky*." F. G.

Letter from Lompoc Temperance Colony.

Editor Agriculturist and Live Stock Journal: I have had several proofs that the Agriculturist is a good paper to carry around news.

Since my last letter from this place, inquiries come from all round the country, asking further information. A gentleman who takes a prominent part in advancing all good causes here, gives me this extract from a letter recently received from Silver City, Idaho.

"Seeing an account of the Lompoc Temperance Colony in that excellent paper the Agriculturist, I take the liberty of asking you a little more about it," etc. The writer never dreamt of seeing his own words repeated in your columns, no doubt. But I feel that you and your subscribers are entitled to the encouragement they incidentally contain.

I have only time to add that our land is selling off so rapidly and the valley filling up so fast, that another Temperance Colony is projected from a neighboring ranch or two. If the plan succeeds, it will help us much. We shall soon know, and your advertising columns no doubt will give full information to the many families that it will accommodate and prove attactive to. I like this colonizing on the temperance plan. It has so far successfully kept out the sale of whisky in our valley. People see we *mean* it, and value the exemption from the curse and expense of tippling and intemperance.

We have had a fine rain for a starter. Weather just lovely; health excellent; everybody preparing to put in large crops of potatoes, beans, corn, pumpkins, beets, barley, wheat, etc., as possible, and some orchards and alfalfa. All feel sanguine.

Yours truly,

J. P. Ross.

Deep Plowing.

The question of *deep* and *shallow* plowing is one, which though often discussed, seems to be an unsettled one in the minds of a large number of farmers.

Perhaps a farmer of twenty years experience in England and California may be permitted to express an opinion on this question based on careful and repeated experiments.

I am persuaded that the first principle in agriculture is deep plowing, but circumstances must determine *when* to plow deep.

The philosophy of deep plowing may be briefly stated thus: It furnishes a large amount of porous soil, whose absorbent qualities capacitate it for drawing moisture from below and drawing in the plentiful showers from above.

Where deep plowing and thorough cultivation go together, the finely commixed condition of the soil, makes it more receptive of the influences of *sun, air* and moisture, and more retentive of each—as well as becoming a mass of the most assimilable food for plants.

The mineral elements of the soil being found largely in the subsoil, cannot be brought into acquisition but by *deep plowing*, which disintegrating that hard mass, and freeing its elements, presents them for oxygenation, and by the free circulation of air, decomposes, pulverises and makes assimilable.

As the wheat crop depends largely on the mineral constituents of the soil, other circumstances being favorable, deep plowing is essential to the supply of its necessary food. The wheat plant is provided with a *long tap root*, which on deeply plowed land often reaches to the depth of twelve inches or more.

Barley sends out its roots more latterally and will thrive better with shallow plowing, than wheat or oats.

It does better after root crops and on light or shallow soils, maturing earlier, and is more remunerative in a dry season than wheat or oats.

The conditions of success in deep plowing, are earliness, and thoroughness of after cultivation.

In California if done as late as January, it had better not be done at all as a rule, as there is no time to weather the furrows, or break it up into a fine assimilable shape.

In this condition it is neither *absorbative* nor *retentive* of moisture; and wheat may as well be sown among stones.

Much of the prejudice against deep plowing in California arises from the difficulty of securing such a *mechanical* condition of the soil—such a fine tilth as promotes such compactness as the wheat plant demands.

To ensure success, the land should not be plowed during heavy rains nor too early after them, but if the condition of the soil warrants it, as early in November as possible.

If practicable, sowing should not take place before not much after the first week in February. A cultivator should then be used as well as a harrow, and if the weather will admit, the last operation before seeding should be followed with a good roller, the seed-drill following after, and finishing off with the harrow.

Such cultivation, other things being equal, will insure a good crop.

As supplementary to the above, when the crop is about four inches high and the surface dry enough, roll down with a heavy roller, which accomplishes the thing—consolidating the soil, assisting the plant to start out, and producing an even surface for the reaper at harvest-time.

Our old correspondent, J. B. Rumford, formerly of Plano, Tulare county, has moved to Kern Island, and reports to us that he has found an excellent locality for all kinds of vegetation. He says that land seeded to alfalfa will yield immensely, and will pay 18 per cent. or $100 per acre, annually above expenses. Corn and vegetables grow without irrigation. And there is no more sickness from ague than along the Sacramento or San Joaquin rivers. We expect a long letter from Mr. Rumford soon.

FLECKS OR SOUDS IN BUTTER.—A QUERY.

Ed. Agriculturist and Live Stock Journal:—Can you, or any of your dairyman readers, inform me what the *souds* in butter are? I have come to the conclusion that they are nothing but cream, while a great many think that they are sour milk. However, I would like your ideas on the subject.

Enquirer.

We have often noticed these "sends," as our correspondent calls them, in butter, and in our experience in dairying have noticed that sometimes they have been composed of particles of cream—tough cream that had been exposed too long and had become flecked with a sort of mould which caused the particles to adhere, and prevented the globules from separating and coming together as butter as soon as the good cream, free from such tough mould. We have also known mould to form a sort of membraneous substance, like tough skin, on or under cream that has stood too long or been exposed in a tainted atmosphere. These, like pieces of thin cuticle, would remain in the butter. The remedy is to have a clean dairy-room, thoroughly scald the pans, etc., and not allow the cream to stand too long before or after skimming. We give this as simply our own observation, and ask our dairy subscribers to send in their ideas on this subject, that we may compare notes and arrive at the true solution.

To know how to keep a tidy house and well aired apartments, to know how to select the best kinds of food, to know how to prepare them in the best manner—these are first things, and every daughter should learn them before marriage.

Stock Breeders.

International Exhibition of Live-Stock at Philadelphia, 1876.

FIRST.—The Live-Stock display at the International Exhibition will be held within the months of September and October, 1876; the periods devoted to each class and family being fifteen days, and the division as follows: Horses, mules and asses, from September 1st to 15th. Horned cattle (varieties), from September 20th to October 5th. Sheep, swine, goats and dogs, from October 10th to 25th. Poultry will be exhibited from October 28th to November 10th. 2. Animals to be elgible for admission to the International Exhibition must be, with the exception of trotting stock, walking horses, matched teams, fat and draught cattle, of such pedigree that the exhibitor can furnish satisfactory evidence to the Chief of Bureau, that:—As applied to thorough-bred horses, as far back as the fifth generation of ancestors on both sides, they are of pure blood, and of the same identical breed. As to short-horned cattle, they are registered in either Allen's, Alexander's, or the English Herd books. As to Holsteins, Herefords, Ayrshires, Devons' Guernseys, Britainys, Kerrys, and other pure breeds, they are either imported or descended from imported animals on both sides. As to Jerseys, that they are entered in the Herd Register of the American Jersey Cattle Club, or in that of the Royal Agricultural Society of Jersey. As to sheep and swine, they are imported or descended from imported animals, and, that the home-bred shall be of pure blood as far back as the fifth generation. 3. The term breed, as used, is intended to comprehend all family divisions, where the distinction in form and character dates back through years of separtion; for instance, it is held that the progeny of a pure-blood Jersey and a pure blood Guernsey is not a thoroughbred, but a cross-bred animal, and as such, is necessarily excluded. 4. In awarding prizes to animals of pure blood, the Judges will take into consideration chiefly the relative merits as to the power of transmission of their valuable qualities; a cardinal object of the exhibition being to promote improvement in breeding stock. 5. In case of doubt relative to the age of an animal, satisfactory proof must be furnished, or the animal will be subject to examination by a veterinary surgeon; and should the state of dentition indicate that the age has not been correctly stated, the person so entering as an exhibitor will be prohibited from exhibiting in any class. 6. The forms of classification for awards, as given under each head, are intended (excepting in the case of trotting stock, walking horses, matched teams, fat and draught cattle) to apply to any of the animals of pure breed that are entered for competition. 7. The Exhibition being open to the world, it is of the first importance that the best of their kind only be brought forward, as the character of the stock will be judged by the average of those exhibited. 8. Exhibitors will be expected to furnish their own attendants, on whom all the responsibility of the care of feeding, watering and cleaning the animals, and also of cleaning stalls, will rest. 9. Forage and grain will be furnished at cost prices, at depots conveniently located within the grounds. Water can be had at all hours, ample facilities being provided for its conveyance and distribution throughout the stock-yards. 10. Exhibitors must supply all harness, saddlery, vehicles and other appointments, and all such must be kept in their own places. 11. The Commission will erect ample accommodation for the exhibition and protection of live-stock, yet contributors who may desire to make special arrangements for the display of their stock, will be afforded facilities at their own cost. Fractious animals, whether Stallions, mares with foals, or bulls, will be provided with stalls of desirable character. 12. All stalls will be regularly and distinctly numbered; corresponding numbers on labels of uniform character will be given to each exhibitor, and no animal will be allowed to pass from its stall without its proper number attached. 13. Numbers *alone* will distinguish stock in the show-yards, preceding the awards of prizes. 14. The Judges of live-stock will make examination of all animals on opening day of each serial show, and will for that day have exclusive entrance to the show-yard. 15. No premium will be awarded an inferior animal, though there be no competition. 16. All animals will be under the supervision of a veterinary surgeon, who will examine them before admission, to guard against infection, and who will also make a daily inspection and report. In case of sickness the animal will be removed to a suitable enclosure especially prepared for its comfort and medical treatment. 17. When animals are taken sick, the exhibitors may either direct the treatment themselves, or allow the veterinary surgeon appointed by the Commission to treat the case. In this latter event the exhibitor will be charged for all the expenses incurred. All possible care will be taken of animals exhibited, but the Commission cannot be held responsible for any injury or accident. 18. A ring will be provided for the display of and exercise of horses and cattle. 19. On the last day of each serial show a public auction may be held of such animals as the exhibitor may desire to sell. Animals may be sold at private sale any time during their exhibition. During the period of a serial show no animal, even in the event of being sold, will be allowed to be definitely removed. 20. An official catalogue of the animals exhibited will be published. 21. Exhibitors of thorough-bred animals must, at the time of making their entries, file with the Chief of the Bureau a statement as to their pedigree, affirmed or sworn to before an officer authorized to take affidavits, and the papers so filed shall be furnished to the Jury of Experts. 22. The ages of live-stock must be calculated up to the opening day of the exhibition of the class to which they belong. 23. Sheep breeders desiring to exhibit wool, the produce of the flocks, will display not less than five fleeces. 24. All animals must be entered according to the prescribed rules as given in forms of entry, which forms will be furnished on application to the Chief of the Bureau of Agriculture.

BREEDING HORSES.—Mares entered as breeding animals must have had foals within one year of the show, or if in the foal, certificate must be furnished to that effect. All foals exhibited must be the offspring of the mare with which they are at foot. Awards will be made to respective breeds for:—Pure bred turf stallion, six years and over. Pure bred turf stallion, four years and under six years. Pure bred turf stallion, over two years and under four years. Pure bred turf mares, six years and over. Pure bred mares over two years and under six years. Awards will be made for:—Trotting stallions, six years and over. Trotting stallions, over four years and under six. Trotting stallions, over two years and under four. Pure bred draught stallion, six years and over. Pure bred draught stallion, over four years and under six years. Pure bred draught stallion, over two years and under four years. Pure bred draught mares, six years and over. Pure bred draught mares over two and under six years. Trotting brood mares, six years and over. Trotting fillies, over four years and under six. Trotting fillies, over two years and under four.

RUNNING AND TROTTING HORSES.—Shall be judged according to their record up to August 15th, 1876, due regard being had to present condition. Awards will be made for:—Running horses having made fastest record. Trotting stallions having trotted a mile within two-thirty. Mares and geldings having trotted a mile within two-twenty-five.

WALKING HORSES.—Fast walking horses, whether bred for agricultural purposes or the saddle, will compete in the ring for awards.

MATCHED TEAMS.—Awards will be made for:—Matched teams having trotted a mile in two-thirty-five. Matched Stallions for heavy draught, over sixteen hands high, and over fifteen hundred pounds weight each. Matched geldings for heavy draught, over sixteen hands high, and over fifteen hundred pounds weight each. Matched mares for heavy draught over fifteen hands high, and over fourteen hundred pounds weight each. Matched mules for heavy draught, fifteen and a half hands high, and over thirteen hundred pounds weight each.

BREEDING ASSES.—Awards will be made to respective breeds of pure bred jacks over six years; pure bred jacks over three years and under six; pure bred she-asses over six years; pure bred she-asses over three years and under six.

NEAT CATTLE.—No cow will be eligible for entry, unless accompanied with a certificate that, within fifteen months preceding the show, she had a living calf, if born dead, was born at its proper time. No heifer entered as in calf will be eligible for a prize, unless accompanied with a certificate that she has been bulled before the first of April, or presents unmistakable proof of the fact to the judges. No bull above one year old can be entered unless he have a ring in nose, and the attendant be provided with a leading stick, which must be used whenever the animal is taken out of the stall. Awards will be made for the best herd of each respective breed, consisting as follows: One bull, four cows, none under fifteen months; neat cattle, of each respective breed, will compete individually for awards. Bulls 3 years and over; bulls over 2 years and under 3 years; bulls over 1 year and under 2 years; cows 4 years and over; cows over 3 years and under 4 years; cows or heifers in calf, over 2 years and under 3 years; yearling heifers. A sweepstake award will be made for the best bull of any breed; a sweepstake award will be made for the best cow of any breed.

FAT AND DRAUGHT CATTLE.—Animals entered as fat and draught cattle need not be of pure blood, but will compete on individual merits. Fat cattle must be weighed, and in general those will be judged best which have the greatest weight with the least surface and offal. Awards will be made for:—Best fatted steer of any age or breed; most powerful yoke of oxen; most rapidly walking yoke of oxen; most thoroughly trained yoke of oxen; most thoroughly trained team of three or more yokes of oxen.

BREEDING SHEEP.—All sheep offered for exhibition must be accompanied with certificate to the effect that they have been shorn since the 1st of April, and the date given. If not fairly shorn, or if clipped so as to conceal defects, or with a view to improve the form or appearance, they will be excluded from competition. Awards will be made to respective breeds for the best pen of five animals of same flock and including one ram, the ewes all having had living lambs the past spring. Awards will be made to respective breeds for rams 2 years and over; shearing rams. A sweepstake award will be made for the best ram, respectfully of long, middle, and fine-wooled breeds. Awards will be made to respective breeds for ewes in pens of three, all having had living lambs; shearing in pens of three. A sweepstake award will be made for the best pen of three breeding ewes, respec-

tively of long, middle, and fine-wooled breeds.

Fat Sheep.—Fat sheep entered for competition must be weighed, and in general those will be judged best which have the greatest weight, with the least surface and offal. Awards will be made for pen of three best fatted sheep of any breed.

Breeding Swine.—Every competing sow above one year old must have a litter, or be in pigs, and the owner must bring proof of these facts, if required. If a litter of pigs be sent with a sow, the young pigs must be sucklings, the offspring of the sow, and must not exceed the age of three months. Awards will be made to respective breeds for the best pen of one boar and two breeding sows; for pen of sow and litter. Awards will be made to respective breeds for boars 2 years old and over; boars 1 year old and under 2 years; boars between 9 months and 1 year; breeding sows 2 years old and over; breeding sows 1 year old and under 2 years; den of three sow pigs between nine months and one year. A sweepstake award will be made for the best boar of any breed. A sweepstake award will be made for the best sow of any breed.

Fat Swine.—Fat swine entered for competition must be weighed, and in general those will be judged best which have the greatest weight, with the least surface and offal. First, second and third prizes will be awarded for pair of best fatted hogs of each breed; pair of best fatted hogs of any breed.

Dogs.—Awards will be made to respective breeds for dogs of two years and over; dogs of one year and under two; pups. A sweepstake award will be awarded for the best dog of any breed displayed by a foreign exhibitor. A sweepstake award will be awarded for the best home-bred dog of any breed. Awards will be made to respective breeds for bitches of two years and over; bitches of one year and under two; bitch pups. A sweepstake award will be awarded for the best bitch of any breed displayed by a foreign exhibitor. A sweepstake award will be awarded for the best home-bred bitch of any breed.

Poultry.—Poultry can only be exhibited in coops made after specifications furnished by the Bureau of Agriculture. Awards will be made to respective breeds for pairs of one year and over, of chickens, turkeys, geese, swans, pigeons, guineas and ornamental birds For pairs under one year.

Fish.—Living fishes will be displayed in both fresh and salt water aquaria. Awards will be made for largest display of fish of each species. Largest display of fish of all species.

A. T. Goshorn,
Director General.
Burnet Landreth,
Chief of Bureau of Agriculture.
Philadelphia, Nov. 10, 1875.

Camels.—Denison *News*, October 29: Our old Arizona friend, Bethel Coopwood, now residing at Austin, Texas, has made a business of raising camels in Texas for over ten years, and it has proved quite lucrative. When he travels over the State, which is quite frequently, he moves in a style becoming an oriental prince, with a train of camels, himself mounted on the most venerable specimen of his collection. A few days ago, as we see by the papers, he sold five out of his herd for $1,650—two year-olds at $250; three year-olds at $350 and five year-olds at $450. All these camels were foaled within twenty miles of Austin. The five year-old is the largest camel ever seen in America. Mr. Coopwood can supply all the circuses in America. We understand he proposes to rear ostriches and elephants, and is making preparations to receive Shetland ponies at his ranch.

Shipment of Short-Horns for San Francisco.—Says the North British Agriculturist: On October 20th there were shipped from Liverpool, by the steamship Erin, a number of highly-bred short-horns by Mr. R. B. Ashburner, their destination being San Francisco, where he has been resident for some years. Mr. Ashburner purchased at the recent sale of his brother, Mr. W. Ashburner, at Conishead Priory, and from the herds of his younger brother, Mr. George Ashburner, Low Hall, and Mr. Brogden, M. P., four bulls and seven females—which he accompained on the voyage. The animals are mostly of Bates' blood.

The Dairy.

Commencement and Progress of Associated Dairy Farming.

While this system of individual dairying was at its height there was, by chance, a convenient arrangement invented in Oneida county which in due time revolutionized the system of cheese manufacture, and has given the history of agriculture that method which is known as "the American system of associated dairying." As in the case of many an important innovation upon established customs, the inventor builded more wisely than he knew. Jesse Williams owned, in 1851, a private establishment for cheese-making near Rome, in Oneida county, New York. He had achieved a reputation as a manufacturer of the best quality of cheese. To him, as to many others, this reputation was a direct money value upon the market. He could make a contract for a better price than others, and the demand for his cheese was greater than the supply. In the Spring of 1851 one of Jesse Williams's sons was married and went to live upon a dairy farm near his father's. The cheese from this farm Mr. Williams contracted at the same price as his own, but there was a necessity that it should be of the same quality. This was the quandary—how can the cheese be alike when the father is a skilled manufacturer and the son is not? This was the question which Mr. Williams had to answer. It first occurred to him that he could go each day to his son's dairy-house and try to impart to his son his own skill in manipulation. But this involved a great deal of trouble; and Mr. Williams second thought was the principle of associated dairying which will make his name endure. It was a happy thought—happy in its exceeding simplicity and in its fitness for universal application, as events have proved. Mr. Williams could not go to the milk—the milk must be brought to him. The success which he attained in his venture was the keynote of the success which has been gained by the wide application of his method. Skill cannot act in many places at the same time, but skill is powerful over masses of material; one large establishment occasions less labor and expense than a dozen small ones, each doing one-twelfth of its work; all supplies are cheaper at wholesale. These are some of the advantages that have led to the wide adoption of the American factory system. They were not perceived at once. For three years Mr. Williams and those who brought milk to him profited by them. During the next five years only three or four establishments were erected each year. Since that time the growth has been rapid. In the year 1866 there were more than 1,000 factories in operation in New York State. The appreciation of the advantages of the factory system gave, at length, a marvelous impulse to the industry. Cheese-making, which was once monopolized by the rich counties of Central New York, is now a flourishing specialty in half-a-dozen regions of the State. It has pushed westward, shaping the productive ability of the Western Reserve, finding favoring conditions for growth in Illinois, Wisconsin, Michigan and Iowa, and gathering groups of dairies in almost every other Western State. It is just now spreading anew in Pennsylvania. To the eastward, Massachusetts and Vermont have given it heartiest welcome, and Maine, youngest of the dairy regions, promises to exert an influence upon the supply.

When the abolition of the reciprocity with Canada threw the Canadians upon their own resources, the development there was sudden and extended. In 1873 Canada manufactured 20,000,000 pounds of cheese by the American method, and is now our strongest rival in the English markets. The American factory system has gained an enduring foothold in England, where an American, Mr. Schermerhorn, of Oneida county, was employed by English dairymen to instruct them in its practice. It has been introduced upon the continent of Europe, and the latest tidings of its progress is that Russia has sent emissaries to borrow from England the associated idea which we implanted. The simple contrivance of the Oneida county farmer of 1851 has reproduced itself in at least five thousand establishments, calling to its uses an aggregate capital of at least twenty-five millions of dollars for working facilities alone, and placing each year upon the markets of the world a manufactured product worth one hundred and fifty millions of dollars. And the system is not yet twenty-five years old.—*Harper's Magazine for Nov.*

Poultry Yard.

Watering Poultry.

It is the belief of the writer that many of the diseases incident to poultry are due to neglect in providing them with pure water. Particularly do I believe such to be the case in the majority of instances where chicken cholera prevails. The omission to furnish fowls with suitable drinking water is one of the worst features of cruelty to animals. It is a neglect that is decidedly adverse to success, and hence tends to diminish individual fancy for fowls and works detriment to poultry interests. Those whom we occasionally hear say that "there is no profit in poultry" are not qualified to have the management of the same, and in their attentions may be classed with those thriftless and neglected parties who keep fowls that get drink when it rains.—*Fancier's Journal.*

Buckwheat for Poultry.—Buckwheat is one of the most staple articles of poultry food. It is very fattening, an excellent egg-producer and very much relished by the poultry. It is not, perhaps, used as extensively here as in Europe. In England, France, and especially in Germany, it forms not only an important part of poultry food, but is much used for various culinary purposes. The great advantage which it has over other cereals is, that it thrives luxuriantly even on the poorest land. Those who have not tested its value as poultry food we advise to give it a trial.

We must not, says the *Western Rural*, attach too great importance to non-essential and comparatively valueless peculiarities of poultry. Flesh of good quality, eggs of good size and plentiful in number, early maturity, good size, hardiness, good disposition—these are more important than the color of the feathers or legs, the size or shape of the comb or tail or the number of toes.

A breeder of poultry writes: "Every spring I procure a quantity of cedar boughs and scatter them plentifully in and around the hen-house. This is all that is necessary, as the odor of the cedar keeps away lice. This remedy is cheap, simple and effective, and is well worth trying by all who have hens to care for."

Hens' eggs hatch in from 19 to 21 days; turkeys' in from 26 to 29 days; ducks' in 28 days; Guinea fowls' in from 25 to 27 days; pea fowls' in from 28 to 30 days; geese' in from 30 to 32 days. Fresh eggs will hatch one or two days sooner than those two or three weeks old.

Hygienic.

Croup and How to Treat it.

BY "JEWELL."

Of all ailments children are liable to, perhaps none is more sudden, and requires more prompt attention on the part of parents and attendants, than croup. Certainly nothing sends such a thrill of terror to a mother's heart as that harsh, grating cough, like the barking of a dog, in the stillness of the night, especially if that mother has seen one of her beloved little ones lying cold and still, suffocated by her not knowing *how to do* in time, I find *we mothers must know* how to apply simple remedies in our families, or bear the consequences. Doctors are not always near by to be called in every time our little ones need care; and even if they were, it is an expensive luxury, to pay for putting the responsibility on someone else that rightfully belongs to us.

Croup is inflammation of the trachea, and in some cases the inflammation is so concentrated that the mucous or phlegm forms into a false membrane which is very tough, causing first a rattling sound, and producing strangulation if not relieved immediately. In the ordinary form of croup the cough is dry and hard, and is easily remedied by anything that will bring the inflammation to the surface. Put on an extra flannel shirt or waist over the nightgown and have a big flannel to wrap the throat in; then saturate a smaller piece of flannel in kerosene and lay over the throat and chest, wrap well outside with the large flannel, and in very many cases the child will sleep well the rest of the night. Follow this up for several nights—if the skin is much inflamed leave the kerosene off—and you will have no trouble with the croup. Always see that the *feet are warm* and try and not awaken the child, as it is always better for it to *rest and keep quiet* when there is any ailment of the respiratory organs—remember this. Some persons of delicate skins cannot bear kerosene. Goose-grease or sweet-oil, with red peper sprinkled over, is very good, or hot water with plenty of flannel to cover, is also good; also cold salt water. If the case is very severe, a hot bath, as warm as the child can bear it, is needed. Take the wash-boiler, and if the child is not too large or the boiler too full of water, it makes the best kind of bath-tub (off the stove, of course) immersing the child entirely, except the head; have more warm water to fill up with, and keep the child in till the skin is red or the patient weary and sleepy. Lay a folded sheet inside of a warm blanket and wrap the child in th s as it is lifted from its bath. In a few minutes commence wiping the body and limbs with a soft towel, exposing the skin to the air as little as necessary, and replace its night-clothes quickly. Then a thorough, warm wrapping after the nightclothes are on is necessary to produce sweating. Apply cold salt cloths to the throat and chest as frequently as may seem necessary. In all cases the mother must use her *head* more than her *heart*, remembering that she has the power to ease the little one equal to the most skilled doctor, provided she be thorough. In some cases a gentle emetic, as Hive Syrup, is given, to throw up any phlegm and produce perspiration, but it is not usually necessary. The following day let the child be better wrapped than usual and have the diet simple and see that the bowels are free. Use an injection of tepid water if they do not move without.

This treatment is better than any medicine, and no child need die with the croup if taken in time and properly treated.

MAKE THEM COMFORTABLE.—"Mary, why do you continue to put up your shoulder in that awkward manner?" said Mrs. Lane sharply to her little girl. "I have reminded you of it half-a-dozen times at least this very day, and still you pay no attention to it. Now remember, if you have to be spoken to again about it this afternoon, I shall keep you at home from Aunt Lucy's to-morrow."

The child's face flushed, and as she looked down, her eyes half filled with tears. She seemed timid and anxious lest she should commit the fault again, yet it was almost a certainty that she would.

"Come here, Mary dear," said Aunt Lucy very gently, but with quite an indignant flush on her cheek. She began to unbutton the little dress and examine the make of the underwaist.

"Just as I expected, Sister," she said impulsively. "Here is this shoulder-piece not fitting at all, but every moment slipping down over the point of the shoulder in an aggravating way. What comfort would you take with a garment acting in that way? Poor little shoulder," she said, as she rubbed it gently with her soft, white hand. "Now Auntie will take a stitch or two here for the present, and will fix it better when you take it off. Don't that feel better? Now run and play, and after a while you'll get all out of the fashion of putting up one shoulder."

The little girl kissed her aunt gratefully, as she tripped away, much happier than she was a few minutes before.

"You should be ashamed of yourself, Sister," said the young lady energetically, when the child had gone, "to leave a child in such discomfort and then blame her for acting awkwardly. I have seen a mother scold her child for limping when she had on a shoe much too tight, or one with a nail in the heel that hurt her at every step. There is plenty of unavoidable suffering in this world without adding any needless pain to the burden. It is as little as we can do to make children comfortable when we expect them to be good and behave with propriety. Full two-thirds of the bad behavior of our children lies at the parents' door."

The remarks of her spirited young sister set Mrs. Lane a thinking more seriously than she has ever done before, on the duties of parents to make their children comfortable, and it is to be hoped the good results were seen in her after treatment of her little ones.—*Mother's Magazine.*

SALT WATER FOR THE EYES.—Many persons are suffering pain from weakness of the eyes. This, sometimes, proceeds from local inflammation, sometimes from other causes. Several persons who have thus been afflicted inform us that they derive almost immediate, and in some cases, permanent relief from the application of salt water as a bath; and when the pain has been aggravated, from a compress saturated with salt water laid on the eyes, and renewed at frequent intervals. Opening the eyes and submerging them in clean salt water has been found beneficial to those whose eyesight begins to fail.

TOBACCO.—Softening of the brain is a disease always connected with the use of nervines in some shape. Tobacco is a powerful agent in its production. Trembling is one of the usual symptoms of acute, and a common result of chronic nicotism. The Minister of Public Instruction in France issued a circular to the directors of colleges and schools, forbidding tobacco to students, as injurious to physical and intellectual development. Tobacco and insanity are closely connected. It is stated upon the best authority that of those who become insane from the supposed use of spirituous liquors, eighty-seven per cent. also use tobacco.

FARMERS AND RHEUMATISM.—Why are farmers so liable to rheumatism? Because they wear wet clothing, heat and suddenly chill the body, over eat after very hard work, and because they do not keep the skin in a vigorous, clean and healthy condition. If farmers would avoid suddenly cooling the body after great exertion, if they would be careful not to go with wet clothing and wet feet, and if they would not over eat when in an exhausted condition, and bathe daily, using much friction, they would have less rheumatism. The same rule applies to other than farmers. The Turkish bath is the best remedy for rheumatism. —*Science of Health.*

PLENTY OF SLEEP.—A medical man discoursing upon sleep, makes this remark: "One man may do with a little less sleep than another; but as a general rule, if you want a clerk, a lieutenant, a lawyer, a physicain, a legislator, a judge, a president or a pastor, do not trust your interest to any man who does not take on the average eight good solid hours of sleep out of the twenty-four. Whatever may be his reason for it, if he does not give himself that, he will snap sometime just when you want him to be strong."

BATHING AND EXERCISE GOOD FOR THE EYES. —William Cullen Bryant has the best eyesight of any man of his years in this city. It is well known that he bathes daily, and goes thorough sundry gymnastics with an invariable regularity, which ensures a remarkably good health. Is there no connection between those habits and the rare strength of his vision?—*N. Y. Letter.*

If any one considers what "farming is" or what it ought to be, they would come to the conclusion that farming ought to be the managing of land so as to keep it in condition to pay for occupation, and there will be many farms which will pay for occupation which will not pay for cultivation; that is, there are vast tracts of country which, from the nature of the soil, from the high price of labor and from its adaptability to remain in permanent actual grass, would pay exceedingly well to grsze with any kind of live-stock and by raising stock, dairying, fattening, and wool growing, etc., money could be made fast—this would be farming, and any system of cultivation and course of cropping on good, free working land, which would keep the land rich in plant food and allow of selling enough to cover expenses and pay interest on capital and also profit to occuppier, would be farming, and good farming too. Therefore it is easy to say what farming is; but robbing the land is not farming—it is running down of God's beautiful earth! And although many can purchase a fine tract of land and accumulate a fortune from the fine crops the new virgin soil produces, if they take crop after crop without some system of reimbursing it for the drain upon its productive powers, they are no farmers in a strict sense of the word, but real despoilers of their country's wealth and are deserving of repobation.

MR. WATTS lays much stress upon his efforts to introduce the ramie and jute plants into the Southern States and California. The public will agree with him that if their production proves as profitable as he anticipates, he has conferred a lasting benefit upon the nation. But the problems of their culture and manufacture have not yet been solved.

Porcine.

Pat and the Pig.

We have read of a Pat so financially flat
That he had neither money nor meat,
And when hungry and thin, it was whisp-
pered by sin
That he ought to steal something to eat.

So he went to the sty of a widow near by,
And he gazed on the tenant—poor soul!
"Arrah now," said he, "what a trate that'll be,"
And the pig of the widow he stole.

In a feast he joined; then he went to the judge;
For, in spite of the pork and the lard,
There was something within that was sharp as a
pin,
For his conscience was pricking him hard,

And he said with a tear, "Will your reverence
hear
What I have in sorrow to say?"
Then the story he told, and the tale did unfold
Of the pig he had taken away.

And the judge to him said, "Ere you go to bed,
You must pay for the pig you have taken;
For 'tis thus, by my soul, you'll be saving your
soul,
And will also be saving your bacon."

"Oh, be jabers," said Pat, "I can niver do that—
Not the ghost of a hap'orth have I—
And I'm wretched indade if a penny it made
Any pace for my conscience to buy."

Then in sorrow he cried, and the judge replied
"Only think how you'll tremble with fear
When the Judge you shall meet at the great judg-
ment seat
And the widow you plundered while here."

"Will the widow be there?" whispered Pat, with a
stare,
"And the pig? by me sowl, is it thrue?"
"They will surely be there," said the judge, "I
declare;
And, oh Paddy! what then will you do!"

"Many thanks," answered Pat, "for your tellin' me
that;
May the blessings upon you be big!
On that settlement day to the widow I'll say;
'Mrs. Finnegan, here is your pig!'"

The Berkshire Hog.

At a late State Fair in the East there was not one white hog exhibited. All were black, and either Berkshire or Essex. At the largest of the Western State Fairs, that of Illinois, nearly all the hogs were black, or black and white. This would seem to indicate the rapid growth of the black breeds in public favor, and of these the Berkshire takes the lead. As well indirectly as directly, for in the Poland Chinas of the West is seen, in the majority of cases, the Berkshire blood greatly predominating. The Berkshire has been most carefully bred for many years, starting from what was originally a large breed, possessing many good points, and of a black and white and yellowish spotted color. The improvement of the old Berkshire hog was begun in England by Lord Barrington, who died in 1829, and most of the best herds now trace back to this original improved herd. By careful breeding the yellowish color has been gotten rid of, and the white has been confined to the feet, a spot between the eyes, and in some cases a few white hairs near the shoulders, although there are herds in which these last white marks are entirely bred out. The Berkshire, as we now know him, is a moderately large hog, with a smooth, round carcass, broad across the shoulders, with well developed and round hams, a long, deep flitch, very fine, small, bony legs and feet, short face and snout, and covered with a good coat of long, silky, black hair. In many good Berkshires the bluish or slate-colored tint and thin hair of the Neapolitan hog, which has been crossed upon it, is very conspicuous, but it is a question if the black, well-haired animal is not the more vigorous and thrifty sort. One of the chief characteristics of the Berkshire is the evenness with which it breeds. At the exhibitions and in the breeders' yard whole litters may be seen that scarcely vary from each other, and hardly to be distinguished one from another in appearance, and pen after pen may be examined without any marked variation, excepting in those cases in which, as already noted, the Neapolitan cross is apparent. After fifty years of careful breeding, this is not more than might be expected, and the result appears in an animal which, on the whole, is probably the most profitable to the breeder, the feeder, the butcher, and the packer. There is no pig that is more useful to the man who keeps but one, and more to the farmer who feeds a hundred, if the amount of meat in proportion to feed consumed be considered. There is more lean in proportion to fat than in most other, if not in all other breeds, and the bone and offal are very light. The black color is not only skin deep, but the color lies in the outer skin, which is all removed by scalding, and a Berkshire ham is not to be distinguished from that of a white hog if the hair has not been left on to tell the story. It is no little evidence of its good qualities that the Berkshire has become so rapidly popular, in spite of the prejudice against its color, as to supplant, along with the Essex, all the white breeds at one of the most prominent Eastern States Fairs.—*Home Journal.*

Breeding Swine.

The present rage among American pig breeders to possess animals of pure blood, whether in the Berkshire, Essex, Suffolk, or any other breed, while likely to prove ultimately of general benefit to the stock of swine in the country, is far from being the end to which breeders should aim at. As a general thing, very few pigs are really thoroughbred, and now in England, from a well-known tendency of the hog to degenerate and become enfeebled in constitution, the moment the refining process through in-and-in breeding is carried beyond a limited point, it will be well for breeders to consider if it is not more to their advantage rather to breed for feeding purposes, than to aim at getting fancy prices for fancy animals of a certain fixed type. It has been proved time and again in Britain that the cross-bred pig is the one for profit in the pen. What is wanted is to have good blood in the males, with sufficient of bone and smallness of offal, to ensure early maturity and quick feeding. Cross these males on sows of a larger and coarser frame, with sound healthy constitution, and we obtain a pig that is a good way ahead of the common sort. By keeping to the use of well bred males, selected with a view to possessing the points that go to make up a fine pig, without regard to color or fancy points in markings, we get healthy thrifty pigs that will readily attain fair weight at an early age, on a moderate amount of feeding.

Experience in pig breeding teaches that it is better to use small but thoroughly well-formed boars that are quick, easy feeders of their breed, rather than larger ones, and never to use the same boar more than one year. The boar in all cases should be smaller and finer than the sows to which he is put. —*English Paper.*

What Constitutes a Good Pig.

The *American Swine and Poultry Journal* says: We would not speak of any particular breed, but would generalize; as what can be said of a good pig of one breed holds equally good of one from another breed, if we except the size, shape, position of ears, tail, etc., and marking. A good pig is one that has the smallest proportionable amount of offal; whose nose, feet and tail are shortest, generally speaking, and smallest, consistent with proper locomotion, etc. A good pig is one that has heavy, broad hams, good deep chest, showing a healthy constitution; which has a quiet disposition, yet one which is always ready to get a square meal, and which can digest and assimilate all it eats in the quickest possible space of time without impairing the digestive organs. We do not want a pig which has a small appetite, but one that eats all that is given it with an evident appetite. The profit consists in getting your grain and other food rapidly converted into pork; the quicker the better. Never bother much with a restless pig, for a quiet one, with the same chances in his favor which the restless one has, will soon outstrip him in the race for fat and pork.

Grapes Make Pork.

Says the *Foothill Tidings:* In a recent conversation with our old friend Thomas Payne, whose fine farm and vineyard is situated on the Colfax road two miles from town, we learned that he had been trying the experiment of feeding grapes to hogs. He says he finds the practice all and more than has been claimed for it—that the pigs eat the grapes with avidity and are taking on flesh rapidly. There is no excuse for the miserable shiftlessless of the farmers of the foothills of California which compells the importation of pork and lard from Illinois and Iowa. With rye and grapes, two crops that can be easily raised here, and with never a failure, we can produce pork here at a less cost of labor than can be done there, and save all the freights and profits while the money is kept at home.

Short Hog Crop.

It has been a long time since we have had so short a hog crop in the West, says the *Rural World.* Several causes have contributed to it. The severe drouth of last year and the year before, and the chinch bug and grasshopper invasions, made corn scarce and high, and but few hogs were kept over Winter. The high price for pork last year caused every available hog to be fattened and slaughtered. Then there has been a great mortality in hogs, caused by what is known as hog cholera. All of these matters have decreased the number of hogs, and good prices can be commanded if the farmers will stand firm and not be in too much haste to slaughter.

"My onthankful hearers," said a backwoods preacher, "you air like onto hogs eatin' acorns. They never look up to see where the acorns come from."

New Peat Fuel Company.—Articles incorporating the Santa Clara Valley Peat Fuel Company have been filed in the office of the County Clerk. The capital stock is placed at $1,500,000, divided into shares of $100 each. The Company will have its principal place of business in this city, and its term of existence is fifty years. A certified copy of the articles of incorporation has been transmitted to the Secretary of State. The Directors are all of this city, and are as follows: Samuel A. Bishop, J. H. L. Tuck, Cuthbert Burrel, J. H. Elwood, and Edward McGowan.

How to Stop a Newspaper.—Do not leave it to your friend who is going to town. Do not leave it to the Postmaster, unless you know he is a prompt, reliable man; but send a notice by letter or postal card to the publisher, *giving the address to which the paper is sent,* and your order will receive prompt attention.

A farmer from Lake Washington informs the Seattle *Tribune* of the 19th that he had raised onions on his place this season at the rate of 1,450 bushels to the acre. Nine and ten hundred bushels are claimed every year for various parts of the Territory.

Since the rain the atmosphere is pure and balmy and men's minds are clearer. One man who had owed us for four years, came in and said he would pay us as soon as the next crop of wheat comes off, showing the beneficial effects of a gentle shower on the mind.—*Pajaronian.*

Pisciculture.

FISH.

And What the Fish Commissioners Have Done to Stock our Waters.

FROM the 36-page pamphlet which forms the biennial report of the California Fishery Commission, we glean the following information of great consequence to ichthyophagists:

In 1874 the Commissioners telegraphod to Livingston Stone to prepare another aquarium car to take the place of the one destroyed by the breaking of a railroad bridge over the Elkhorn river in Nebraska. He was also instructed with reference to the varieties of fish to be brought across the continent. He arrived June 12, 1874, having succeeded in transporting safely seventy-three full-grown spawning black bass from Lake Champlain, which were placed in Napa Creek; twelve small black bass from St. Joseph's river, Michigan, which were placed in Napa and Alameda creeks; sixteen full-grown glass-eyed perch from Messisquoi river, Vermont, which were placed in the Sacramento river; seventy-four catfish, which were placed in the San Joaquin river, near Stockton; seventy horn pouts, from Lake Champlain, which were deposited in lakes at Sutterville, Sacramento county; three hundred small Eastern salmon, obtained from the Penobscot river, Maine, were placed in the Sacramento river, near Reading; four full-grown rock-bass from the Missisquoi river, which were deposited in Napa Creek. Of salt-water fish there arrived twenty-three tautogs, or black fish, which were deposited in the Bay of San Francisco. Of the one hundred and fifty full-grown lobsters, with which Mr. Stone started, only three lived through the journey. The details of Mr. Stone's experiments in gathering and transporting these different varieties of fish are appended to the report, and form a valuable contribution to the new science of fish culture.

THE IMPORTATIONS.

Of the new varieties of fish thus introduced into the waters of California, the Commissioners are convinced that the greater number have found congenial homes and have spawned. During the present season black bass have been caught in Napa Creek, and large numbers of the young have been seen. The catfish placed in the San Joaquin river have grown rapidly and spawned. The hornpouts, a species of small catfish, which were placed in the lakes near Sacramento, have increased so abundantly that nearly one thousand have been caught. None of the Eastern salmon have been seen since they were placed in the Sacramento river. Without doubt they have gone to the ocean, not to return till the Spring of 1876. The report maintains that this experiment in the importation of new varieties of fish is so great a success that the people of the State are already amply repaid for the small amount expended in the undertaking.

WHITE FISH.

From the Eastern States the Commissioners received twenty thousand white fish eggs from Lake Champlain, and besides they purchased in New Hampshire sixty thousand eggs of the Eastern brook trout. The twenty-five thousand white fish eggs received from the Government in 1873 were successfully hatched and placed in that body of water. Inasmuch as Clear Lake seemed to be well stocked with these fish, the Commissioners thought it advisable to place the last donation in Tulare Lake. The Regents of the University permitted the erection of a small hatching house on the banks of the stream at Berkeley, where, under the supervision of J. G. Woodbury, these eggs were successfully hatched.

SALMON.

The largest establishment in the world for the hatching of salmon eggs is that belonging to the United States, on the McCloud river, in Shasta county, under the superintendence of Livingston Stone. At this point from six to ten million of young salmon are hatched each year and distributed to the Fish Commissioners of the various States having rivers suitable for their growth and increase. In 1873 California received from that source half a million fish, which were turned into the Sacramento river. The Government works at this point are so extensive, and conducted with such economy, that it is found that the total cost of hatching one thousand fish from the egg is but one dollar. On this subject the report says: We have thought it to be of so much public importance to increase this valuable variety of fish in its native waters, that during the past year we considered it advisable to expend $1,000 in the hatching of one million more fish, to be placed in the Sacramento river. We therefore applied $1,000 of our appropriation to this purpose, and the fish have been successfully turned loose. Our appropriation being about exhausted, we will this year pay for the hatching of but a half a million more fish.

SEA LIONS AND SEALS.

For many years the sea lions and seals which inhabit the cliffs near the entrance to the Bay of San Francisco, have been preserved by special enactment, and penalties imposed on any person who should kill or disturb them. The result is, that they are probably now a hundred times as numerous as they were ten years since, and are to be found there in thousands. When it is considered that they weigh from two to five hundred pounds each, and that they each consume at least from ten to twenty pounds of fish daily, it will be readily seen that the quantity caught at the entrance of the harbor and in the Bay of San Francisco by fishermen, is small in proportion to that consumed by these animals. If allowed to increase at the same rate for a few more years, it will be difficult for either shad or salmon to escape them while entering our bay. The fishermen at Vallejo and Rio Vista report that they find many of the salmon to have been torn by the teeth of these animals. They appear now to have no useful purpose other than to gratify the curiosity of strangers, and we believe it would be well if the law which now protects them was repealed and nine-tenths of them allowed to be shot, that their oil might be utilized in the lubrication of machinery. We would recommend that this law be repealed, and, if necessary, again re-enacted after nine-tenths of them had been destroyed.

THE STATE APPROPRIATION.

The Commissioners believe that if the Legislature, instead of giving them a mere pittance of $2,500 a year, were to make an appropriation of $6,000 or $10,000 a year, so many salmon could be hatched and deposited in the Sacramento and San Joaquin rivers that after three years the fish would be so numerous that they would compel the erection of extensive canning establishments on those rivers, as there are now on the Columbia. In conclusion the Commissioners say: The observations we have made upon the food fish of our rivers, and the statistics we have gathered from various sources for the information of those who are interested in the science of fish culture, have involved a large amount of labor, which, on the part of your Commissioners, has been altogether gratuitous. A liberal appropriation by the Legislature will enable us to extend our operations and carry out to completion the objects for which this Commission was created. We feel that the work we are engaged in, and in the promotion of which we are willing to devote our time and labor in the future, is deserving of a more liberal support from the State than it has hitherto received.

CALIFORNIA PISCICULTURE.—Early in the Summer of 1873 Mr. Livingston Stone, the eminent fish-culturist, established his first salmon-breeding camp on the McCloud river, away in the north of California. The picturesque river so swamed with salmon that from his tent-door he could see them jumping "at the rate of a thousand an hour!" His intention was to erect a hatching-house and then forward the eggs to the Northern, Middle and Eastern States. At first the Indians were troublesome and showed their dislike of the intention in several unpleasant ways; but finding that they lost nothing and gained much by the establishment, they in time became Mr. Stone's most valuable assistants. The upshot of his venture was that on the 26th of August, 1873, he took from the captured fish twenty-three thousand eggs: and by the 22d of September he had secured more than two millions. Of this number, we learn from the last or seventh annual report of the operations of the Commissioners of Fisheries for 1874, over a million and a quarter reached New York, New Jersey, Pennsylvania, Michigan, New Hampshire, Connecticut, Maine and Utah alive. The consignees were the Fish Commissioners of those States, to the rivers of which they were in due time transferred. The mode of packing the spawn was to place them in moss contained in boxes two feet square by a foot in depth, the covers were firmly screwed down, and so they were sent off on their perilous journey of three thousand miles.

In addition to the Commissioners of Fisheries, there has been established in New York a very important body entitled the "American Fish Culturists' Association." The object of the Association is, by the transportation of ova, to advance the fish interests of the various States. *To* California this has meant the gain to her waters of the shad (which stand at the head of the herring family) and the lobster; whilst *from* California nearly all the other States of the Union have been supplied with a market dainty at a reasonable price, the salmon, to wit: From our teeming rivers the waters of the other States have been stocked with the ova of this splendid fish, and now there is not a city on the Atlantic board but has its season of fresh California salmon.

FISH FOR THE CENTENNIAL.—Since the appropriation by Sweden of $100,000 for the sole purpose of exhibiting the fish of its waters at the Centennial, the zeal of the United States Commissioners in that direction, in the interest of their own country, has greatly increased. Professor Bayard, of the Smithsonian Institute, is at present engaged at Wood's Hole, Mass., in making an exact counterpart in plaster of Paris of every species of fish that swims contiguous to the United States. A mould of the fish is first taken, afterward the copy is painted directly from the originals. Mr. Eugene Blackford has at present at Fulton Market three specimens of this work, which were sent him as a compliment by Prof. Baird, who has received from Mr. Blackford 300 different species of fish for the advancement of science, at the Institute which he represents.—*American Grocer.*

A BUSINESS man's advertisement, in his own language, over his own signature, and for which he is plainly responsible, is in the nature of an official document, and receives more considerate attention than a puff in the local column, and is both more valuable and respectable. There is an air about the responsible advertisement which says: "I want to trade, and will give you a fair bargain." The puff insinuates that there is no responsibility in the matter.

A TRUE journalist aspires to uplift his neighbors, to encourage the pursuit of good and to check all that inclines in an opposite direction; and the natural disposition to evil is so strongly developed in man, that ordinarily he finds himself engaged in hostilities in which there is but little lull.

Educational.

Self Made.

HIS star of fate, to common eyes,
Seemed very small and dim;
And few the angel visitants
That sung the natal hymn!
But in that little feeble frame
Was lit a fire divine;
Destined to burn its bright way out,
To all the world a sign!

"Self-made!" No land to build upon,
Except the rock of trust!
No helpers, save one's own brave hands
And will, that cry "We must!"
Proud energy in every limb,
And in truth every glance
Of eyes that straightway seek your own,
As warriors throw the lance!

Nature (dear mother) waxes kind
To children all her own;
And often gives them wealth of blood
Add wondrous nerve and bone!
No pampering dries their sinews up,
No selfish, needless care
Relaxes muscles that are made
Life's burdens well to bear!

"Self-made!" The world has need of such
To plow her mighty seas!
To drive her commerce and her trade,
And catch each prosp'ring breeze!
As years gone by such noble souls
Have worked, nor worked in vain,
That "knowledge might run to and fro
The earth," an endless chain!

Do Agricultural Colleges Make Farmers?

It has often been asserted by those who are opposed to Agricultural Colleges, and especially those who object to having any State money expended in this direction, that the colleges do not turn out farmers—that a college course tends rather to turn the graduate from, than towards the farm, when his studies are finished.

In his address before the Legislature, President Abbot, of the Michigan Agricultural College, alluding to this oft-repeated assertion, makes the following statement regarding the policy pursued at the institution and the results attained thus far:

"It has been the design, says the President, of those who manage the Agricultural College, to create a bias towards, and not away from the farm; to make the whole atmosphere of the place one of respect for all kinds of work, and a feeling of fellowship toward farmers. To this end manual labor is insisted on from all, if we can speak of insisting on what students offer in excess of our requirements. To this end there is no furnishing of easier or more tasteful work to the seniors than is given to other students; the habit of work and taste for it is kept up to the end. To this same end the labor system and the instruction are planned to match each other, to illustrate each other, so that to the labor is given to some of the dignity of scientific work, and to the scientific instruction labor serves as a kind of laboratory practice for instruction.

The result of these efforts to create a truly agricultural school, appears in the fact that in place of 1½ per cent. of graduates going to farming, as from other colleges, 38 per cent., or, not counting those not living and those who are still students, 42 per cent. have gone to farming, fruit raising, and the nursery business as their chief or only business. In this respect the college is doing what has never been done before—sending men with good education in fair proportion back to work farms.—*New England Farmer.*

Agricultural Colleges in France.

Considerable attention has been drawn of late to the various agricultural colleges in this country, and the comparatively small percentage of pupils in them who devote themselves after graduation to agricultural pursuits. The utility of institutions which do not really foster the industry in whose behalf they are established has been questioned, with some reason, and a discussion has arisen in consequence which is likely to bring out the defects in the institutions we have, and possibly make them generally useful. As bearing upon this subject, certain statistics have been published relating to the agricultural colleges or "farm-schools" of France, with a view to showing that the difficulty complained of is not confined to this country. There are in France 33 farm-schools, with 862 pupils and 9,317 graduates. Of these graduates 2,992 have become farmers, owners and cultivators, or renters of farms; 845 have become gardeners, market gardeners or florists; 46 have become drainers, irrigators or makers of drain-tiles; 841 farm laborers, cow-herds or pig-feeders; 5 land-surveyors; 16 foresters and game-preservers; 29 agricultural accountants; 39 merchants in grain, wine or fertilizers; 38 farm directors; 15 veterinary surgeons; 19 students in agricultural colleges, and 104 belong to other employments connected with agriculture. From these figures it appears that about 44 per cent. of the pupils engage in what may fairly be termed agricultural pursuits. Although this proportion may seem much smaller than desirable, there is only one college in this country, that in Michigan, which makes an equally favorable exhibit.—*Ex.*

Influence of Newspapers.

The *Boston Traveler* states that a school teacher who had the benefit of a long practice of his profession, and had watched closely the influence of a newspaper upon the minds of a family of children, gives as a result of his observation that, without exception, those scholars of both sexes and all ages who have access to newspapers at home, when compared with those who have not, are:

1st. Better readers, excelling in pronunciation, and consequently read more understandingly.

2d. They are better spellers and define with ease and accuracy.

3d. They obtain a partial knowledge of geography in almost half the time it requires others, as the newspaper has made them familiar with the location of important places and nations, their governments and their doings.

4th. They are better grammarians, for having become familiar with every variety of style in the newspaper, from commonplace advertisements to the finished and classical oration of the statesman, they more readily comprehend the meaning of the text, and consequently annalize the construction with accuracy.

The Horse.

Horse Racing at Our Fairs.

VERY conclusively the present year has shown the effect which horse-racing and pool-selling has had upon all our County and District Fairs, and upon our State Fair also. Whoever has attended these fairs and witnessed the scenes enacted at these places—the gambling tables in full blast unchecked, the large amount of drunkenness and blasphemy witnessed, the disputes and quarrels seen, all the very outgrowth of the race-track, must see and be convinced that the time has come when a change must be made at our fairs—either the horse-race must be abandoned or our Agricultural Fairs must be given up wholly, this is certain. The general dissatisfaction expressed this year shows that the people are in earnest for a change in the management of fairs, beginning with the State Fair, and thus revolutionizing the plan of all our fairs. The fairs that have been held this year have been complete failures, and so far from any benefit or improvement to our farmers and their children, they have been the source of disgrace to every place where fairs have been held. We shall here except from the list of fairs thus far held this year, the Santa Clara Valley Fair, held at San Jose,—*Cal. Farmer.*

Now, if we wish to breed for a profit, we must breed what the demand calls for. There is a certain demand for heavy horses, but it is not among the high priced men of the present day. They want symmetry, style, beauty in appearance, and a good stepper. Such horses are always in good demand at good prices; and by breeding to perfect all points we produce muscle and endurance, and horses thus bred will endure greater hardships. They are medium hight, will draw all the load necessary for any farm team to draw, and when we hitch to our road wagons they will glide along with that loftiness of spirit which nothing but a well bred horse will show, and it is generally conceded by our best breeders that the medium size, well bred, is the better horse for all purposes. A horse that will weigh from eleven to twelve hundred pounds, fully developed, of good breeding, is of sufficient weight, and is worth buying, and is also worth keeping.—*Farmers Union.*

BRIDLE-BREAKING.—To cure a horse of bridle-breaking, get a piece of bed-cord, four times the length of the horse, and double it in the middle, and at the double end make a loop, through which pass the animal's tail. Then cross the cord over his back, and pass both ends through the halter-ring under his chin and tie both ends of the cord to the trough-ring through which the halter-strap plays, the end of the halter being attached to a billet of wood. Should the horse attempt to pull back, the strain will all be on the root of his tail before the halter-strap will become tightened, and he will at once step forward to avoid it. After so fixing him a few times in the stable he will abandon any such propensity.—*Canada Farmer.*

KEEPING HORSES' FEET AND LEGS IN ORDER. If I were asked to account for my horses' legs and feet being in better order than those of my neighbor's, I should attribute it to the four following circumstances: First, they are all shod with few nails, so placed in the shoe as to permit the foot to expand every time they move; second, that they all live in boxes instead of stalls, and can move whenever they please; third, that they have two hours' daily walking exercise when they are not at work; and fourth, that I have not a head-stall or trace-chain in my stall. These four circumstances comprehend the whole mystery of keeping horses' legs fine, and their feet in sound working condition up to a good old age.—*Miles.*

GLANDERS.—Following is the ordinance in existence with reference to glanders in horses in San Francisco: Section 14—Any person who shall keep or have in his possession, within this city and county, any horse afflicted with the disease known as the glanders, shall, within twenty-four hours after having knowledge or being notified thereof by any person, kill and bury the same, or remove it without the limits of the city and county. Any person who shall violate any of the provisions of this section shall be deemed guilty of a misdemeanor; and upon conviction thereof shall be punished by a fine of not less than fifty not more than five hundred dollars, or by imprisonment in the County Jail not less than twenty-five days nor more than six months, or by both fine and imprisonment.

MANY horses are ruined by harsh treatment when they are colts. Their dispositions are soured, and they come to look on man as a demon and an enemy. Teach the colt by every act that you are his friend. Be kind to him always, and you will gain his confidence to that degree that he will always obey the word when he understands your meaning.

Sheep and Goats.

The Angora Goat Business East.

THE following which must prove of interest to all wishing information on this subject, we clip from the *Prairie Farmer:*

A correspondent residing in Wayne County, in this State, recently enquired for a house in Chicago or elsewhese, that deals in the fleece of the Angora goat; about how much per pound the product is worth; if the goats can be made to pay in Illinois, and if they can be prevented from climbing fences and barking fruit trees.

We sent his questions to Col. Robt. W. Scott of Frankfort, Ky., for answer believing that he knew more about those animals and their future than any one we know of. Mr. Scott kindly replied as follows:

I reply, with pleasure, to your favor of the 29th ult. and as fully as permitted by infirm health, and by being on the eve of departure to my winter home, near Fort Reid P. O. Orange Co., Florida, from which if desired, I will reply more especially to your correspondent.

During the last fifteen years, I have built up a flock of several hundred Cashmere (or more properly Angora) goats; all of which are now either pure bred, or full blood. For about ten years the mohair, or wool of them, has been sold for me on commission, by Messrs, Bauendahl & Co., extensive wool merchants, of 86 Worth street, New York. It has met with ready sale at prices varying from seventy-five cents to one dollar and a quarter per pound, as shorn; and for the last two years has been sold by them at ninety, and ninety-two and a half cents per pound, the price fluctuating some, as with other commodities, and according to quality and condition.

I have also sold some to A. P. Bachman, manufacturer of superior plush goods, at 18 Franklin St., New York.

I have also had application for the sale of it by Messrs. Justice, Bateman & Co., enterprising and reliable wool merchants, of South Front street, Philadelphia, Pa. Besides other parties, I have had also extensive correspondence with the "Jamestown Alpaca Mills," at Jamestown, New York, and in one of their letters they informed me, two years since, that they had brought from England, extensive capital, skilled laborers, and appropriate machinery, and had located on an extensive tract of land, and were prepared to manufacture three hundred thousand pounds of mohair or Angora wool, annually, if they could obtain suitable material. I received a letter from this Company last spring, desiring to purchase my mohair, but it had been sent to my usual merchant.

I have been reliably informed that there is a factory which uses mohair in Providence, R. I., and one also in Worcester, Mass., but I have not been able to correspond with them. It is certain that there is now unlimited demand in the United States, and that there will be in all time to come, for all of the mohair of good quality which we can produce, and at prices which will pay the producer better than sheep's wool of any kind will. Its superior lustre, elasticity, durability and capacity to take color, make it the most desirable material for the manufacture of coverings for car seats, and this use alone will sustain an unlimited demand.

To command the best price, it should be free from *kemp* (the coarse *hairs* which the goat wears in summer, when the *mohair* has been shed), burrs and trash, and each fleece should be tied up seperately with a small colored thread.

The *kemp*, or coarse *hair*, is found also in the fleeces of low grade animals, and it reduces the price in proportion to the quantity; but mohair containing it will always sell at least at the prices of coarse sheep's wool, it being better adopted to the same uses as coarse wool.

Your correspondent asks, "Can they be prevented from climbing fences and barking apple trees?" and I reply that these capacities and tastes make them especially valuable, and they must be controlled and not destroyed, where they cannot be indulged. But clogging or coupling will prevent them from climbing, and a wire muzzle will prevent them from barking trees, &c.

But there is also another and more practical means of preventing both of these, viz.: by having good fences. A fence of common rails, seven or eight rails high, and staked and double ridered, with corners all erect and not leaning, and with the rails all of equal length, will hold them securely, and so will a post and rail, or a plank fence, five feet high, if the fences are in good order. Goats do not *break* fences of any kind, but only take advantage of the negligence of the farmer, where other animals have broken them. They will eat, and in course of time, will destroy a hedge of cedar, or of Osage orange, if they have access to it at all times. A stone fence may be made goat proof by placing pieces of scantling or plank, about two feet long, across the top of the wall and then nailing to them strips of plank on each side of the top of the wall, which strips will strike the goat in the face when he attempts to run over the wall. I have hedges and fences of all these kinds, and my goats are kept in several flocks, and, at some time of the year, in all of the different fields and pastures of a large farm, and they are useful in consuming the wild bushes and briars, the cutting of which by hand would require more time than any extra trouble to keep the fences in good repair at all times.

Though a goat does not produce so heavy a fleece as some sheep do, yet because goats consume a great variety of courser feed than sheep do, goats will produce as much or more wool than sheep will from the same quantity of ground, and the goat's fleece will sell at nearly double the price per pound of the sheep's fleece, and the same may be said of the flesh and skins of the two animals.

From these data your correspondent may judge of the propriety of raising the wool-bearing goat in Illinois, though the more appropriate locality may be in the prairies of Texas and in the mountains of California, in both of which states the taste and demand for them is largely on the increase. Though I have disposed of more than one hundred head this season, I yet have respectable flocks of both pure, and of full bloods, and I find them profitable, even in this blue grass region, where lands are high comparatively.

ROBERT W. SCOTT.

Near Frankfort, Ky., Nov. 4, 1875.

Foot Rot in Sheep.

As there are getting to be more and more cases of foot-rot among sheep on this coast particularly in Oregon and in Mountain Meadow valleys, and we have been asked for advice on this subject we think that we can do no better than to give an article on this disease from the *National Live Stock Journal*, which is good authority:

Usually the first intimation the shepherd has of the presence of foot-rot is the limping of the affected animals. If the sheep had been carefully examined before this, there would have been noticed in the cleft of the foot, just above the horny covering, a moist irritated appearance, omitting a peculiar disagreeable odor. This is usually present several days before lameness is manifested. The disease, from this first stage, usually passes under the shell of the hoof, at the heel, gradually working and widening until the entire foot is affected, unless arrested by artificial appliances. A feverish condition of the entire foot is apparent, when taken in the hand. Occasionally a foot may be found that has ulcerated, as the effect of injury from some cause or other: but the peculiar odor that is inseperable from the foot-rot is wanting.

There has been much discussion as to the origin of foot-rot, some flock-masters contending that it originates from continuous confinement in foul pens of stables, or by pasturage on low, swampy grounds. As this is a question upon which the "doctors disagree," we will not enter upon its discussion here, but relegate it to the experience of the readers of the *Journal*, with the remark that, in a pretty expensive experience with large and small flocks of sheep, we have never met with a well defined case of foot-rot that was not traceable to contact with diseased animals. The determining of the possibility of engendering the disease by confinement upon foul floors, and by neglect, has a certain value from a scientific standpoint—and we will be glad to get experiences tending to prove the fact or fallacy of such a theory. Practically considered, the flock-master is contented with the knowledge of the rule that, to keep his sheep free from the possibility of contact with the presence or walks of affected animals insures them exemption from foot-rot. The exceptions to this will be found so rare that they need not excite solicitude.

The actual presence of foot-rot in the flock determined, the question of the hour is, not so much how came it there, as how it is to be eradicated. Before discussing any of the numerous remedies proposed, all affected animals should be picked from the flocks and confined so as to render impossible further spread of the disease by inoculation from them. As fast as further cases are noticed—as most likely there will be—these, too, must be culled out. Unless this course is pursued, a large proportion of the animals in the flock will, in time, be affected. The next step is to get the healthy animals off the ground frequented by the diseased ones—and to keep them off for several weeks at least. until sun and rains have thoroughly purified the surface and herbage. As soon as possible every animal in the flock should be examined carefully—every foot being scraped and trimmed, when necessary. Let this be thoroughly done, as the animal neglected may have about it the seeds of disease that will in time render all work unavailable—for of foot-rot it may truly said that "one sickly sheep infects the flock and poisons all the rest." As the sheep leaves the hands of the operator it should be placed in a trough filled to the depth of two inches with a decoction of blue vitrol, and be made to walk through this while passing out of the pen. This will tend to destroy any trace of the disease that may have escaped the eye of the operator. Such trough should be eight to twelve feet long, so that each foot will be immersed several times. This process should be repeated at the end of a week or ten days at the farthest, and if repeated a second and third time will only make "assurance doubly sure."

The diseased animals having been separated, should receive immediate attention. The outfit for the operator should consist of a pair of toe-shears, two sharp knives (one heavy one for removing the outside of the the hoof, and a smaller one, with a keen edge, for the more delicate work), a sponge, or cold cloths, for removing blood, and a small bottle of butyr of antimony, or some equally good caustic, for application when the work of the knife has been thoroughly performed. The knife will be found the sheet-anchor of success in treating foot-rot. The last vestige of disease must be cut out—even though it involve the removal of the entire horny covering of the foot. Any less heroic treatment may mitigate, but will not cure the disease. When the diseased portions of the foot are thus laid bare, and as much of the *pus* wiped away as can be done without irritating the exposed parts, the butyr of antimony, or other caustic, should be applied with a soft brush or swab made by tying a piece of

old linen or cotton cloth to the end of a stick. Unless the disease has been present for some length of time, usually but one foot on each animal will be affected, though the sound ones should be cleansed (never using the same knife as on the sore felt,) and treated to an apptication of the caustic as a precautionary measure. But a few days should be allowed to intervene before these invalids are carefully examined—great care being exercised to ascertain that the work has been thoroughly performed. If any of the virus was overlooked in the first operation it will now be apparent. The knife and caustic must again be applied; and this vigilance continue to be exercised until all the once affected animals are the possessors of sound, healthy feet, when they may be turned with the flock.

Though, as above intimated, it has not been demonstrated that certain flouI and otherwise unfavorable surroundings originate foot-rot, there can be no doubt that such conditions favor its rapid spread, and renders its eradication next to impossible. Such surroundings will be avoided by the experienced flock master at all times. Even the instinct of the sheep will lead them to shun such, while seeking either food or rest.

Precautions against contracting the disease should be used by flock-owners when infected animals are known to be in the vicinity.—These may consist in great care that no animal from the infected flock be allowed to mingle with or cross the range of the healthy sheep; a rigid examination every few weeks, of the feet of the entire flock, as indicated above, and the passage of each animal through the trough of diluted vitrol; and great care that all additions to the number, such as stock rams and choice ewes, are from flocks and neighborhoods exempt from the malady.—Here an ounce of prevention will be worth a good many thousands pounds of cure; for we esteem foot-rot the worst enemy the flock master has to contend with when once it gets headway. Its eradication from large flocks is not an impossibility, but necessitates more watchful care and persistent labor than the average farmer finds the time, or possesses the disposition to bestow.

Apiary.

SILAS HIVING BEES.

How He Expected to Do It, and How He Didn't.

The old gentleman's name is Silas, and that of his eldest son is George; his wife's name is Matilda, and his three pretty daughters are named Helen, Alice and Susie; there is a little Silas, too, and an older boy whose name is too queer to mention.

The bees had alighted in a great bunch, as large as a half-bushel measure, on the limb of a peach tree in the yard. A table is placed under the overhanging limb, spread with a clean white cloth, and the hive placed thereon.

Then one of the boys, one that is good for nothing else, is sent into the tree to sever the limb; the limb comes down slowly and easily, and the old gent below, dressed in a great coat, buckskin gloves, cowhide boots, and a bed quilt tied around his neck and face, slyly manipulates a twig from the tree, and in two minutes has safely coaxed every bee into the hive, during all of which time Matilda and Helen and Alice and Susie pound the bottoms out of just four tin pans; little Silas does his prettiest yelling, while the boy with the queer name is just old enough and sharp enough to slip behind the house and wait for the thing to come to a point. That is the way the thing ought to have gone off; but that isn't the way it did. Silas, the elder, was very comfortably bundled up for so warm a day, and he had his suit well arranged, only he forgot to tie the strings around the bottom of his pants legs.

The bees had settled on the limb of a peach tree, and Silas, when his table and white cloth and his hive already, commanded:

"Now, George, grab that old rusty saw and climb; I guess you can cut that small limb off easy enough."

George was just home from a six month's term of school, and he felt a great tenderness for his father, and would have gone through a patch of thistles bare foot to please the old gent, and yet he had a particular dread for the "business end" of a bee, and particularly of such a crowd of them. But he obeyed, and began to fiddle away cautiously upon the particular limb. One little bunch of bees dropped off and were caged; another, and another small bunch dropped, and the prospect seemed good, when suddenly an old honey-maker appeared, who had been in the business, soared upward. George shut up one eye quick, gave one terrific surge on the old rusty saw, got out of that tree at one jump and his anxious mother caught a glimpse of him as he flew around the corner of the barn twenty rods away.

But poor old Silas! The bees came down, and he thought the bunch was as big as a hay-stack now. They did not go into the hive, but they went through his over-coat and bed-quilt as if these had been only mosquito bars, and they climbed up his pants legs, and the old gent danced as he had never danced before; and he slapped his legs, as he had never allowed any one else to slap them, and his voice towered high above the clatter of the tin pans and the shrieks of little Silas as he yelled:

"Throw water on me! throw water on me! soak me, wet me down!"

He rolled three or four times over in the grass, and sprang up, shouting, "slap me! slap me! Can't you slap me?" in the midst of which little Silas crept up behind his infuriated papa and dealt him a lively one with a shingle; but poor little Silas landed the next second against the milk-house, for his pa took him and his shingle for a thousand bees, and gently brushed them off.

Oh, the agony of that three mitutes jig! He appended to his wife.

"Matilda, for heaven sake, bring me another pair of pants, won't you!"

But these things don't last always, any more than any other happiness, and after a few minutes the old gent came limping out of the cellar with the breeches on that Matilda brought him, feeling quite easier, but certainly much fatigued, just as George got back from the barn and the boy with the queer name slipped around the corner of the house. Both boys were to anxious know how matters stood, and asked:

"Did you git 'em hived, pa?"

But the old man was too mad to answer, or even look at his boys. He turned to Silas and said:

"Little one you meant all right, and I'm sorry I cuffed you so; next time don't slap so hard."

Then to his wife, "Matilda, to you I owe everything. Accept my heartfelt gratitude. We'll take no more stock in bees. I have made up my mind, and its settled, May our quiet, peaceful farm home never be so stirred up again. Seems to me I never had so much of life crowded into a few short minutes before. Run after the cows now, boys; be off for its almost dark."

Why Bees Work in the Dark.—A lifetime might be spent in the mysteries hidden in a bee-hive and still half the secrets would be undiscovered. The formation of the cell has long been a celebrated problem for the mathematicion, whilst the changes which the honey undergoes offer at least an equal interest to the chemist. Every one knows what honey fresh from the comb is like. It is clear, yellow syrup, without a trace of solid sugar in it. Upon straining, however, it gradually assumes a crystalline appearance—it *candies*, as the saying is, and ultimately becomes a solid mass of sugar. It has not been suspected that this change was due to a photographic action; that the same agent which alters the molecular arrangement of iodide of silver on the excited collodian plate and determines the formation of chaunphor and iodine crystals in a bottle, causes the syrup honey to assume a crystalline form. This, however, is the case. M. Scheibler has enclosed honey in stoppered flasks, some of which he has kept in perfect darkness, whilst others have been exposed to the light. The invariable result has been that the sunned portion rapidly crystallizes, whilst that kept in the dark has remained perfectly liquid. We now see why bees are so careful to work in perfect darkness, and why they are so careful to obscure the glass windows which are sometimes placed in their hives. The existence of their young dspends on the liqnidity of the saccharine food presented to them, and if light were allowed access to this in all probability it would prove fatal to the inmates of the hive. *Working Farmer.*

Our Heavy Product.—The Los Angeles *Express* says: "It is stated that the honey product of San Diego county this year will be fully six hundred tons. One million two hundred thousand pounds of honey is prodigions for an industry only about three years old. Los Angeles county, also, is making tremendous advances in honey culture, and in a few years the two counties will supply the world. The honey of Southern California is without a rival in quality and flavor in the market. It is only during the last twenty years that bees were known in California, and to-day the business of apiarist promises to be one of the most important in the southern portion of the State."

Feeding Bees.—J. F. Montgomery, of Lincoln county, Tennessee, tells the readers of the Fayetteville *Observer* that every person owning bees, whether few or many, should now commence f—ding them with rye flour ground fine and unbolted. This is done by placing the flour in a shallow box or trough in the bee yard, where the sun can shine on it. A rag dipped into honey or sugar syrup should be laid on the flour, to attract the bees to it. On warm days will see the little fellows busily engaged rolling it up on their legs and carrying it into the hive to feed the young bees on. If rye cannot be obtained, unbolted wheat flour is a good substitute. If any one disbelieves the above statement, let him get the flour and try the experiment and he soon will be convieed of the fact.

Potato Blight in Marin County.—The loss by the potato blight has not been exaggerated. On many ranches the crop is a total failure, and on others it is less than half. John Griffin last year raised on 45 acres 3,000 sacks. This year he has 65 acres, and will be glad to get 1,500 sacks. Mr. Mulvaney has 30 acres and has turned his stock on them. D. Callan has 20 acres not worth digging. George Fleeman has 100 acres which he will not dig. J. P. Whittaker will get about 200 sacks from 25 acres. W. R. Fairbanks, George Dillon and M. Calliher, with some others, will get a good average crop. Those planted on low, moist ground seem to escape the blight and do well, while other fields that escape the blight are barren from drouth.—*Marin County Journal.*

The failures during the nine months of the present year in the United States foot up the enormous amount of $131,172,503. Extravagance has been the rule in the Eastern States for the last ten or twelve years. The country is now going back to first principles, and it will be well for all classes to reduce expenses as soon as possible.

Will some benevolently inclined friend donate us a newspaper published this Fall which does not allude to the fact that "the melancholy days have come."—*Bric-a-brac.*

Capital and Labor.

The Danger of Borrowing.

"The borrower is servant to the lender."—Holy Writ.

BY JNO. D. SCOTT, M. D.

To Agriculturist:—I have been informed that no one, no matter what his standing or wealth, can borrow a dollar from any of our banks. A gentleman in this city, with some fifty thousand dollars, was indebted to one of our money-lenders in the sum of a thousand dollars. The lender demanded his money—said he must have it—swore he could not do without it. The borrower tried hard to get a loan to that amount from our banks, and notwithstanding his offer of unexceptional security, he utterly failed to command the accommodation. Returning to old money-bags he informed that "pound of flesh" individual of the fact. Shylock then very coolly remarked, that in as much as the borrower could not pay his note, that he must give him a new one, at one and a half per cent. interest per month. As there was no other alternative he was forced to submit to the extortion. As there is no business in California, except it be highway robbery, that will warrant borrowing money at a greater interest than six or eight per cent. per annum, it will readily be seen how grievously this man has been wronged and robbed in the above transaction. It matters not whether a robber levels a legal or an iron blunderbuss at his defenceless neighbor's head. The effect is the same—the exaction of money by force. The wretched borrower might just as well fall in the highway as to suffer a lingering death in the spider-webs of the law.

It seems then that old Shylock could have done without his money after all. It was simply a dodge on his part to extort more interest. But he must have known beforehand that the banks would not loan under any circumstances, or he would not have resorted to the trick. Are the brokers and bankers in league to rob the public? Are they all in collusion to get up a corner in the money-market in order to raise interest up to the old and ruinous rates of one and a half and two per cent. per month? This simultaneous action looks very much like it or else we have a very striking coincidence!

Such conduct on the part of banks and bankers is highly reprehensible if not criminal. They are the reservoirs of capital as our mountain lakes might be supposed to be the reservoirs of water. The one would serve to furnish the life-giving element to our extended plains in times of drought, whilst the others should open their vaults and transfuse new life and rigor into the veins of trade in times of financial distress. It is in a dry season that farmers need water to perfect their crops. They want no irrigation when the heavens open and deluge their lands with floods. So in prosperous times merchants do not need so much bank accommodation. But when trade slackens and business becomes dull they need bank assistance to tide them over that period of dullness. But banks and bankers however pursued exactly the opposite course. When the money-market becomes tight, they tighten up their purse strings also. Their safe doors are slammed to, close as wrter-tight clam shells. This suicidal policy only serves to make money scarcer, to deepen distrust and to spread the panic wider. Perfectly responsible parties then go to the wall who never would have failed if there had never been a bank. In fact, this system of bank credit is an artificial and a stimulative one. It is like liquor, the more a man indulges in it, the more he wants, until at length he begins to think that he cannot exist without it. It is either drink or die, borrow or bust!

These institutions by thus affording ready facilities for borrowing money, do, most undoubtedly, stimulate the desire for adventure and foster the spirit of speculation. When they themselves, therefore, have helped to create a speculative tendency, how cruel, not to say criminal, to shut down the flood-gates at once and see a whole community perish without a single effort at relief. This State is dotted all over with these sad examples. It was in this way that nine-tenths of the native Californians have been dispoiled of their ranches and homes now worth many millions of dollars. It is in this way that many American farmers have been reaved from the trouble and responsibility of running their farms. The banks, or the friends of the banks run their farms for them. Two notable instances occur to my mind at this moment, one was an enterprising nurseryman and fruit raiser; he had a most valuable place of near an hundred acres, and of course his credit in bank was good. Alas! too good! for *now the bank is running the place for him.* The other was a hop-raiser and owned, perhaps, the best cultivated and most valuable hop-ranch in the State. His credit, too, became too good in the banks *and one of them has kindly relieved him of the labor of ever picking hops any more.* It soon made him hop higher than a Kansas grasshopper. And so these banks have served thousands of others. They loan their money and when a dry season comes and their crops fail, and they are utterly unable either to borrow or remortgage, then these financial vultures scoop down upon them and feed upon their heart's blood. But then the murder and robbery are all according to law! The law makes no allowance for the dispensations of Providence! The law has no mercy—no charity—and the pious capitalist who pays pew rent, religiously in a fashionable church, thinks he has a right to impoverish and beggar his neighbor if he has the legal power to do so. "It is so nominated in the bond."

Mr. Girard, the great banker and philanthropist of the centennial city, understood these matters better than the curbstone banker of to-day. He had it in his power during a well reimbursed financial crash to break up half the merchants in Philadelphia, and to add a quarter of the real estate to his exchequer. "There were millions in it," as a San Francisco banker would have exclaimed. His cashier approached him and informed him that all the other banks in the country had stopped making any loans, and asked him whether they should do the same. "No, sir," said Mr. Girard, *"when men need money that's the time they want it;* let *our* customers have all the money they want." The consequence was that he carried his friends triumphantly through the crises, whilst the customers of the other banks *and the banks themselves*, all went to the dogs. We fear that it would be difficult to teach our bankers anything like this—the idea may be too large to enter their diminutive calibres.

If our banks, after absorbing all the available and floating capital in the community, are, like the dog in the manger, indisposed to use it themselves, or to allow any body else to do so, except favored stockholders, the people have the proper remedy in their own hands. It is, *to deposit no more money with them and to withdraw what they have already deposited.* When an institution, like a bank, has ceased to perform the function, monetary relief, for which it was founded, it has outgrown its usefulness, and like any other nuisance, ought to be abated. We want blessings not curses in the community. Better have no reservoirs at all than those stagnant, miasmatic death-dealing cess-pools.

Which Shall Rule—Nine-Tenths or One-Tenth?—About one-half of our population belong to the farming class. About one-quarter of our population belong to the mechanical class. And about fifteen per cent. of our population are laborerers who make their living by their muscle. Has any one ever asked himself how much legislation is done by this ninety per cent. of our population? Is it not a patent fact that they have scarcely any influence in our National Legislation? The truth is, the legislation of the country is shaped and controlled by less than one tenth of the population. It is made in the interest of capital, instead of the interests of the people. And this is the reason there is so much suffering among the industrial classes to-day. There has never been such a concentration of capital going on as within the past few years, and a concentration of capital brings a concentration of political and law-making power. Capital has got the people within its toils. Can they release themselves? This is an important question. This must form a great political issue. If one-tenth of the people are to govern nine-tenths, and make them subservito their peculiar interests, it is time we were awakening to that fact. It can do no harm to bestow a little thought upon this matter.

An Eastern farmer would get rich on what a California farmer throws away. Nineteen-twentieths of the farmers of this State, not only hay all their vegetables, but also their meats, fruits, butter, cheese, flour and corn meal, and even a great many buy the very eggs they eat. Shittless! of course it is—but true, nevertheless. This is not all. Hired help are treated like Digger Indians; they sleep in the barn or haystack; have no accommodations or conveniences that a white man is entitled to; and the results are degrading and demoralizing to the laborer. The hired man at the East is treated as a gentleman; he has his tidy room, comfortable bed, clean sheets, and is surrounded by the refining influences of civilization. Here, in California, how different. Even the employers themselves, in many instances cannot boast anything refining about them or their premises; not even a flower or shrub to soften the dreariness of the spot they call home. California has not yet entirely risen from the chaos of its first social and political period. There is much work for the future on the golden shores of the placid Pacific. When our people begin to build homes, with all the attractions that surround Eastern homesteads, and resolve to live, instead of merely existeng then will the landscape blossom as the rose. —*Ex.*

Interest Too High.—It is estimated that the increase of wealth in the United States does not exceed three per cent. per annum. But men who have money to loan are not willing to take this increase, but charge at least ten per cent. In this way labor becomes bankrupt. Wealth finally gets away all the earnings of the industrial classes. It absorbs as the sponge absorbs water. A cheaper rate of interest is in same way demanded. Capital is absorbing the wealth of the people too rapidly.

In the States, as a whole, the number of acres is 32 to the hand employed; in Alabama, 17 acres; in Arkansas, 18 acres; in Georgia, 20 acres; in Illinois, 51 acres; in Indiana, 38 acres; in Mississippi, 21 acres; in Missouri, 35 acres; in Oregon, 85 acres; in Tennessee, 26 acres; in Texas, 18 acres; in California, 129 acres. To illustrate: California had in cultivation 6,218,133 acres, worked by 47,863 people. The Californian takes care of more than seven times as many acres as the Alabamain.

Household Reading.

Country Maidens.

BY GEORGE W. SEARS.

THEY sat with their small, white feet in the brook,
Two country maidens of beauty rare—
Kate, with her bright, ringlet look,
And blue-eyed Blanche, with her golden hair.

The air was fragrant with new-mown hay,
The wild bee wrought with a drowsy hum,
And they chatted the dreamy hours away,
With girlish plans for the years to come.

And she with the eyes of sparkling jet
Would be content as a farmer's wife,
To shun the follies that wear and fret
For the simple pleasures of country life.

Then Blanche with her eyes of sparkling blue
Shook down a river of sunny hair,
That rippled and flowed in golden hue
O'er bosom and neck and shoulders bare.

"And I," she said, "shall live in the town,
With lackeys to come and go at call;
And I shall be proud if men will me crown
Queen of beauty at rout or ball.

"My husband shall be a millionaire."
Oh, surely you guess your future life!
On you, with your beauty rich and rare,
Shall fall the lot of a farmer's wife.

And red-lipped Kate, with her midnight curls,
Shall win the riches for which you pine.
Her brow shall glisten with gems and pearls,
Her table with plate and costly wine.

But she shall long for the new-mown hay,
And the shadows upon the upland leas,
And sicken and tire of her splendid way,
And sigh for brooks and birds and trees

And you will sneer at your narrow lot,
Weary and tire of your household cares,
And each shall covet what each hath not,
And pine for the burden the other wears.

Oh, city dame and farmer's wife,
Each from the other too long estranged,
Ye were two jewels of love and life,
If but the settings were turned and changed.

Chats With Farmers' Wives and Daughters---No. 12.

BY "JEWELL."

Having had a little taste of farm life this past Summer, I feel more capable of offering advice or sympathy to the wives and daughters upon what might otherwise seem beyond my cognizance. But knowing how it is myself, and feeling that much unhappiness is caused by ignorant neglect, I think it a positive duty to mention a few of the unpleasant things about farm life to women.

First, the inconvenience of most of the farmhouses. Water in a well or tank some distance from the kitchen, where it all has to be carried for cooking, washing and other purposes; no sink to carry off the waste water, which in turn must be all carried out again: no boiler and water back to the stove to give a plentiful supply of warm water; no bathroom and few closets. In fact, a roof and a floor, with a few partitions, constitute the majority of our farmers' homes, where the wives and daughters spend the most of their lives.

Second, the drudgery of early rising, continued cooking and washing dishes, besides the accompanying washing and ironing, churning, with its heavy washings, scalding of pans, etc., making many a delicate woman an invalid by overworking when not equal to more than the actual cares of maternity.

Third, the extra amount of strength required to go to town, if the farm is any distance out in the country, takes from the enjoyment of the trip as a pleasure. Consequently the women-folks go only as a duty, when goods are to be purchased needing their selection; and with two or three children to take, and carry the whole distance makes the day indeed a hard one.

Then, usually, there are no horses on the farm a woman can drive to visit neighbors, so that pleasure is denied her unless the menfolks are going that way, and she is then at their disposal when to go or come. Indeed, she seems as much a chattel on the farm, useful and maybe ornamental, as any of the farm stock or high-priced farm implements belonging thereto. Certainly she is a necessity to do the drudgery and *woman's work*, and a companion to talk to when indoors, but as to making her labors light by giving a helping hand, or adding conveniences for work, or providing conveyances she or the girls can drive when or where they wish, how many farmers do it? That is just the question I wish to ask and have answered. I hope fifty in this valley may say in all truth they are thus favored, but I fear not more than five can honestly say it. The farmers say, "times are hard—can't afford it;" or, "crops have failed the past few years, and when it comes a good year I'm going to fix up things," etc. But, my good friends, don't you see your wives working under disadvantages, careworn and failing in health daily? your daughters losing their interest in the home that should be so dear to them, and longing for a home in town, or anywhere else but just where it is? Nothing seems pleasant where all is hard work with no freshness of improvement.

This is plain talk, but it is the truth in many a home; and I have seen enough of farm life to know that the men have many an idle day or week which might easily be improved by adding conveniences for the wife, or improving the flower-garden, or by giving a helping hand indoors, instead of spending it in town or visiting some neighbor *on business*. Let me whisper a word in the ear of fathers and sons: If you believe wives and daughters are blessings in farmers' homes, see to it that your farms are kept thrifty, your fences and gates firm and true, your cattle well-fed, fields well tilled and homes convenient and attractive, and my word for it, you will not complain of whole neighborhoods destitute of true and noble women to cheer and aid in your labours: and when you do have families you will be as much a blessing to them as you expect them to be to you. There is no modern convenience in city homes that might not have a counterpart in country homes, and no woman should be expected to do all the drudgery of inside farm work without such conveniences, at least, as will save steps and make as light as possible the necessary work of the family.

Grandfather's Letters---No. 3.

EVENTS OF THE LAST CENTURY,—A LOVE-LETTER AND MA'S AND SUSIE'S REMARKS THEREON.

On breaking open an envelope the other morning, Angie exclaimed: "Why, ma! I declare, here's a love-letter! I know it is one from its length. I wonder who that can be from." "Oh," replies ma, "it must be from one of your old beaux, or perhaps, and better, from one of your late conquests. Well, do read and let's see what it is." "I guess you may be right, ma: for it has such a long address—begins, 'My darling, precious, beloved Angie!'" "Why, that's good; go on," says ma. "'I think of you, talk of you, write of you, and I love you.'" "Better yet, if he only proves worthy of you. Beware of giving him the mitten." "I wonder he does not say he dreams of me." "Oh, that is only the sleeping thinkings; you may be sure he does that. Well, go on."

"'I have in these few words stated my position towards you. These are the heart's impulses; there are those of the head to be thought of by-and-by. First, those of the heart: You know there is such a thing as attraction and repulsion; every one must have experienced this—how readily the best feelings of our nature flow out towards some, while from others we are repulsed, when but little, if anything, has passed between either. I mark this as a fact, without pretending altogether to account for the cause. Suffice it to say, you have proved for a long time attractive to me; hence, my language at the commencement of this letter, and its result in the whole letter itself. If is but fair and just to yourself, dear Angie, to account for this attraction, so far as I am able, and I wonder others have not seen the darling Angie as I have seen her.'" "Can't forget the endearing epithets, can he," says ma. "'I have observed that polite courteousness of manner and kindliness of demeanor towards all, under the varying circumstances and phases of life, and I know it to be inherent in your very nature.

"'I have observed too, your attentive deference to your dear ma's slightest wishes, your counseling her on slight as well as more important occasions, your readiness to lend a helping-hand to your brother out doors, to ornament the parlor or assist in the kitchen, and surround the porch with Nature's loveliest beauties, and besides all this an abnegation of self in favor of those around you.

"'Can you wonder, beloved Angie, my mind dwelling on all this till you have become precious to my memory, at my addressing you in the language of this letter?'" "Why, who can it be?" again exclaims ma. "We'll soon see," says Angie, "for I am near the end of the letter. It goes on, 'I fancy you want to know, by this time, who it is that thus addresses you, and what's the meaning of all this? To the first question I answer, you must guess. You have so many visitors to whom the same things are open and palpable as to myself, that I feel you are about as likely to guess wrong as right. If you have been a very close observer the chances may be in favor of your guessing right. The reason for the *nom de plume* will be explained hereafter, if occasion require. As to the other question, dear Angie, you will do me the favor to let me know if I may cherish those sentiments with which I began this epistle, or if I must quash them. Rely on their genuineness and sincerity; but of your condition and circumstances I am too ignorant to know if they can go beyond mere sentiment, so anxiously await your reply to

INGLEWOOD.'"

It's all right to talk about bringing up a child in the way he should go, but the other day, when a Third-street woman set out to do it, a man halted at the gate and shouted, "Go in, mother—cripple the boy for life!" and a woman leaned over the fence and screamed, "Why don't you cut his throat?" and a boy climbed on the alley fence and cried out, "Why in blazes a'nt the reporters around here to get this a-w-f-u-l tragedy?" And the mother had to stop pounding and go into the house.—*Detroit Free P*

Domestic.

Our Own.

I had known in the morning,
How wearily all the day,
The words unkind
Would trouble my mind
I said when you went away.
I had been more careful, darling,
Nor given you needless pain;
But "we vex our own"
With look and tone
We might never turn back again,

For though in the quiet evening
You may give me a kiss of peace,
Yet it might be
That never for me
The pain of the heart should never cease.
How many go forth in the morning
That never come home at night;
And hearts have broken
For harsh words spoken.
We have careful thoughts for the stranger,
And smiles for the sometime guest,
But oft for our own
The bitter tone.
Though we love "our own" the best.
Ah! lips with the curve impatient,
Ah! brow with that look of scorn;
'Twere a cruel fate
Were the night too late
To undo the work of morn.

Familiar Talks---No. 4.

BY SNIP.

FRIED CAULIFLOWER

Is a favorite dish with us, but seems to be unknown to all who have not eaten it here or hear it spoken of. It is a breakfast dish with us, and is prepared in this manner: The cauliflower is boiled and mashed, as you would mash potatoes, in the evening, and mixed with pepper and salt, and if you like, a little butter. In the morning make a batter, not very thin, of flour and milk and one egg, for two small heads of cauliflower. Fry in small cakes—about two tablespoonfuls for a cake—and be careful it does not burn.

I here give some of my favorite recipes. The first has no name, so you may call it what you like:

Take some mashed potatoes, or boil and mash some. If the latter, mix in some butter or cream, or if you have it, some good meat gravy. Season to suit your taste and put a layer in a deep dish; upon this place a layer of finely minced meat, seasoned to suit. Alternate in this way until the dish is filled. Then spread the top thick with bread-crumbs and bake until quite brown.

BOILED BREAD PUDDING.

Crumb your stale bread in a pail that has a tight-fitting cover. Cover the bread with sweet milk and put it by the stove to warm and soften. Then to every quart of the mixture add two well-beaten eggs, a cup of sugar, a handful of raisins or sweet dried fruit of any kind. Do not have the pail full, as it will rise some. Set it in a kettle of boiling water, having the cover on tightly, and boil about an hour. It is superior to baked bread pudding.

UNCLE SNOOP'S COOKIES.

One cup of sugar, one-half cup of butter or lard, one teaspoonful of soda, two teaspoonfuls of cream-tartar, two-thirds of a cup of water. The thinner they are rolled the better. If made of lard they will need to be made thin.

CREAM CAKE.

One cup of sour cream, one cup of sugar, two cups of flour, two eggs, one teaspoonful of soda.

BREAKFAST CAKE.

Four cups of flour. two cups of milk, one half cup of sugar or not as you choose, two eggs, one teaspoon of soda, two teaspoons of cream-tartar. This will make two cakes it baked in tin biscuit pans.

Carving at Table.

BY AUNT MARTHA.

One of the most important acquisitions in the routine of daily life is the ability to carve well, and not only well, but elegantly. Not only at the tables of the aristocratic, but in the circles of middle life, where not all the refinements of cookery are adopted, the utility of a skill in the use of a carving-knife is sufficiently obvious.

In the first place, whatever is to be carved should be set in a dish sufficiently large for turning it if necessary; but the dish itself should not be removed from its position, which should be so close before the carver as to only leave room for the plates. The carving-knife should be light, sharp, well-tempered and of moderate size, strength being less required than skill in the manner of using it.

Large, solid joints, such as ham, fillet of veal and salt beef, should be served in thin slices, while lamb and the like should never be cut in very slender slices.

The art of carving is not attained by the study of books and plates, any more than that of the carpenter or house-builder by the study of architecture; and while these are useful in their place, the art is only made perfect by a regular apprenticeship; and every young man should put himself to this work in early life. It is a very cause of admiration to find such proficients in doing the honors of the table. There are too many, both among the young and the middle-aged, who exhibit the most embarassing awkwardness when called upon to officiate in this capacity at home or abroad.

How to Prepare Feathers for Use.—Before the time comes for killing poultry for market, it is a good plan to prepare two or three bags of coarse, unbleached cloth—one to contain the geese and ducks' feathers, and the other for chickens' and turkeys' feathers. When plucking the poultry, cut off the wings first, and if not needed for dusters, strip off the feathers from the parts nearest the body and then peel off the feathery parts from the quill, but take care that no skin or flesh adheres to any of the feathers. Then put the bags into a brick oven, if you are the fortunate possessor of one, and keep them there, except when the oven is used for baking purposes, taking them out into the wind occasionally and beating them with a stick. When you have collected enough to fill a pillow, cut the shape you desire out of bed-ticking and stitch it round on the wrong side with coarse, well-waxed thread, leaving a small space at one end to put in the feathers. Now lay it on a table, and rub it over on the wrong side with a piece of beeswax, just warmed a little, so as to besmear the ticking. If you cannot obtain the beeswax, common yellow soap will do as well. If you do not wish to use the feathers, either for pillows or sofa-cushions, they can be put into beds that have become a little empty. The geese and duck feathers make the best beds, but the mixed feathers do well for cushions, etc. If any of the skin or flesh adheres to the feathers, they will have a disagreeable, putrid odor, which may seem to be an insurmountable obstacle to their use; but if, after the family wash is finished, the bag, tied up closely at the neck, is put into the boiler of soapsuds and boiled a few moments, moving it about with the clothestick and lifting it up and down and squeezing it out a few times, and is then taken out and hung in the air for several days, and shaken hard, when the feathers become dry they will be light and free from any bad smell, and they can then be put in the oven, and thus kept free from moths and always be ready for use.

Corned Beef.—For every one hundred pounds of beef, after the largest bones have been removed, apply the following: Four pounds of table salt, four pounds of white sugar, two ounces of salt-petre, and two ounces of baking soda. Mix all together and rub every piece of meat thoroughly, and then pack close and firm. In a few days there will be brine enough to cover the meat. The animal heat should be all driven off before packing, and this is really one of the most important conditions to be observed before salting. If beef is killed in warm weather it should be placed in an ice house for forty-eight hours before salting. But the best time to put it down is in late Autumn or Winter, when the weather is cool.

Apple Puffs.—Mix a quarter of a pound of butter with a quart of sifted flour, two eggs, a spoonful of salt and a half-teaspoonful of soda, dissolved in a little cold water. Moisten it with cold water so you can just roll it out easily. Roll as thin as possible and cut into cakes. Put three of them together, sprinkle flour between each one, lay on the top thin slices of tart apples and sprinkle sugar and a little nutmeg over them. Enclose the apple by doubling the pastry over them, pressing the edges well together, and fry in sufficient hot lard to cover them. When of a light brown, take up carefully.

Stewed Fowl.—Fill the inside of a young fowl with oysters, put it into a jar or tin pail tightly closed, and put it into a kettle of water. Boil an hour and a half. There will be a quantity of gravy from the fowl and oysters. Add to it a little flour made smooth in a small quantity of water, some butter, seasoning to taste, and more oysters with their liquor. Serve this with the fowl, which will be very white and tender. All the fine flavor lost in ordinary boiling will be preserved.

How to Preserve Smoked Meats.—Take ground black pepper, the finer the better. Wash all the mold or soil off from the hams or beef, and while they are damp rub them thoroughly with the pepper. Two pounds of pepper will keep thirty pounds of meat free from flies and insects of all kinds. It can remain, after being thus treated, in the smoke-house or wood-house and not a fly will approach it. It also improves the flavor of the meat.

Polishing Shells.—Mrs. Bryan, in the *Western Farm Journal*, says: "My way of cleaning and polishing clam shells is to boil them in very strong lye about half an hour, then scrape them with a knife until I get all the outside crust off. I cleaned some the other day that looked just like pearl. When done they look almost as pretty as sea shells. For the periwinkle, mollusk, etc., I just rub them with a coarse cloth after they have been boiled in the lye. Care must be taken not to boil them too long."

Pocket Mucilage.—Boil one pound of the best white glue and strain very clear; boil also four ounces of isinglass and mix the two together. Place them on a water-bath with half a pound of white sugar, and evaporate till the liquid is quite thick, when it is to be poured into moulds, cut and dried to carry in the pocket. This mucilage immediately dissolves in water, and fastens paper very firmly.

To Take Grease from Wall-paper.—Lay several folds of blotting-paper on the spot, and hold a hot iron near it till the grease is absorbed.

Washing to Stiffen Fine Lace.—Dissolve a lump of white sugar in a wine-glassful of cold water.

☞ *A Choice Specimen* of some elegant plant or flower is often seen in the show-window of Jackson Lewis' Jewelry store, Anzeraais House Block. They are taken from his own private garden and conservatory near the Santa Clara Street Schoolhouse, San Jose. We take a stroll through his grounds occasionally, and know of no place so beautifully snpplied with rare and wonderful plants. Mr. Lewis spends his leisnre hours among his pets, which he knows by name and cultivates understandingly. Any person who wishes to note what plants are suitable for any particular locality, would do well to visit Mr. Lewis's garden, which is worthy of being named the Botanical Garden of San Jose.

☞ Mr, Mitchell, the Seedsman and Florist of San Jose, will display a splendid array of beautiful plants, and ornamental grass and other boquets for Christmas gifts and decorations. His selection of brackets, flower-stands, hanging-baskets, &c., &c., is superb, and such things make acceptable gifts for Christmas, or any other day in the year. His stand is near the Mercury office, opposite the Farmers' Union, on Second street.

☞ *Wilcox* is a man of his word, and his Boots and Shoes are just what he says they are. You can depend upon fair dealing at his store. His neighbors, Smith & Ryder, Jewelers, are also, fair, square, and gentlemanly dealers, we vouch.

☞ The National Gold Medal was awarded to Bradley & Bulofson for the best Photographs in the United States, and the Vienna medal for the best in the world.
429 Montgomery street, San Francisco.

☞ For a fine Christmas present a Chickering piano or Estey organ is just the thing. Smith & Ryder, agents, Wilcox block.

☞ Fine optical goods at Smith & Ryder's for the grandpa and grandma, and other people.

THE number of hogs in Illinois is reported to be over half a million less than last year. At present there is a prospect that the number will be reduced this fall to much below the average. Hog cholera will carry off a good many, and high prices will cause the death of a much larger number. Between the ravages of disease and the ravages of the butcher-knife, it is feared that there will not be enough left for breeding purposes. For the matter of that, there were not enough kept from last year, and the present scarcity is the result.

NEVER, on any consideration, says the Wisconsin *Horticultural Report*, put imperfect or small fruit with larger or better, as it reduces the whole package to the grade of the poorest in it. The strength of a chain is not that of the stoutest, but of the weakest link, and so the worst specimens in a package will drag all the rest down to their level, and you with it in the final reckoning.

GREAT PUBLIC SALE

OF IMPORTED

CLYDESDALE STALLIONS,

TO BE HELD IN THE

CITY OF BLOOMINGTON, ILLINOIS,

ON

Wednesday, January 19th, 1876.

The subscriber will sell, at the time and place above-mentioned, 14 first-class horses imported from Scotland last August, and pronounced by competent judges to be the finest lot of horses ever imported into the United States, consisting of two two-year olds, four three-year olds, weighing from 1500 to 1700 lbs., three four-year olds, weighing from 1800 to 2100 lbs., four five-year olds, weighing from 1800 to 2000 lbs., one six-year old. The sale will include one English Draft-horse and two first-class half-bloods, weighing over 1700 pounds. Part of them have been shown at the Western Fairs of 1875, and have been very successful in the prize ring, although competing against a large number of imported horses. Amongst the lot are the seven-year-prize horse at the McLean County Fair held at Bloomington, twenty-five horses competing; also second prize at St. Louis Fair, sixteen horses competing; first prize in three-year old ring, eight horses competing; besides many other prizes this Fall too numerous to mention.

This is the largest and finest lot of horses ever offered at public sale in the West, and are well worth the attention of horsemen.

SALE WILL BE POSITIVE, to commence at one o'clock sharp.

Terms, one-half cash. A credit of 15 months will be given for the balance, with approved note at 10 per cent. interest, 6 per cent. off for full payment. Catalogue and pedigrees on application.

The horses can be seen any time before the sale at

T. C. DUNCANS,
McLean, McLean County, Ill.

IT PAYS.

IT PAYS EVERY MANUFACTURER, Merchant, Mechanic, Inventor, Farmer, or Professional Man, to keep informed on all the improvements and discoveries of the age. It pays the HEAD OF EVERY FAMILY to introduce into his household a newspaper that is instructive—one that fosters a taste for investigation, and promotes thought and encourages discussion among the members. The

"SCIENTIFIC AMERICAN"

Does this. Every number is profusely illustrated and its contents embrace the latest and most interesting information pertaining to the Industrial, Mechanical, and Scientific Progress of the World. Farmers, Merchants, Mechanics, Engineers, Inventors, Manufacturers, Chemists, Lovers of Science, and People of all Professions, will find the "SCIENTIFIC AMERICAN" useful to them. It should have a place in every Family, Library, Study Office, and Counting Room; in every Reading Room, College and School. A new volume commences **January 1st, 1876.** A year's numbers contain **832 pages** and several hundred engravings.

TERMS: **$3 20** a year by mail, including postage. Discount to Clubs. Special circulars giving Club rates sent free. Single copies mailed on receipt of 10 cents.

PATENTS.—In connection with the "SCIENTIFIC AMERICAN" Messrs. MUNN & Co. are Solicitors of American and Foreign Patents, and have the largest establishment in the world. More than fifty thousand applications have been made for patents through their agency. A special notice is made in the "SCIENTIFIC AMERICAN" of all Inventions Patented through this Agency, with the name and residence of the Patentee. A bound volume containing the Patent Laws, Census of the U. S., and 142 engravings of mechanical movements. Price 25 cents.

Address for the paper, or concerning Patents, MUNN & CO., 37 Park Row, New York. Branch office cor. F & 7th streets, Washington, D. C.

I HAVE FOUNDED MY BUSINESS ON the belief that the public are anxious to get their seed DIRECTLY FROM THE GROWER, and I therefore offer FREE to every man and woman in the United States who cultivates a farm, tills a vegetable garden, or plants a flower garden, my large, Illustrated Catalogue of Vegetable and Flower Seeds for 1876. It contains, in addition to the choicest kinds produced in Europe, ONE HUNDRED AND FIFTY VARIETIES OF VEGETABLE SEED GROWN ON MY FOUR SEED FARMS. Customers of last season need not write for it. As the original introducer of the Hubbard Marblehead and Butman Squashes, Phinney's Melon, the Marblehead Cabbages, and a score of other new vegetables, I solicit your patronage. All three sold under these warrants. A hundred thousand catalogues will be issued and sent out the 1st of January. JAMES J. H. GREGORY, Marblehead, Mass.

Harper's Magazine.

ILLUSTRATED.

Notices of the Press.

The ever-increasing circulation of this excellent monthly proves its continued adaptation to popular desires and needs. Indeed, when we think into how many homes it penetrates every month, we must consider it as one of the educators as well as entertainers of the public mind.—[Boston Globe.

The character which this Magazine possesses for variety, enterprise, artistic wealth, and literary culture that has kept pace with it, if it has not led the times, should cause its conductors to regard it with justifiable complacency. The Magazine has done good and not evil all the days of its life.—[Brooklyn Eagle.

TERMS:

Postage Free to all Subscribers in the United States.

Harper's Bazar.

ILLUSTRATED.

Notices of the Press.

The BAZAR is edited with a combination of tact and talent that we seldom find in any journal; and the journal itself is the organ of the great world of fashion.—[Boston Traveller.

The BAZAR commends itself to every member of the household—to the children by droll and pretty pictures, to the young ladies by its fashion-plates in endless variety, to the provident matron by its pattern for the children's clothes, to paterfamilias by its tasteful designs for embroidered slippers and luxurious dressing-gowns. But the reading-matter of the BAZAR is uniformly of great excellence. The paper has acquired a wide popularity for the fireside enjoyment it affords.—[N. Y. Evening Post.

In its way there is nothing like it. Fresh and trust worthy as a fashion guide, its stories and essays, its poetry and saibs, are all living rating to the mind.—[Chicago Evening Journal.

Harper's Weekly.

ILLUSTRATED.

Notices of the Press.

HARPER'S WEEKLY is the ablest and most powerful illustrated periodical published in the country. Its editorials are scholarly and convincing, and carry much weight. Its illustrations of current events are full and fresh, and are prepared by our best designers. With a circulation of 150,000, the WEEKLY is read by at least a half a million persons, and its influence as an organ of opinion is simply tremendous. The WEEKLY maintains a positive position, and expresses decided views on political and social problems.—[Louisville Courier-Journal.

Its articles are models of high-toned discussion, and its pictorial illustrations are often corroborative arguments of no small force.—[N. Y. Examiner and Chronicle.

Its papers on existent questions and its inimitable cartoons help to mould the sentiments of the country. —[Pittsburg Commercial.

HARPER'S WEEKLY stands at the head of illustrated journals in the United States, in circulation, editorial ability, and pictorial illustration.—[Ladies' Repository, Cincinnati.

THE CAL. AGRICULTURIST PUB. CO

Announces to Subscribers of the AGRICULTURIST that we have made arrangements whereby we can supply almost any desirable book published upon any subject, at publishers' prices, post paid upon receipt of its price.

People living in the country, away from book stores, have experienced difficulty in getting what books they want at any price, and are frequently imposed upon when they do get books.

Now, we propose to remedy this matter entirely, and without further trouble to our patrons than the sending of their orders, accompained with the cash, to select the book they want, and send it to them at publishers' own price, free of other costs. This may seem like a big undertaking on our part, but our arrangements are fully perfected for doing this business, and we mean business!

We shall continue our catalogue of good books from month to month, adding the most desirable books published as fast as we can, within a limited space, that our readers may be then better able to select such works as are really desiable.

IMPORTANT TO SUBSCRIBERS.

We have made further arrangements so that we can offer PREMIUMS OF BOOKS for every prepaid subscription, to old and new subscribers alike; also, extra premiums to clubs. And to every person who solicits subscriptions we give extra premiums of books of his own choosing.

Our premium rates are as follows: Upon each $1 50 subscription, prepaid for 1876 we credit to account of subscriber 50 cents reconed in his favor upon an order for books to the amount of $2 00. In other words, after paying for 1876 upon receiving an order for any book or books at any time worth $2 00, only $1 50 in coin need be sent. This added to the 50 cents to his credit will pay for the books.

CLUB RATES.

(When but $2 00 worth of books are wanted.)

Two Subscriptions, $3 00, and Book worth $2 00, for $4 00; Three Subscriptions, $4 50, and Book worth $2 00, for $5 00; Four Subscriptions, $6 00, and Book worth $2 00, for $6 00.

TO SOLICITORS.

To any one who procures subscriptions, we will credit 50 cents, to be applied to his book account on each $1 50 subscription sent in, besides which we give the subscriber credit also as above shown.

Thus: The agent sending us four subscriptions with $6 00, (the bare subscription price) will be entitled to $2 00 worth of books, his own choice, without further remittance. This gives every young man or woman a chance to get all the reading they want *without cost*, and to the subscriber a chance to get books *below cost*.

We are sure that no better opportunity was ever offered to the public on this coast to obtain good reading. The AGRICULTURIST will be greatly improved for 1876; will be worth more than the subscription price, which is within the reach of every one's means; and our arrangements of giving premiums, is such as to be sure to please and satisfy everybody, whether young or old, rich or poor. We are determined that the AGRICULTURIST shall reach every home on the Pacific slope, and while we propose to be liberal towards all of our subscribers, we hope to be favored by the efforts and good will of each and every reader of good books and of the CALIFORNIA AGRICULTURIST.

A DOMESTIC JAR

—AND—

HOUSEHOLD TUMULT.

Our readers will notice that the Household and Domestic departments look rather mixed on page 23 of this number. In putting the type into the page forms, the columns were set up wrong side to—that is, the column that should have been on the left of the page is set on the right of it. To make everything come right, commence reading the 23d page at the top of the right hand column, and follow the columns from right to left, exactly the same as the Chinese read their papers. This CHINESE PUZZLE is the result of accident, not design, on the part of the compositor.

As our Puzzle department is lacking this month, this practical one of the types may be regarded as equivalent to a remonstrance.

HANNAY BRO.'S

Nurseries.

WE, THE UNDERSIGNED, HAVE BEEN engaged in the Nursery Business for the last ten years in San Jose, and our chief aim has been to grow and produce only the very best varieties of Fruit Trees, and those of a healthy growth, and such trees as will give satisfaction to our patrons. In order that purchasers may know our varieties, and also our prices at wholesale or small lots, we give the following:

ONE YEAR OLD TREES.	Per 100.	Per 1000.	TWO YEAR OLD TREES.	Per 100.	Per 1000.
Apple	$12	$100.		$20	$150
Pear	20	180		28	250
Prune	22	200		30	—
Plum	20	180		28	250
Cherry	22	180		30	260
Peach	12	180		—	—
Nectarine	25	—		—	—
Quince	20	—		—	—
Almond	20	—		—	—
Apricot	25	200		—	—
Fig	—	—		20	—
Currants	5	—		—	—

We also offer a large assortment of the leading kinds of Ornamental and Evergreen Trees. Purchasers who wish choice grown trees are invited to visit our Nurseries and examine our stock, as we know their character and healthy growth will please them. Persons unknown to us, that order trees, should send the cash or good reference, in order to secure their trees.

Our Nursery is situated upon Julian street, one mile east of the Court House.

A Valentine.

Oh, little loveliest lady mine,
What shall I send for your valentine?
Summer and flowers are far away;
Gloomy old Winter is king to-day.
Buds will not blow and sun will not shine;
What shall I do for a valentine?

Prithee, St. Valentine, tell me here,
Why do you come at this time o' year?
Plenty of days when lilies are white;
Plenty of days when sunbeams are bright.
But now, when everything's dark and drear,
Why do you come, St. Valentine dear?

I've searched the garden through and through,
For a bud to tell of my love so true;
But buds were asleep and blossoms were dead,
And the falling snow came down on my head.
So, little loveliest lady mine,
Here is my heart for your valentine!

—St. Nicholas.

RALPH'S VALENTINE.

A Story as Aunt Abby Told It.

BY NELL VAN.

One rainy February day Dr. Pemberton's children, with their cousin George, were all gathered around the dining-room table preparing valentines for the approaching festivity of St. Valentine. No one could excel Cousin George, so the young folks thought, in the making of comic valentines. He had the faculty of producing burlesque likenesses of any one he knew, with bodies of birds or or beasts arranged in the most killing positions, and causing the most intense satisfaction among the young folks, while Bertha selected suitable verses from a book of promiscuous poems. The sedate Arthur was arranging sentimental valentines of gilt and perforated paper, profusely ornamented with decalcomanie birds and flowers and tinted tissue paper trimming. They were having a most delightful time, when, as is often the case, an altercation arose between the younger ones because George could not draw fast enough for Susy and Jane to color, and Tom declared it was his turn to have the next to paint, and so on, when Aunt Abby stepped in to quell the tumult.

She was a kind, motherly soul, without kith or kin in the world, but known everywhere as Aunt Abby. Whenever there was a murmur of discontent among the children, Aunt Abby invariably appeared upon the scene and took her station by the fireside with her everlasting knitting-work, and before she was aware of it she would be telling a story of bygone days to the listening crowd.

"Flutter, flutter! what's the buzz now little folks?" said she, cheerily, as she entered the room just as Arthur was trying to pacify the youngsters. "What's going on here, with all these pieters and papers? Makin' valentines, do ye say? Well, well, when I was young"—

"Yes, that's right, Aunt Abby," said Susy, brightening up, for well she knew those to be the words used to preface a story.

"Yes, a story!" cried another of the group.

"We'll be good if you'll tell us one," said little Jane, quite penitently. Aunt Abby replied:

"Well, I was jest sayin', when I was young we never had nothin' of that sort for valentines. Real flesh and blood valentines were none too good for us in them days. On the mornin' of the fourteenth of February up we would jump and peep out the window, for the first lad we clapped eyes upon was to be our valentine for the year; and though we felt a little shy about naming it, yet somehow or other 'twas sure to come out, and there was no end to the fun we had at the spellin' match, quiltin' bee, or any of the frolics where we young folks were sure to meet."

"And was it the same rule for the boys, Aunt Abby?" adding "for in these days a fellow might watch out for half a day and never see a girl go past"

"Lor' bless you, no, child," said Aunt Abby. "The lads had much the best chance to choose their valentines. They used to go about the town, peeping up at the chamber windows of the gals they knew, or into open doors, a'most sure to see somebody they was lookin' for; and it was droll to see how gallant they'd be to the gal of their choice, or ill-mannered and rude if the wrong one appeared first."

"How well I mind the year that Master Ralph, then a lad of fourteen, passed the Winter at his Cousin Susan's house in Amherst. He had been left an orphan when a little boy, but was a prime favorite among his folks. He was always a studious lad, and so old-fashioned in his talk and ways that it was curious to watch and listen to him. There was quite a tumult in the house on Valentine's day mornin' that year, owin' to the arrival, durin' the night, of a first baby to Miss Susan, as I always called her. You see, when but a slip of a gal, I had gone to live at Miss Susan's mother's house, and after Miss Susan got married to a Colton, who was second cousin to my brother's wife's uncle, I became Aunt Abby to the hull tribe. About this time Brother Tom was took with the janders and died, leavin' me alone in the world, for his wife, Polly Ann, died of grief afore the year was out; so you see nothin' was left for me but to go out nursin'. I did amazin' well, and brought three families safely through the measles and mumps, and no end to the cases of chicken-pox and canker rash I was called in to tend. Well, I was with Miss Susan (Mrs. Colton, I should say) with this first baby, and as I was going down to breakfast that first mornin', who should I meet on the stairs but Ralph. He had heard the news, and seemed proper glad, and mighty anxious to take a peep at the little stranger.

"'Mayn't I see Cousin Susan and the baby, Aunt Abby?' says he to me.

"'Well, yes,' says I, 'certingly; you can walk right in and I'll show you the purty creatur.'

"How softly he stepped in! and after sayin' good mornin' to his Cousin Susan, he watched me pick up the little mite of a baby from its mother's side and lay it across my knee in front of the fire.

"'Oh,' said he, 'what tiny fingers and finger-nails, too!' Then comparing the length of the little hand with his own brown one, he said, 'Do you think mine were ever so small as these?'

"Then I uncovered the feet, and such a time as he made over the funny little toes, and he measured the length of its foot with his fingers, sayin', in his quaint fashion, 'Well, there will be a wife for somebody, eh, Aunt Abby?'

"'Who's your valentine to-day, Ralph?' asked his cousin, from the bed.

"'Why,' said the lad, 'I had not thought of that. This young lady here is the first one I've seen to-day. She must be my valentine this year, and I'll take a kiss to seal the compact;' so, pressing his lips to the soft baby cheek, he said, 'You'll be my valentine, eh, baby? silence gives consent, you see,' and with a murmur of applause from baby's mamma, Ralph kissed his hand to her, said 'bye-bye' to baby and was gone.

"Well, as the years passed on I was at Mrs. Colton's off and on, till that pretty baby had grown into a blooming lass, with dark, curling hair and eyes like night. They named her Clarindy, and she was right smart with the six younger brothers and sisters, who gave their mother a sight of trouble. The year that Clarindy was sixteen, the measles broke out among the children, followed by the whoopin'-cough, and nothin' would do but that Aunt Abby must be sent for to carry them through. Besides, Clarindy had a beau, and folks said she was to be married in the Spring. True, he was a most double her age, bein' close on to thirty, and a medical man, having gone through his studies, graduated and traveled some, but come to Amherst to settle into practice. I never mistrusted who the Doctor, as they called him, was, till one day I chanced to open the door for him, and there stood before me, as nat'ral as life, Master Ralph! only the bits of whisker half-way down his cheeks made him appear more manly looking. His eyes hit up when he see me and he said:

"'Why Aunt Abby, are you here? Do you remember me?'

"'Indeed I do, Master Ralph,' says I, with clear wonderment.

"'Is Clara in?' he asked; and says I to him, 'Well, yes; she's fixin' to go ridin' with'——

"Before I could say more one of the young ones came out, and seeing who it was, sung out, 'The doctor's come! The doctor's come! Now mayn't I ask him to let me go too?'

"And this, then, was Clarindy's lover; the same boy, Ralph, grown into a han'som' doctor, a goin' to claim for his wife the valentine of his boyhood! Oh, children, truth is stranger than fiction every time."

"Tell us more," said little Jane.

"What became of them?" asked sedate Bertha.

"Do tell us more, dear Aunt Abby," said Susie, with enthusiasm.

"Well, children," slowly resumed Aunt Abby, "the last time I see any of the doctor's family was one rainy day in February, when I stepped in to quiet the children, who were skirmishin' over the makin' of valentines."

"Just like me," said little Jane.

"So," continued the old lady, "I dropped into a chair with my knittin' work and set out to tell them of bygone days and the true story of Dr. Ralph Pemberton's valentine."

"Oh, that's a good one," said George. "I knew all along it was Uncle Ralph and Aunt Clara you were telling about."

"Was it Papa and Mamma, really, truly, Aunt Abby?" asked little Jane, while Bertha and Sue uttered little exclamations of surprise.

"Of course it's true, simpleton," spoke Arthur. "Don't you know Mamma's birthday is on St. Valentine's day, and her name is Clara while Pa's is Ralph?"

"Why no," said the persistent little Jane; "Papa is only Pa and Doctor, and Mamma is—well, Papa calls her Deary and we call her Mamma, you know."

FAVORABLE NOTICES.

We are under obligations to the local press generally over the State for many flattering notices of our new volume. We make room for but one this month, and give that because it comes wholly unexpected from one of our home papers. We value the notice all the more highly for, as a general rule, there is a sort of jealousy existing between papers published in the same town, which prevents the expression of a good will. But the *Patriot*, under its present management, is able to be independent of and above petty meaness, and is conducted in a manner to gain the respect and confidence of its readers.

"The California Agriculturist.—The first number of the seventh volume of this magnificent periodical is before us, and we are proud of it. The California Agriculturist and Live Stock Journal, to use its proper title, is a publication which reflects honor on the taste, intellect and progressive spirit of San Jose. It is a magazine, no more of the special interests indicated by its name, than a journal of general art, knowledge, literature and fine miscellany. Thus, in the splendid number on our table we find, besides a variety of able editorials, whole departments well filled with essays on many important subjects, such as gardening, hygiene, stock rasing, education, pisciculture, etc. A history of the State Normal School (with illustrations) will be found, together with a week's reading of the most interesting matter for old and young, for the farmer, artisan, scholar, housekeeper; in fact it is a magazine for everybody, and better worth the subscription price—$1.50—than any similar work in the country. Office over the San Jose Savings Bank.—*San Jose Patriot, Jan.* 18.

Stone jars which have become offensive and unfit for use, may be rendered perfectly sweet by packing them full of earth and letting them stand two or three weeks.

California Agriculturist

SPECIAL TERMS TO AGENTS.

RATES OF ADVERTISING:

Per one Column	$12 00 Per Month
" half Column	6 00 " "
" fourth Column	3 00 " "
" eighth Column	2 00 " "
" sixteenth Column	1 00 " "

☞ We are determined to adhere to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

EDITORIAL NOTES.

Back Numbers.—With the exception of the August number, we have several complete files of the AGRICULTURIST for 1875 to spare. Subscribers who lack copies to complete their files should send orders in at once, and as long as we have any to spare we will forward them to you by mail, free of expense.

Sumac Seed.—Mr. Jacob Eberhardt, of the Santa Clara Tannery, has left at our office for distribution a sack of sumac seed. Such of our subscribers as would like to experiment with the cultivation of the plant can have a package sent to their address by ordering the same. The sumac is a tree well known east of the Rocky mountains, and is valuable chiefly for its tanning properties.

Thanks to the few subscribers who have responded promptly to the statements of accounts lately sent out. Angels' visits are said to be few and far between. Perhaps for this reason they are all the better appreciated. But when it comes to paying our bills, we sometimes are compelled to think we could appreciate a more profuse shower of postal money orders, etc. But then, we may be happy yet.

Senator Lane is doing a good work for retrenching the enormous fees and salaries of officials. The people are taxed beyond endurance to feed a lot of cormorants who do more harm than good anyway, and the more pay they get the worse they are, on general principles. Economy and patriotism should crush out these parasites and pay for honest service only, and only pay wages in proportion to the earnings of useful, industrial pursuits. Every cent of pay above that is a premium offered for corruption and extravagance.

The boys and girls did not send their little letters soon enough to get them into their department this month, but they will find more than a page of choice original articles by their favorite friends. Aunt Polly's puzzle has been solved by several who will get a hearing next month. By the way, she is preparing a nice budget for March, and wants you to write to her early. Do not forget, now, but write at once.

A petition to the city to make the San Jose Library free to the public, and to pay $100 per month for its support, is being circulated and generally signed by the citizens. We believe it will be a good thing, for many persons and families who would like to read the books cannot really afford the 50 cents per month now charged for membership. The tax to pay the expenses will not be burdensome to any one, and will be devoted to a noble purpose. The library will be likely to attract many who might otherwise seek demoralizing associations, and must result in much good to every class of the community.

Laying Out the Garden.—Since we wrote the article which can be found under the Vegetable Garden department about laying out, planting and cultivating the garden, we find, in *Coleman's Rural World*, similar advice to its readers by its practical editor, who closes his remarks by saying: "If the readers of the *Rural World* will adopt this system in cultivating their gardens, they will say at the close of the year that the suggestion was worth much more than the subscription price for the year." This is even so, and the readers of this journal may as well take the matter close home in our case.

Pluck will win against odds. Two years ago Mr. Bennett started a furniture factory in San Jose, and several furnitrure dealers tried to beat him out by running down prices and discouraging him in every way. But, although he had little capital, he bent all his energies to his work. He thoroughly understood his business, and attended to it, turned out most superior and elegant work, and commanded patronage and success. He has lately enlarged his manufactory, in new quarters on St. John street, employs some twenty men, and the best of machinery run by steam power. Mr. B. has experienced difficulty in getting good, steady, honest boys to work and learn the trade. The right kind of a boy can find an opportunity, with Mr. Bennett, to learn a good trade. None other need apply.

☞ Business and professional men have long felt the want of an encyclopedia that is at once concise, complete and authoritative, compiled from other books only so far as relates to past events and positive knowledge, and written up by the best living representatives of the various departments of science, art and technical practice, and occupying a small space, so that it can be consulted without overhauling a dozen books to get at a single fact. Such a want seems to have been recognized when Johnson's Cyclopedia was designed. An examination of the first book of the four volumes convinces us that it comes nearer filling the bill than any other work ever published.

The new outside dress of the AGRICULTURIST was designed and engraved by women—Leila Curtis & Co., 606 Montgomery street, San Francisco. The work will speak for itself, and any words of praise from us would be superfluous.

Horticulture.

PLANT TREES.

OUR nurserymen are all doing a good business this season. This shows that the people are planting lots of trees, and we are glad to note the fact. The abundant and long continued rains have put the soil into readiness, so far as Nature can do it. The advice we gave in December and January numbers is applicable now as then. *Plant trees now* if you ever intend to. Plant a good orchard for home use, fence it in against all stock but poultry, and never allow animals to run in it at all. On the windward side plant two or three rows of evergreen trees for a shelter and breakwind. Monterey cypress and pepper trees are *best*, and should be planted not over eight feet apart. Gum trees (Eucalyptus) grow too tall to do much good alone as a shelter, but together with trees of a lower growth are very good.

UNITED STATES ORANGERIES.—In years gone by we have received our chief supply of oranges from Cuba, Spain and Sicily. We now, however, enjoy this delicious fruit all the more because it is grown on our own soil and under our own flag. It has been demonstrated that the United States grows oranges which equal any that are produced in the world. Indeed, some good judges think the Florida orange the best that is grown anywhere. In California the orange is grown to great perfection, and the crop is increasing every year. During this year, also, it has been satisfactorily proved that excellent oranges will grow in Berrin county, Georgia. The Valdosta *Times* is authority for stating that orange culture is well established in other sections of South Georgia. The trees are now in the third year of bearing, and they are in no way inferior to the much admired Florida orange. The same result may be expected in other sections of that State, and in still other Southern States where the experiment has not yet been tried. A greater number of orange groves are being planted in Orange county, Elorida, this year, than ever before during the same length of time, and the same is no doubt true of other counties in the same State. Everywhere, throughout the State of Florida, they are making increased preparations to send larger quantities of this delicious and healthpromoting fruit to the markets of our northern cities.—*Ex.*

LIQUID GRAFTING WAX.—The *Horticulturist* gives the following formula for making Lefort's liquid grafting wax, which is said to have been highly commended in France and until lately kept secret: Melt one pound of common resin over a gentle fire. Add to it an ounce of beet tallow and stir it well. Take it from the fire, let it cool down a little, and then mix with a tablespoonful of spirits of turpentine, and after that about seven ounces of very strong alcohol (sixty-five per cent.), to be had at any drug store. The alcohol cools it down so rapidly that it will be necessary to put it again on the fire, stirring it constantly. Still, the utmost care must be taken to prevent the alcohol from getting inflamed. To avoid this, the best way is to remove the vessel from the fire when the lump that may have been formed commences melting. This must be continued till the whole is a homogeneous mass, similar to honey. After a few days' exposure to the atmosphere in a thin coat, it assumes a whitish color and becomesas hard as stone, being impervious to water or air.

THE SPANISH CHESTNUT.—In all the mountain regions of Spain, France, Italy and Switzerland, their declivities, half way up from the plains below to the snowy peaks above, are clothed with magnificent forests of a species of chestnut, the edible fruit of which, imported into this country, is known as the Spanish chestnut. "Gardner's Farmers' Dictionary" contains the following brief description of this "famous European tree." "The European, also called the Spanish or Italian chestnut, is of immense size and longevity, trees being known which have a girth of sixty feet. The wood, except in very old trees is admirable, being more durable than oak in moist situations. The bark is also used for tanning. It prefers a dry, silicious soil, abounding in silicious matters and potash. The European variety is easily raised from the seed, grows rapidly and bears in seven years. The frnit is five times larger than ours and commands a good price in the market. Chestnuts are used boiled, roasted and raw. In Southern France, Italy, etc., they constitute the bread of a large population." From other sources we learn more of its uses and value as a means of subsistence, than is furnished in this meagre account. During the protracted wars which were formerly waged between the mountain tribes and the cities on the plains, the chestnut formed almost the only article of food which the former could command, and without it they would have been starved into submission in a tenth part of the time required to subdue them by force of arms. Indeed, the chestnut enabled the people in the uplands to maintain long periods of *quasi* independence, and to dictate their own terms when yielding. Not only is this nut eaten boiled and roasted, but it is pulverized and mixed with flour for bread, and may be employed in soups, puddings, etc. The nut is exceedingly nutritious and wholesome, and the present day forms an essential an article for consumption, to very extensive populations, as it ever did in early times, when the means of living were comprised within a smaller compass. Barry thus speaks of the Spanish chestnut, or *Marron*: "This is the large, sweet nut, as large as a horsechestnut, imported from abroad. There are many varieties cultivated in France and England, but that cultivated by the French as *Marron de Lyon* is the best. It is propagated by grafting on the common sorts. It is not reproduced truly from seed, but its seedlings produce large and fine fruits. It bears the second year from the graft and the fourth from the seed"

HOW TO GROW ORANGE TREES FROM SEED,—Save the seeds of a half-dozen nice oranges and plant at once five inches apart, in shallow boxes with perforated bottoms. Let the soil be light and rich. In a year the seedlings should grow from eight to twelve inches. Make them of symmetrical shape now. Screen from frost and heat with light muslin cloth. Sprinkle every night. In the Spring of the second year transplant to separate boxes, and graft them if you hear of any fine variety to do it with. In the third year transplant to the open ground, twelve or fifteen feet apart. The trees can be easily transferred, and either kept in the house or moved about at pleasure to beautify different parts of the garden. Young trees can be moved at any time, because the roots, extending in every direction, hold a fine ball of earth around them.—*Ex.*

Christian Fieldstead, who lives in the foot-hills four miles east of San Jose, has ordered 500 coffee trees two years old, which he intends to test thoroughly.

Poetry.

The Closing Scene.

BY T. B. READ.

WITHIN the sober realm of leafless trees,
The russet year inhaled the dreamy air;
Like some tanned reaper, in his hour of ease,
When all the fields are lying brown and bare.

The gray barns looking from their hazy hills
O'er the dun waters widening in the vales,
Sent down the airs greeting to the mills,
On the dull thunder of alternate flails.

All sights were mellowed and all sounds subdued,
The hills seemed further and the stream sang low,
As in a dream the distant woodman hewed
His winter log with many a muffled blow.

The embattled forests, ere while armed with gold,
The banner bright with every martial hue,
Now stood like some sad, beaten host of old,
Withdrawn afar in Time's remotest blue.

On sombre wings the vulture tried his flight;
The dove scarce heard his sighing mate's complaint;
And, like a star slow drowning in the light,
The village church vane seemed to pale and faint.

The sentinel cock upon the hillside crew—
Crew thrice—and all was stiller than before:
Silent, till some replying warden blew,
His alien horn, and then was heard no more.

Where erst the jay, within the elm's tall crest,
Made garrulous trouble round her unfledged young,
And when the oriole swung her swaying nest,
By every light wind like a censer swung.

Where sang the noisy martins of the eaves,
The busy swallows circling ever near—
Forboding, as the rustic mind believes,
An early harvest and a plenteous year,

Where every bird that waked the vernal feast
Shook the sweet slumber from its wings at morn,
To warn the reaper of the rosy east—
All now was sunless, empty and forlorn.

Alone, from out the stubble, piped the quail,
And croaked the crow through all the dreary gloom;
Alone the pheasant, drumming in the vale,
Made echo in the distance to the cottage loom.

There was no bud, no bloom upon the bowers,
The spiders moved their thin shrouds night by night,
The thistledown, the only ghost of flowers,
Sailed slowly by—passed noiselessly out of sight.

Amid all this, in this most dreary air,
And where the woodbine seeds upon the porch
Its crimson leaves, as if the year stood there,
Firing the floor with its inverted torch;

Amid all this, the center of the scene,
The white-haired matron, with monotonous tread,
Plied the swift wheel, and with her joyous mein
Sat like Fate and watched the flying thread.

She had known sorrow. He had walked with her,
Oft supped and broke with her the ashen crust,
And in the shed leaves still she heard the stir
Of his thick mantle trailing in the dust.

While yet her cheek was bright with summer bloom,
Her country summoned, and she gave up all;
And twice war bowed to her his sable plume—
Regave the sword to rust upon the wall.

Regave the sword, but not the hand that drew
And struck for liberty the trying blow,
Nor him who, to his sire and country true,
Fell mid the ranks of the invading foe.

Long, but not loud, the droning wheel went on,
Like the low murmur of a hive at noon;
Long, but not loud, the memory of the gone
Breathed through her lips a sad and tremulous tone.

At last the thread was snapped, her head was bowed,
Life dropped the distaff through her hands serene;
And loving neighbors soothed her careful shroud
While death and Winter closed the autumn scene.

Growing Weather.

I stood one morning where the sun
Had tipped with golden edges,
The brown, bare hollows of the rocks,
And tufts of ragged sedges;
And from the meadow fragrance near,
Where scythes swung sharp together,
I caught the watchword, "swift, my boys,"
For this is "growing weather."

It was a farmer's random thought,
It had a simple meaning;
But chords we touch with careless hand,
Will set a dreamer dreaming,
And by the joyous harmony
Of soul and sense together,
The key-note of my mood was touched,
And echoed "growing weather."

Ah! weak and worn must be the heart,
And comfortless the spirit,
That hears, in this sweet growing time,
No "come ye and inherit;"
That ere not drawn to purer hights,
By every lifting mountain,
And catch no whisper of rebuke
From stainless grove and fountain.

Wake ye, who sleep through harvest hours,
Know but the breath of roses;
And these shall teach more generous life,
Before their short day closes.
Expand to some such perfect grace
As sways the meanest willows,
Or curves the pliant symmetry,
Upon the smoothest billows.

So each high noon shall ripen thee
To fair and fruitful splendor,
And all night silences shall fall
Like prisms soft and tender.
So every morn shall bring to thee
Its new divine evangel,
And wave-kissed lilies show less white
Than the record of thine angel.

Grow on and upward, soul of mine;
For thee the Summers tarry;
And sheen and shade, and voice and mould,
Are wrought from Nature's quarry,
That thou upon the farthest hights
Mayst reach sublimer levels,
And find a better joy at last,
Than that wherein she revels.

The Old Farm Gate.

BY EUGENE J. HALL.

The old farm gate hangs, sagging down,
On rusty hinges, bent and brown;
Its latch is gone, and here and there
It shows rude traces of repair.

The old farm gate has seen, each year,
The blossom bloom and disappear;
The bright green leaves of Spring unfold
And turn to Autumn's red and gold.

The children have upon it clung,
And in and out with rapture swung,
When their young hearts were good and pure—
When hope was fair and faith was sure.

Beside that gate have lovers true
Told the story, always new;
Have made their vows; have dreamed of bliss,
And sealed each promise with a kiss.

The old farm gate has opened wide
To welcome home the new-made bride,
When lilacs bloomed and locusts fair
With their sweet fragrance filled the air.

FLOWER STAND.

That gate, with rusty weight and chain,
Has closed upon the solemn train
That bore her lifeless form away,
Upon a dreary Autumn day.

The lichens gray and mosses green
Upon its rotting posts are seen;
Initials, carved with youthful skill,
Long years ago, are on it still.

Yet, dear to me above all things,
By reason of the thoughts it brings,
Is that old gate, now sagging down,
On rusty hinges, bent and brown.

☞ *After* thirty years' experience in seed and gardening business, Briggs Bros., Rochester, N. Y., are about to issue a practical work on the cultivation of flowers and vegetables. The first number of their Floral Work for 1876 is ready. Everyone who cares for plants, as everyone should, should obtain and study such works.

Fair Play for the Farmer.

BY MRS. S. M. SMITH.

On every side new foes arise,
Or old in modern armor,
Ring above ring, like Alps on Alps,
Frown still upon the farmer.

In vain he, single-handed, strives
To cope with powers united,
Or dreams the wrongs of centuries
Will, of themselves, be righted.

What wonder if at last those wrongs
Have roused each man and woman?
What wonder if they learn to use
The weapons of their foemen?

Turn back the enginery of wrong
Again on its possessors;
Yet, God forbid that the oppressed
Become in turn oppressors.

Though a grand army we enlist,
And don defensive armor,
The only conquest we pursue
Is "Fair play for the farmer."

Our ring endangers no man's rights;
No war of plunder wages;
Its influence yet shall bless mankind
Through all the coming ages.

The wisdom that men slowly gain
They lose not in an hour;
It took us centuries to learn
To find in union power.

And centuries of advancing growth
Will yet mark our progression,
Ere sons and daughters of the soil
Forget their dear-bought lesson.

Nor is the lesson yet complete;
Scarcely our feet have entered
Upon the road that leads to hights
Where Toil's full hopes are centered;

Where the starved soul at Wisdom's founts
May be a free partaker,
And the bent form, erect, clear-eyed,
Honor once more its Maker.

City Gardening.

CARE OF TENDER PLANTS.

CITY gardening, to be made successful, requires a good deal more of practical knowledge and care than the majority of persons are aware. We refer especially to the cultivation of flowers and plants on a small scale, in yards, windows and conservatories, in small beds out of doors, in pots, boxes, hanging baskets, etc., in doors and out. There is so much difference in the hardiness of the various plants, the amount of water and light necessary to healthy growth, the susceptibility to changes of temperature and humidity of the air, and the effect of exposure to winds and drafts, that, all things considered, require much attention. Plants which have been grown under the shelter of glass and protected from wind and weather are not able to bear exposure to winds at all. When you purchase of nurserymen for the yard, be sure to get plants that have been inured to the weather, otherwise you cannot make them live and grow in exposed places. Even as hardy a plant as the rose, if grown under glass, cannot endure exposure. We have known beautiful window plants that had been grown under glass to suffer from raising the window and allowing the draft of cold air to strike over them. As many persons purchase such plants for their yards, verandas and windows, a word of caution should be given.

They must not be placed where the wind has a rake at them, nor be exposed to great changes of temperature. They must be tenderly cared for, regularly and plentifully, but not too copiously, watered; that is, they should not be kept continually soaked with water, as is often done by setting pots in pans filled with water. They must be sheltered

from all winds and from very hot sunshine. When the sun is hottest a thin muslin curtain should shelter the plants from its rays. Hanging baskets that are filled with delicate plants should never be hung out under the piazza, where drafts of wind can dash the foliage about. Many beautiful baskets are ruined by such carelessness, and no one need expect success with plants unless they are sheltered from the winds. California is a windy country anyway, and there are more plants annually spoiled by the winds than by all other causes combined. Piazzas where plants are to be grown should have one or both ends enclosed, so as to give the plants shelter. Gardens, when laid out, should be so enclosed that the prevailing winds will be broken, otherwise many plants will perish and none will flourish satisfactorily. This is a matter of much importance—one which we would particularly impress upon the minds of all, as few seem to realize how severely most plants suffer if exposed to winds. Any one who will be careful can be successful in rearing and keeping in beautiful luxuriance any plant they may fancy, if they will but observe a few common sense principles and humor the plants with affectionate consideration for their wants. The really successful and enthusiastic lover and cultivator of plants almost seems to create a bond of sympathy between herself and her pets that amounts to and is, an understanding of what they need, and insures attention to their wants. But there is no more mystery about the business of growing fine plants than there is about growing potatoes. Each plant is adapted to certain conditions, either through its natural habits before cultivated by man, or through the habits it has acquired since man has cultivated it. For instance, we have just stated that as hardy a plant as the rose naturally is, it can be made too tender to endure ordinary out of door treatment by being nurtured in the greenhouse. The same principle will apply to all plants, although there are extremes of tenderness and hardiness beyond which they cannot succeed. The hardy condition tends toward a more stunted, small leaved and closer branching habit, while the tender plant has larger, thinner leaves, softer wood and comes more rapidly to maturity. The thousands of varieties of geraniums, fuschias, verbenas, etc., that have been produced under culture, show how potent is the power of adaptation, when man understandingly works for a given result.

The condition under which a plant may live is not always the condition under which it will become the most attractive. Success in the culture of fine plants means *highest development* as well as healthy growth, although healthy growth is always necessary to perfect deeplopment. There are always certain conditions best suited to development in any given direction. But we will defer further talk about general principles for the present, although there are many important things to be considered.

FROSTY NIGHTS.

The recent frosts have been rather severe on tender plants that were not sheltered. We have noticed that some persons who have left their plants unprotected have thrown water on them in the morning to draw the frost out without its killing the plants, as is the case where the sun strikes upon the frozen plants. If the water is not thrown on until the temperature rises above the freezing point, it will do this, but if put on very early in the morning it will freeze all the harder. The water will turn to ice unless applied every few minutes until the temperature rises. We have known of plants being killed outright by throwing on a dash of water which was allowed to freeze.

It is cheaper to cover plants from the frost than to buy new ones and wait for them to grow. Many grand clusters of calla lilies have been cut down, in San Jose, by frost, through careless neglect.

PLANTING SEEDS.

The surface soil is better adapted to the germination of seeds than that which is thrown up from below by the spade or plow. It should be finely pulverized, whether in beds out of doors or in boxes. "To secure germination, the essentials are a proper degree of moisture, heat and covering. The most usual hindrances are, that the earth dries down beneath the seed after growth has begun, and that a crust, through which the tender sprouts are unable to push their way, forms over the delicate seeds. Hence they should be given a covering that is porous and light, so that it will retain moisture and not bake and form such a crust." The earth upon which the seeds are planted should be settled down by sprinkling, or be slightly pressed down on the surface; then, after dropping the seeds, cover with leaf mould or sawdust and sand mixed, or rotted spent hops, or old manure sifted fine and mixed with sand, or sand mixed with light soil will do. Any covering that will pack down closely and bake when dry is not fit to cover seeds. "Generally, the covering should not be more than eight times the the thickness of the seed, and is best applied by sifting. This covering should be kept moist, but not wet, till the delicate little plants have come through. The moisture is best retained by spreading a newspaper over the surface and keeping it down with sticks or stones for two or three days."

THE illustration this month is of an elegant bronze flower stand. This can be kept in-doors at the window, or be rolled on its easters out upon the porch when the weather is favorable. A stand of this kind, holding a variety of elegant plants and vines, and a glass globe containing gold-fish, is certainly something to be desired, and almost anyone can get or make something like it. A stand of which this is a picture can be seen at Mr. Mitchell's Floral Depot, San Jose.

Land Holder.

PUBLIC LANDS IN CALIFORNIA.

IF men with families who are hunting for something to do would secure for themselves 160 acres of land almost anywhere in the State, they would find something to do for themselves independently, and could easily make a living, while improving their home in comfort and value, with reference to a competence. The man who secures a homestead of land, places himself outside of fluctuations in values and trades. He is not dependent upon others' business and wages, but within his own little holding is a king. There is no way in which a man can more surely secure himself and his family above want. For the information of such persons as are looking out for land we select this article from the San Francisco *Bulletin*. We frequently get letters asking for just such advice:

In this State there are ten land districts, the offices of which are located as follows: Eureka, Shasta, Susanville, Marysville, Sacramento, San Francisco, Visalia, Independence and Los Angeles. In all these offices, or in any of them, the immigrant can find more or less land that is subject to homestead and preemption; and although it is true that the large valley tracts have been taken, yet along the foothills in the mountans it is not difficult for the home seeker to find and locate a 160-acre farm that in the Eastern States would be considered very valuable. There is land to be had in the following counties by the immigrant or home seeker: Kern, Fresno, Tulare, and in the counties of San Diego and Los Angeles, while in the northern part of the State there is much good land. The valleys of this State will raise cereals for the world as well as for a home population. A recent survey made of the La Poresimo Rancho, in Los Angeles county, ten miles from Lompoc, gave to the United States out of this one rancho 20,000 acres of fine farming lands. This was a special survey, made by the United States Surveyor-General's office of this city.

The *Southern Californian*, published at Bakersfield, in Kern county, makes the following statement:

Some of the best lands in Kern County are yet open to settlement. The lands in township 29 s. r. 27 e., township 29 s. r. 26 e., lying west of the river, are mostly very favorably located, and some recent settlers there are constructing a ditch from Kern river. The surveyor has been at work in these townships for many days past, accommodating a number of new families, who have made their way in wagons from the North. There is room for thousands of settlers in these two townships alone. Bakersfield is situated on the east side of Township 29 south, Range 27 east, so that the outer limit of the two townships will be but twelve miles from this place. Portions of sections 18, 25, 30 and 32 have been applied for within a short time past, but according to the testimony of Mr. McCord and Mr. McCaffrey, who have settled there, the lands remaining are equally good, and are well worth the attention of families seeking for good homes. There is a fair supply of timber on each section, and abundant water to be obtained from the river, which runs through the townships.

As a general thing too little effort is given to search for such locations by new comers. It is found more convenient to buy out some settler already established at from ten to twenty dollars per acre. We know of 160-acre farms having been sold for $2,000 by speculating settlers, who have never made the least improvement, and who have managed to secure other claims, within a few miles, at Government price.

We hope this notice will be read only by *bona fide* settlers, to whom we will cheerfully give all the information needed to make locations, which to some extent can be done without the expense of a surveyor.

SOLDIERS' HOMESTEAD CLAIMS.

The matter has been agitated before our State Legislature to petition Congress to prevent any persons from speculating in public lands with soldier homestead warrants. This is a move in the right direction, although late in the day. We would like to see a bill so framed that none but actual settlers can buy Government lands under any consideration, and then only in limited quantities and only when he holds no other lands. Every scheme of land warrants, whether granted to the State, to school funds or what not, has been gotten up by land sharks to be used for their own aggrandizement, and have been so used. It should be made a crime against our country for one person or corporation to attempt to get more than a limited amount of Government lands; and that limit should be placed low enough to allow actual settlers a show for years to come. We are not one to endorse the principle that capitalists should have the right to more land than anybody else. The land should be for the people, sacred to the settler, above the reach of inordinate speculation. Were land monopoly impossible, there would be thousands of homes in California to-day where there are hundreds. The whole community would be better off. Capital would seek investment in industrial channels, and less idleness and distress would naturally result. As it now is, a poor man is virtually fenced out of the country. Before one can get a farm, he must give somebody the savings of from ten to thirty or more years' labor—somebody who has never added one cent to its value in many cases. Quite as often the desirable lands are held to be rented; and the rental, one year with another, would make a hard-working man a poor slave to the landlord.

It is best that some of the terrible evils incorporated into our civilization should be remedied in a civil manner, before an oppressed and long-suffering people become desperate beyond such control. That land monopoly, in all its forms, is one of the most serious matters that our country needs to consider and to correct, we are well, and too well, satisfied. In the patriotic and heroic days of the Roman republic, he was an enemy to his country who desired more land than he himself could use. But the power that conquered the world finally crumbled through land monopoly. The Senate granted away the land and slavery usurped the labor of a once free people. Virtue vanished; men decayed; patriotism perished, and Rome was no more. May such history not repeat itself in our proud land.

RAILROAD GRANTS VS. SETTLERS CLAIMS. —We are glad to notice that Congress is considering the the rights of the settlers who, in several states, have been ousted by railroad grants. Every honest American believes that our pre-emtion laws were intended to protect actual settlers; and that no grant should be allowed to interfere with such rights. It is to be hoped that the settler will yet find protection against schemers of every grade. But as long as greedy capital has the power, and dishonesty rules, there is little use in hoping.

EVERY civilized nation in the world will take part in the Centennial Exposition. The Commission have determined to close it on the Sabbath—that is on Sunday, the Sabbath of the Christians. If they close on the Sabbath of every nation represented there—and why should the nations be shocked in their moral sense by a failure to do so?—it will always be closed. For the Greeks they will close it on Monday; for the Persians on Tuesday; for the Assyrians on Wednesday; for the Egyptians on Thursday; for the Turks, the Arabs, and all Mohammedan nations on Friday; for the Jews and Seventh-day Baptists on Saturday, and for us Christians they will close it on Sunday, and open the beer-garden for us. *Louisville Courier Journal.*

Capital and Labor.

ASSOCIATED CAPITAL AND CO-OPERATIVE LABOR.

BY JOHN D. SCOTT, M. D.

THERE is no real and *bona fide* antagonism between labor and capital, *per se*. When, however, selfishness on the part of capitalists induces them to lessen the wages of their workmen without just cause, or greed on the part of the laborers influences them to indulge in the doubtful luxury of strikes, then there does arise antagonism, often of a fearful character. But these are really foreign and artificial elements. They are not germain to either. As Wordsworth in his inimitable phraseology declares that "the child is father to the man," the one, in process of time, growing naturally out of the other, so capital is but a legitimate evolution out of labor. Capital could never have had an existence without labor. It is the representative, measure and exponent of labor; and there can be no more antagonism between them than between the bunch of grapes and the vine that has produced it. So intimate is this union between capital and labor that, like "the meeting of the waters," they might be said to merge into one another, thus annihilating the idea of antagonism altogether. One is the compliment of the other, and could no more perform its appropriate functions, alone, than could the single blade of a pair of shears when separated from its fellow. They are mutually inter-dependent, not only for their prosperity, but for their very existence. No wrong-doing, therefore, no oppression, no extortion, on the one side, can long exist without entailing on that side the bitter fruits of loss of business, depreciation of values, loss of interest, loss of skillful workmen who seek other and more promising fields of enterprise, and, as often happens, the total breaking up and ruin of all interests concerned. And, on the other hand, through the misguided counsels of trades-unions and unjustifiable strikes, hundreds and thousands of the working classes have been driven to the verge of starvation and plunged into indescribable ruin. These remedies have not only been shown theoretically to be inadequate to the righting of the wrongs complained of, but practically, also; for the history of these unnatural wars teaches us that they have always been disastrous to both parties.

As these remedies have been found worse than useless, it is pertinent to enquire what would be effective ones. We confidently reply, in the first place,

AN INCREASE OF KNOWLEDGE.

Ignorance is not more the mother of superstition than of error; and error leads to innumerable evils. The universality of education, and the consequent diffusion of knowledge, affords to capitalists and laborers the only known means of becoming thoroughly acquainted with themselves and with each other. It is the rising sun that dispels the darkness of the night and the mists of the morning. It teaches the capitalist that money is not the panacea for "all the ills that flesh is heir to," and that it is not the *summum bonum* of human effort; and the laborer, that "man lives not by bread alone." Something more is wanting to complete the sum of human happiness than capital and labor. These may be the means, but not the end of life.

"Life is real, life is earnest,
And the grave is not its goal;
Dust thou art, to dust returnest,
Was not spoken of the soul."

Culture—a higher plane of civilization—the full and complete development of human capabilities and possibilities, should be the goal of human ambition.

We say, in the second place, that when this knowledge has been attained—when capitalists and workmen thoroughly understand each other—their mutual needs, their combined omnipotence for good—

THIS KNOWLEDGE SHOULD BE PUT INTO PRACTICAL USE.

A few hundred years ago, even among Europeans, such a consummation would have been an utter impossibility. They had not yet been educated up to that plane. Even now, such an idea would be as incomprehensible to the Oriental mind as the transit of Venus to a Hottentot. But, thanks to Dickens and Eugene Sue in fiction, Beranger in song, John Bright and Owen in actual practice and Herbert Spencer in social philosophy, and millions of philanthropic pens and open purses everywhere, mankind is beginning to he redeemed and disenthralled from the superstitions and errors of the ages, and rendered capable of conceiving and establishing those grand industrial institutions that are to civilize and crystalize the best instincts and aspirations of humanity. These are the mighty influences that are slowly, but surely, lifting us to a higher level, as continents rise from the sea. We are but just entering upon this grand and glorious

INDUSTRIAL ERA.

Practical expression was given to it in the Paris Exposition; the reverberations were continued in the English Crystal Palace, and now they are echoed back in centennial thunders from the New World to the Old. In the City of Brotherly Love capital and labor will meet once more, face to face. Again will they join hands over the holy altar of civilization, and the heart's pulsations of each will be felt by the other. On that holy ground, consecrated to the best interests of man, will again be demonstrated, in the presence of the assembled world, the great problem of the compatibility of capital and labor. And the world will now acknowledge the justness of the solution, inasmuch as many co-operative manufactories, in various countries, can be pointed to as successful examples of co-operation. Among these, the great carpet manufactory of John Bright will not be forgotten. It will be shown, among other facts, the larger the establishment—within reasonable bounds—the less the general and individual expense, and the greater the combined profit. When the operatives occupy one building their rents will be decreased fifty per cent. The same, or even a greater per cent. can be saved when all the cooking is done in a common kitchen and the meals served in a common dining-room. The waste heat from the cooking ranges could be made to warm the entire establishment, the rooms occupied by the workmen and their families, as well as the various apartments where the work is done. A laundry could do the washing for the entire community at much less cost than it could be done by each family or worker separately. A hospital would accomplish the same saving in the care of the sick. Of course, water-powers, a strip of timbered land, grain fields and pastures, cows, poultry, etc., would all be *desiderata*. Many other acquisitions which will suggest themselves to the reader, but which we have not space here to enumerate, would lessen the expenses and increase the economical workings of the institution.

The great dining-hall could be made to do duty, on occasion, as a concert room, as a theater, for the purposes of a debating society, for the delivery of courses of lectures upon literature, art and science by distinguished scholars, and as a ball room.

As "honor and fame from no condition rise," in a community like this, endowed with the various tastes and talents found in our common humanity, natural musicians, painters, sculptors, inventors, etc., would spring up and have abundant opportunities to develop and perfect their powers. In this age of "the making of many books" a library would only be a question of time. The community could institute its own schools or send their children to the common schools.

It would be a pleasant task to elaborate this article still further and run out these and other lines of thought to their legitimate conclusions. We might advocate the establishment of a newspaper, a savings bank, a life insurance company, and many other institutions in this our busy little world. We might dwell upon the well-known social principle that the bettering of the condition of the working classes, the increase of their education, and the cultivation of their tastes and talents vastly increases their wants and their capacity for enjoying the luxuries of life and the esthetic creations of genius. We might demonstrate that such a community, set down in a dull town, would soon galvanize it into commercial life and ensure a fortune to every one of its enterprising tradesmen. But we must leave the pursuit of these pleasing thoughts to our intelligent readers. Our lengthening lines admonish us that we are trenching upon our prescribed limits, and that we must bring this paper, which we wish we could have made more acceptable, to a speedy close.

But, to make our institution a truly co-operative one, and to insure its success "beyond all lingering of doubt," the working men, women, and children employed, besides reasonable wages, should be allowed a certain per cent. on the net earnings of the institution. The effect would be magical. It would instantly transform a human machine into an interested, self-respecting worker. While working only for wages, the machine cared only to get through the day's work as best he might and draw his wages every Saturday night. But as an interested stockholder—as a part owner—in the vast estate and buzzing machinery, with what different eyes he looks upon the busy little world around him! He sees everything—hears everything. He encourages a despairing comrade here, chides a lazy one there, and reproves careless ones everywhere. The processes of work which he looked upon before with such stolid indifference, he now studies with the keenest relish, and makes vast improvements in the machinery wherever needed; and having liberal inducements offered him in the way of rewards and payments for patents, this interest is hightened an hundred-fold, not only for the benefit of the worker or inventor himself, but for that of the company at large.

Thus the working men, the women, and even the children are raised to the plane of self-respect and self-assertion. The faculties of the mind are not only unfettered but developed to their utmost capacities. The shackles of blighting poverty, with its pinching cold and gnawing hunger, fall from their limbs in broken links, never to be welded and worn again, for "revolutions never go backwards." Instead of having to trudge with long, weary steps to their work, they are on hand, in the same building with it. Their hearts are not weighed down with the bitter dew-drops of sorrow, nor their limbs stiffened by "November's surly blast." They do not go to their work with the last sigh of human dissolution on their lips, but with the cheery carol of the lark as he mounts up to greet the coming morn. Intelligence flashes from every eye, and the roses of health bloom upon every cheek.

Let not, then, the noble band of workers in the holy cause of human progress despair. Let them remember that good seed in the moral world, like that in the physical, reproduces itself, and that its golden harvest will be garnered up, at last, in the great store-houses of "the good time coming." The bread cast upon the streams of industry, like the Egyptian's wheat sown upon the flooded Nile, will return after many days, to feed, to clothe, to educate and to bless millions yet unborn. Thus is the human race to be raised and enabled to fulfill their great mission, "to subdue the earth." Thus will mankind be brought to a perfect comprehension of the laws of mind and matter—the great principles of the religion of science—that are to perfect their characters and bring them in closer harmony with the attributes of Deity.

Educational.

PROFICIENCY WILL COMMAND SUCCESS.

DOUBTLESS a thorough education is something to be desired and worthy of the ambition and exertions of every young man. It is a life-long source of blessing. But to be half learned is ignorance. Education is not simply book-learning. It is somethiug practical. To have the head filled with theory, and lack the ability to apply, is a burden. There is such a thing as being educated to a point of usefulness; but the one who has stopped short of this is truly an object of pity. Be educated mechanics—be understand workmen, and the world will want your services. "Proficiency will command."

In almost any season of the year, in our cities and towns, numbers of men are to be seen who apparently have little or nothing to do. They live in a hand-to-mouth, semi-starvation way; complain loudly of hard times, no work, and gloomy prospects; curse the country and the people, and blame everything except themselves for their lot.

In a country like this, where Nature seems to have exhausted her genius in creating a home for man; where everything conducive to comfort and happiness is all but spontaneous; a country that has but begun to develop it varied resources—it does appear strange, at first thought, that such can be the case, and we are naturally led to inquire, What is the cause of this? What reason can be assigned for it? It results from several very apparent causes. We will now notice but one. Among this class of men are representatives of almost every trade and profession, and although not the only reason, one of the chief causes of their idleness is to be found in the fact that these are generally very inferior workmen. They are men who have not thoroughly mastered their professions before setting out as journeymen. They are not educated mechanics.

This flooding of the market with an inferior and unprofitable class of work-

men ought not to be wondered at; it is but the natural offspring of our loose apprentice system. A boy gets a year or two's experience at a trade or profession and then he is off. There is no more for him to learn. He knows all about it; or, if he does not, he trusts to his "cheek" to help his ignorance over the rough places. No wonder that such men become "tramps." The imposition is too transparent to serve them long in one place, and they must go in quest of other victims. The printing trade furnish a good illustration of this evil. We are frequently visited by specimens of the genus "typo"—our cities swarm with them—who are out of employment. The difficulty in their case is that they spent a few months, perhaps a year, in some office, then conceived the desire for more wages and started. The consequence is they know nothing of their trade, and must travel from place to place. No one wants him the second time. His memory is like the flies in the apothecary's ointment.

The establishment of schools of mechanical arts would remedy this evil to a great extent, if the management of such institutions could be kept from the hands of ambitious and designing men. As this is almost impossible, and the Constitution of the United States will not permit us to adopt the system of apprenticeship followed in other countries, but one way is left to solve this difficulty and secure skillful workmanship. Let employers pay their men wages in proportion to their merits, so that the impostor and the apprentice may understand that skill and proficiency are appreciated and remunerated, while a low grade of workmanship is a barrier to any and all success. Let the quality, and not the quantity of work done, be the basis of remuneration. Encourage the apprentice to make himself master of his profession. Show him that it is to his interest to be competent. We cannot compel boys to remain under our instructions. We must appeal to their intelligence and interests. In this way we think a vast amount of good might be accomplished, while, if we continue in the way our present course is tending, competent tradesmen will soon be a thing of the past.

One word to the boys and young men who are anxious to be tradesmen. There is plenty of room yet in any trade for you. But you must be able to stand in the front ranks. It is crowded below, but there is room enough for you above. Good workmen are in demand, and always will be, but anything less is already two plenty. The market is deluged with counterfeits and ordinaries. Keep to your place as a learner until you are a regular graduate. Strive to excel in whatever you undertake. Let none stand before you. If you are at the plow, be among the best plowmen; if you are a mechanic, be among the first; if a lawyer, a doctor, a minister or a teacher, be one of the tallest. Stand where you will command. Never allow yourself to be satisfied until you are thorough—until you are master of every detail. No willing and competent man need long be unemployed, whatever his calling is. The world needs and demands the highest and fullest development of your talents and capacities, and *is ready to pay for it.* You need have no fears of a proper appreciation and reward for genuine merit; but you have no right to expect a market for any degree of inferiority. Deception may serve you for a time, but eventually it will leave you bewildered and lost. Have in you the elements of worth, and you will be secure. P. F. P.

REFORM NEEDED IN SCHOOL MATTERS.

If there is one single question of political economy that comes right home to the people, it is the matter of public schools, and the support and management of the same. We are encouraged, by the report of the special committee of the State Senate on retrenchment, to believe that the present Legislature of California will be persuaded to do something towards reforming some of the abuses that have been barnacled upon the system. At any rate, it is by exposing evils that people are to become prepared to contest them. We quote parts of the report upon the use of the school fund:

"Your committee believe that here, as in other divisions of the State economy, reform is practicable, and that discontinuance of State aid to the publication of the *Teacher*, and of the application of the school fund to the maintenance of state and county institutes would relieve the people annually from taxes to the amount of forty thousand dollars; and so far as the institutes are concerned, by preventing the demoralization necessarily attendant on the interruption of school exercises, leave them in a more healthy and efficient condition."

Only think of it, $40,000, which should go towards educating our youth, spent to strengthen the ring that supports a lot of still more expensive figureheads. A ring that debars the people from choosing their own teachers, at such reasonable prices as fair competition would be sure to allow. The *Teacher* publication is of no real advantage in an educational point of view; but few outside of the ring ever see it, or care to see it. As to the teachers' institute arrangement, it could be dispensed with without injury to the cause of education, even if to support it cost nothing.

The Senate committee on retrenchment next pitches into the County Superintendents' office as something superfluous:

"Other subjects of questionable utility connected with the administration of the schools have not escaped observation, and it may be a matter of economic consideration to determine whether County Superintendents form any necessary part of the system; whether the duties performed by them are not more ornamental and expensive than useful, and whether the same services, almost without expense, ought not to be imposed on some other officer. These offices cost the people annually $43,622. Should it prove, on examination, that the office is to a sinecure, its abolition would greatly strengthen the fund that should be sacredly dedicated to the education of the growing youth."

That is sensible talk, too. Over $40,000 more of the people's taxes spent for the privilege of having schools graded to suit high-priced teachers who are often given places from motives of favoritism. We would like to see this matter of choosing teachers and the amount of their salaries left entirely with the school districts—brought home as closely to the people themselves, who pay the taxes and have children to educate, as possible. Then the outside school districts that get now only from three to six months schooling in a year, could get at least ten months, and better schools at that. But the way school matters are at present managed the taxpayers and parents of children are nobodies. The whole thing is manipulated for them by high-salaried "consequentids," who care more about sustaining their own pay and dignity, together with that of their favorites, than for the education of children who need educating.

We regret that the State Superintendent of Public Instruction was not included in the list of figure-heads. In our opinion, if there is an office in the State that is of no earthly use, it is the State Superintendent of Public Instruction. The whole business necessary to be done could be better accomplished by the Governor without extra expense to the people. This onasn figure-head upon the school monopoly ringcosts, in annual salary, $3,000 of the school money; and the last report of this official cost only $10,800 more of the money raised to *teach the children.* To send this ponderous burden through the mails over the State cost about $3,000 more, and nobody benefitted but the aforesaid ring.

Our retrenchment committee next touches upon the system of granting teachers certificates:

"Keeping always in remembrance the vast sum that is now needed, and the much greater sum that will soon be required to keep in successful operation this grand institution [public schools], and remembering that the greatest economy should be observed, and that waste here is no more defensible than elsewhere when dealing with public funds, your committee are persuaded that unless radical changes are inaugurated in the system of granting teachers' certificates, it will prove too burdensome for the public purse. The standard for admission to teach in the primary schools is too high. The nature, quality and character of the examination is often unreasonable, if not absurd, and requires a scale of proficiency wholly inapplicable to elementary instruction. The effect is to exclude from teaching a great many persons of experience and capacity, and to prevent competition for places; creates a monopoly of the school house; maintains a high salary for the favored teachers; makes the system unnecessarily expensive, and the rewards one class of industry, by unequal distribution, beyond all others. The spirit of selfishness which surrounds with difficulties any attempt to obtain a teacher's certificate, finds a counterpart in the exclusive privilege accorded the school house to count a lunar a calendar month."

Complaints have frequently been made ,o us, by competent persons, that the granting of certificates is often a matter of favoritism; also, that it is next to impossible to get a position to teach, excepting through the influence of friends. The matter of teachers' salaries is fixed by the ring of functionaries, as is almost everything connected with schools. The grading business is another link to the chain that needs breaking. Honest competition among teachers is shut out. The trustees of school districts are responsible for nothing, and might as well be wooden men for all the power they have as to who shall teach, or at what salaries, or how many months of school in a year the school money apportioned to their districts shall support, etc.

It is the people's privilege to pay taxes, and grumble if they want to, and that is about all. Those who consume the money with high salaries, in preserving the dignities of their important positions, are set up as educators, and the children can get along with what little is left for high-priced, patronizing teachers.

Until the tax payer and the parent demand that these abuses be remedied, it will not be thoroughly done. So long as there is power and pay open to office-seekers, there will be found an abundance of men ready to seek such offices, and to defend them. We believe that there is intelligence and principle enough among the people to comprehend the importance of this question, and to at once demand a complete reform. We hope every club, literary society, and Grange will canvas this subject with reference to bringing about a more economical, just and beneficial condition of educational affairs, for the sake of right and the good of the rising generation.

Household Reading.

UP-COUNTRY LETTERS---NO. 2.

BY RACHEL A. ELY.

To the mountains! Yes, so the doctor orders; and in languid enthusiasm I assent, feeling that anything would be better than this continued sameness. The very wall-paper is tiresome to me, and the never ending noise and confusion of the crowds in the streets coming and going weary me, while the everlasting eagerness and energy of buyers and sellers puzzle me. What a wonderful enigma is life! and what a work we make of it, too! Why not take it a little bit easier, go slower and enjoy more, instead of rushing it through, as they mostly do, making a labor of enjoyment, even? Why, half my lady friends are literally *slaves* to society and fashion, and the men are *slaves* to business and money making, while the children are *slaves* to book-learning; and none but we invalids seem to take a thought of to-morrow and the soul's needs.

Ah, well, I do believe I shall enjoy the fresh mountain air, the blue sky, away from fogs, and smoke, and breath of crowds. Green grass and growing crops, daisies and buttercups (when I am able to gather them), and the kind, motherly housewives, in simple calico, who sing as they churn the yellow cream; the golden-haired children, dressed for comfort, playing under the trees and simply happy, because healthy; the g ntle low of the cows, nipping the green grass; the whistle of the menfolks at work in the fields—all this floats over my vision. And folding my thin hands, I close my eyes and wonder if indeed I shall grow strong in those new scenes, and ever take my place again among the busy throngs, and do anything to help the world along. No one misses me now save the few who attend my daily wants. But would it be the same if I were well and strong once more, active and full of life, helping the poor and needy and encouraging the failing, giving words of counsel to the weak and sickly, who, like myself, are battling against disease and perhaps death for our portion of health and strength? How I wonder if I ever *shall* till so large a field of usefulness, and *know* I should be missed if not there to fill it! Fearing that I never shall has urged me to do my feeble best now, and this is my excuse, dear readers of the Agriculturist, for writing these Up-Country Letters.

GRANDFATHER'S LETTERS---NO. 6.

EVENTS OF THE LAST CENTURY—INGLEWOOD'S REPLY.

Thank you, dear Aunt Mary, for your very candid answer to the questions about which I was so solicitous, and the encouragement you give for the continuance of the correspondence. You must even be of my way of thinking in this matter, viz: that serious subjects can be discussed more coolly and dispassionately

in bone. The breast does well for kitchen dinner nicely stuffed, and is much cheaper than the other joints.

Sirloins and ribs of beef are very extravagant joints from the weight of bone. The roasting side of the round part of the buttock, and the part called the "top side," are the most profitable for family eating. The mouse buttock is used for stewing; shin is used for soup or stewing.

Washing Woolen Blankets.—A lady writing for the *Household* gives her process for washing woolen blankets: For two or three blankets take one pint of soft soap, two tablespoonfuls of powdered borax and dissolve in boiling water. Add the solution to a tub half filled with cold water, and large enough to contain the blankets; let them stand entirely covered by the solution from twelve to twenty-four hours, then squeeze and rub thoroughly, but do not wring them; put in a basket over a tub and let them drain. Rinse in clear cold water and drain twice, then rinse in blue water, drain and hang up to dry. Be sure to use cold water and not wring during the process, then the blankets will not shrink, but will dry white and smooth.

Favorite Bread Pudding.—One pint of bread crumbs; one quart of rich sweet milk; beaten yolks of four eggs; stir all together and bake in a moderately hot oven till done. Add one heaping teaspoonful of white sugar to the whites of the eggs; beat to a froth; turn it over the pudding and return to the oven to brown slightly. To be eaten with cream and sugar, or pudding sauce, if desired. If wished very nice, a little currant or other jelly may be placed on the top of each dish as it is served at table.

To ruin oil-cloths, clean them with hot water or soap-suds, and leave them half wiped, and they will look very bright while wet, and very dingy and dirty when dry, and soon crack and peel off. But if you wish to preserve them, and have them to look new and nice, wash them with soft flannel and luke-warm water, and wipe thoroughly dry. If you want them to look extra nice after they are dry, drop a few tablespoonfuls of milk over them, and rub them with a small cloth.—*Rural Home.*

Spectacle Wipers.—These are easy presents, and nice ones. You must cut out of soft chamois leather, two perfectly round pieces an inch and a half across, and bind the edges neatly with narrow ribbon of any color you like. Fasten the circles together at the side with a small bow. This is all, but you will find that grandpapa will like it very much. It takes almost no room in his pocket, and is always at hand when he wishes to wipe his glasses, which he is sure to do several times a day.

A little fellow, who was at a neighbor's house about noon the other day, watched the preparations for dinner with great interest, but when asked to stay and eat something he promptly refused. "Why yes Johnny, you had better stay," said the lady; "why can't you?" "Well 'cause," said the little fellow, "ma said I mustn't unless you ask me three times." They invited him twice more right off.

The shortest way the best—Mamma (to Ethel, on their waw to the latter's first party) "Now, mind, darling, if you see any nice things on the table that you'd like to eat, you mustn't ask for them." Ethel—"O, no, mamma!—I'll take them."—*Punch*

box. I like it fully as well as bath-brick.

We have been papering the house, and have found what we consider an improvement on the old plan of dipping the strips of cloth into the paste. We put the paste, with a brush, on the boards, then put the strip on dry and run the paste-brush over it once or twice, and it lays down smooth with no trouble of unrolling the edges. We put on newspapers between the wall-paper and the boards in the same manner.

Looking over an old number of the Agriculturist, I saw an article in which the writer advocated grafting or budding lemon trees with orange cions, giving as a reason that the trees will bear two or three years sooner than without grafting. We would like to hear from those who have tried this method of bringing their trees into earlier bearing. Which is the safer, to graft or bud—and when? How old should the lemon trees be from the seed?

PLAIN CAKE.

One cup of sugar, two eggs, one and a half cups of flour, two tablespoonfuls of butter, grated rind and juice of one lemon, one teaspoonful of soda, two of cream of tartar, four tablespoonfuls of sweet milk.

CREAM CAKE.

One cup of sour cream, two cups of flour, one cup of sugar, one teaspoonful soda, one egg. Flavor with vanilla.

Will some of my sister house-keepers give me a receipt for lemon pies?

NOTES FROM CORRESPONDENTS

Editor Agriculturist: I noticed in your January number "A Devoted Subscriber" inquiring how to wash colored flannels so as to have them soft and bright. I never have any trouble, and this is how I do mine: I use suds that is almost cold, rubbing them immediately upon putting in the water, and rinsing in perfectly cold water, hanging them wrong side out in a good, airy place to dry quickly. If the sun is not very hot I hang them in it, but in Summer I prefer the shade. Some put a few drops of sulphuric acid in the suds, but I do not, fearing it would rot them.

Yours, L. P.

Mr. Editor: Can any of your lady readers tell me how to make mushroom catsup? I am very anxions to know how, as it is very nice. An Inquirer.

Dear Editor Agriculturist: Will not some of your young lady readers tell me how to make those pretty, coral fancy ornaments out of grape-vine branches and egg shells? I saw one the other day, and would so like to make some.

Alice.

Selected Recipes, Etc.

Hints About Meat.—Pepper is a preventive of decay in a degree; it is well, therefore, to pepper hung joints.

Powdered charcoal is still more remarkable in its effect. It will not only keep the meat over which it is sprinkled good, but will remove the taint from already decayed flesh.

A piece of charcoal boiled in the water with "high" meat or fowls, will render it or them quite sweet. A piece of charcoal or powdered charcoal should be kept in every larder. Hams, after being smoked, may be kept for any length of time packed in powdered charcoal.

The leg of mutton is the most profitable joint, containing most solid meat. The neck is the most extravagant joint, half the weight consisting of bone and fat. The shoulder has also much waste

health. These, going hand in hand, each promotes, or should promote, the other. But what is the best health in all these departments, without companionship? This may be most observable in childhood. A child suddenly comes on some new object of interest—a flower, a new one it greatly admires. Is that child content to admire it alone? No; it is plucked to carry to her companion—her mother, perhaps, whose mutual admiration doubles her own joy. If that mother turns from the flower in disgust, it disappoints and dampens the ardor of that child's joy. So, in the intellectual, moral and spiritual, we may have lonesome joy; but how is it enhanced by congenial, suitable, sympathizing companionship!

Such, dear Aunt Mary, is Inglewood's reply to a portion of your letter. Will it elicit a reponse from any member of your family circle? Very truly,

Inglewood.

Men as Lovers.—In the first place, it is an imposition on any well-bred girl to keep her up later than half-past ten o'clock, when you have the opportunity of seeing her often. If you always leave her with the wish in her heart that you had stayed longer, you gain so much. Never run the risk of wearying her with your presence. Be just as earnest and straightforward as in your honorable dealing with men. Impress your friends with the worthiness and seriousness of your love, so that vulgar and senseless bantering will appear to them as such. Love is religion—the supremest happiness, wear it manfully and proudly, but nobly. Woo a woman bravely. If there is anything humiliating to a woman, it is to have a lover, whom she wishes to honor, weak and vapid, ever yielding and half afraid of her. She longs to tell him to "act like a man." The man who conceals or denies his love for fear of being laughed at, is a coward. A love that has no element of divinity in it is not love, but passion, which, of itself, has nothing enobling. That was a beautiful inscription on an engagement ring, "Each for the other, and both for God."—*Miss Abbie Terry.*

Domestic.

FAMILIAR TALKS---No. 6.

BY SNIP.

My deaf "Busy Bee," do not think me ungrateful for the advice about my chickens. Owing to the late receipt of the Agriculturist, a portion of my letter for January was written before I had the pleasure of reading your letter. So far as I have put "Busy Bee's" suggestions into practice, the result is satisfactory.

I had my attention called, the other day, to a rather novel article used for scouring knives. The materials required are a piece of board about four or five inches wide and about as long as a knife blade, and a piece of heavy carpet as wide as the board and twice as long. One half the carpet, lengthwise, is nailed to the board, the other half being left loose. The brick-dust is placed on the carpet, the knife is placed on it, the other piece laid on the knife and held with the hand while the knife is drawn in and out. Apparently, the work is done easier and quicker than by the old method of using a rag and brick-dust. For some time past I have been using the sand that falls from the grind-stone into the water-with the pen than *viva voce*. More apt are we to make slips of the tongue which cannot be recalled, than we are of the pen; so I cheerfully accede to your suggestion as to what are my views of that ulterior object I may have in view—matrimony; also, as to those sterling masculine qualities, equally essential as the feminine ones on the other side.

More than a quarter of a century ago I remember to have heard man, and woman too, in a single state, compared to the separate halves of a pair of scissors. True, they can exist and not wear out any quicker in this separate condition; but these halves, when brought together in a perfect match and fit—how nicely they do their work! what useful instruments they are! Though this is a very poor analogy, it seems to show the incompleteness of man alone; that there is something more wanting; a yearning for companionship in all the departments of our nature, from the physical up to the very highest—the spiritual. As in the scissors comparison there must be adaptability, a fitness of parts, just so in the other case—in the physical conditions and circumstances; in the intellectual, tastes and sentiments; in the moral, right and wrong; in the spiritual, hopes, expectations and aspirations; and what are all these, wandering through life's dreary path alone, as compared with what they are in congenial, suitable companionship, by one's own fireside?

Such, dear Aunt Mary, is the companionship I am hunting for; and for life's results in this direction I assure you I feel no little responsibility, extending even into the next world. Under one or other of these departments of our nature are to be found those sterling masculine qualities of our nature (and feminine qualities, also), that in conjunction are so promotive of happiness. To reply to your inquiries with equal candor and frankness with your own good letter, I begin with the physical conditions and circumstances. Here it is for you to judge how my choice coincides with my principles. My principle is, that man being the chooser, having the wide world before him, being the more positive agent, on him must rest by far the greater responsibility; and that it is only by promoting the happiness of her whom he takes to his bosom that he promotes his own. Therefore, I have to ask myself how far and to what extent arc the darling Angie's condition and circumstances to be altered by the changes in homes I propose for her. A country life, as she has been accustomed to, and the interior department consigned wholly to her care, I may hope in time that it may conform wholly to her wishes. She will have to trust to my love, my honor and efforts for *my* endeavor to make it so; but mainly to the first of these, for if that abounds the others flow forth spontaneously. Of Angie's sterling feminine qualities I am well convinced, for I have been a close observer, and it now remains for Aunt Mary, dear Ma and the beloved Angie herself to scrutinize the qualities of Inglewood on the other side and from the same standpoint; and I may hope to be allowed they should have the opportunity to do so. I claim for him to be free from a love of club-room pleasures, and all those of a more sensual nature, that lead men from the love of and study of the welfare of their families to mere selfish gratification. I know, too, how he appreciates physical health as of the very utmost importance; that neither man nor woman should enter the sacred precincts of matrimony without it; and how it is best promoted by being joined with intellectual, moral and spiritual

Women.

Going Away.

And so you'll soon be going away,
My darling little Bess;
And so you ha' been to the store to-day
To buy your wedding dress.

And so your dear good mother and I,
Whose love you long have known,
Must lay the light of your presence by,
And walk the road alone.

So come along with your mother an' me,
To the porch for an hour or two,
And sit on your old father's knee,
The same as you used to do;

For we who ha' loved you many a year,
And clung to you, strong and true,
Since we've had the young professor here
Ha' not had much of you.

But lovers be lovers while earth endures,
For once on a time, be it known,
I helped a girl with eyes like yours
Construct a home of our own.

And we laid it out in the garden spot,
And dwelt in the midst of flowers,
Till we found the world was a good-sized lot,
And most of it wasn't ours.

You're heavier, girl, than when you come
To us one cloudy day,
And seemed to feel so little at home
We feared you wouldn't stay.

Till I knew the danger was passed, because
You struck so mortal a track,
And got so independent and cross
God never would let you back.

But who would ever ha' had the whim,
When you lay in my arms and cried,
You'd sometime sit here, pretty and prim,
A waitin' to be a bride?

But lovers be lovers while earth goes on,
And always will be, I ween,
But if you would keep the heart you've won,
Remember what you've been taught.

Look first that your wedded lives be true,
With naught from each other spart;
For the flowers of true love never grew
In the soil of a faithless heart.

Look next that the buds of health shall rest
Their blossoms upon your cheek:
For life and love are a burden at best,
If the body be sick and weak.

Look next that your kitchen fire be bright,
That your hands be neat and skilled;
For the love of a man oft takes its flight,
If his stomach is not well filled.

Look next that money is fairly earned,
Ere ever it be spent,
For comfort and love, however turned,
Will ne'er pay ten per cent.

And next, the care and diligence keep
That the mind be trained and fed;
For blessings ever look shabby and cheap
That light an empty head.

And if it should please the gracious God
That children to you belong,
Remember, my child, and spare the rod
Till you've taught them right and wrong.

And show 'em that though this life's a start
For the better world, no doubt,
Yet earth an' heaven ain't far apart
As some good folks make out.

—[Will J. Carleton.

WOMAN'S WORK --- CONGRATULATIONS.

EDITOR AGRICULTURIST:—Will you permit a few words of greeting from a stranger? Not entirely a stranger, but it is only within a short time that the AGRICULTURIST has come under our observation, and upon the coming out of your January number, we were strongly moved to send you our congratulations upon its new dress and improved appearance. Having a fine corps of able contributors, with its increased beauty and attractiveness, it must continue to grow and develop to full perfection. It has not now a peer among first-class and impartial journals.

I am told, Sir Editor, that this beautiful design and ingenuity of construction of the AGRICULTURIST's present attire is a woman's work. If it is so, we are proud of it. Nothing so satisfies us for being a woman as to know and see what useful, beautiful and grand things women have done and can do. We honor our own sex more and more every time we hear of a woman's having done, or attempted to do anything that ennobles and endows her with the qualifications for advancing humanity's interests, making the world better for her having lived in it. Whether every undertaking is a success or not doesn't matter; effort only proves the ability, as a sex, to do, to be, and eventually to compel the world's recognition and appreciative plaudits of power and of worth.

But what we wished to say was this: that you, with your generous recognition of feminine ability, and sympathy with its present position socially and intellectually, will not omit to give this work its full meed of praise and justice. We are sure you will not, for you know, dear sir, that as the matter stands to-day women get but very little share of praise or encouragement for what they do, try to do, or for what they in reality accomplish. Masculinity (God bless the men, anyhow) gets the lion's share of the credit for even women's labor and achievement, in this nineteenth century. We venture to say, however, that a large proportion of all the elegancies of design and execution, in almost every line and province of human labor and success, if it could be found out, is traceable to the busy, aching brain, the toiling, weary fingers of women behind the scenes. And to think of it! so much—oh, so much of the beauty, grace and perfection of the artistic, so much of the utility of the useful, which will be exhibited at Philadelphia, has received enough of woman's best thought and best work to forever immortalize us as artisans of handicraft; and wrought, too, by women of the deepest obscurity, the severest toil, the most abject and complete social and mental enslavement.

But as a sex, we will yield the point gracefully and prettily, as we can now, fully confident that when the American nation shall have another *Centennial*, woman will then come, not in the rear but in the van, standing where she should have stood, not only 100 years ago but from the beginning of Time. Therefore, as we women cannot, and would not if we could, do without the men, we will still continue to humor their peculiarities and whims, because we sincerely believe that if ever they do come to their senses their reparation will be so full and complete that they will be in danger of erring as far the other way, to wit: of doing us, in degree, as much too much honor as now they do us too little.

Your pardon, sir, for want of brevity. We did not contemplate this tirade in the beginning; indeed, we had nothing to say, except to tell you how nicely your new paper looked, and also how glad we are to know that women designed and engraved its title page. And now, if this should not prove objectionable, we may, with your permission, have something further to say about our sex, together with matters and things in general. C. H. D.

SAN JOSE.

ORANGES NEAR SONOMA.—The *Democrat* says that General Vallejo has 200 flourishing orange trees. 100 of them are in full bearing. As many as 600 oranges have been taken from one tree. He has, perhaps, the largest number of pomegranate trees in any one place in the State—fifty bearing trees. He has a full grown magnolia and a banana tree.

Correspondence.

"DEEP PLOWING" REPLIES.

EDITOR AGRICULTURIST:—Permit me to reply briefly to Mr. Burrell's *critique* on "deep plowing." He starts out with saying that mountain lands will not admit of deep plowing. That may be so, but I dare affirm that but few, if any, have tried it; so that is merely a matter of opinion, and is a mere evasion of my facts. His next statement is, that the wheat plant has no tap-root, and characterizes my statement as mere "assertion." I am sorry to find any one professing to be a farmer capable of making such a statement, which is its own refutation. This denial is so simple and explicit as to be unpardonable. Any farmer can satisfy himself as to the tendency of the wheat plant under the differing conditions of deep and shallow plowing. Four years ago I deeply plowed part of a field one mile from San Jose, that had been consecutively cropped for ten years, and was thought to be worn out. It had never been plowed more than three inches deep before. It is a fine sandy loam and suffers considerable from drouth. I handled the soil strictly according to my experience. I had a *hobby*—thoroughly pulverizing the soil and then consolidating with a heavy roller after the grain was up. On the part deeply plowed I had as heavy a crop as the first that was ever raised upon it. On the part plowed about three inches deep, I had about eight sacks to the acre. So much for *facts*.

This is but one instance among many with the same results. It is a little amusing how your correspondent instances his "garden" and "grape patch" in which he experimented with deep culture, as an offset to my facts about deep plowing. I have no doubt that any one can spoil a garden patch of virgin soil, as his must have been twenty years ago, by trenching it two feet deep. It must have been a curious "hobby," that stimulated our friend to such untimely and excessive digging. But I was not writing about a garden or grape patch. I ventured a few thoughts to practical farmers—to men who can discriminate between a garden patch of virgin soil and an exhausted wheat field; and I stated facts which cannot be controverted. I have tested this thing so thoroughly, with the assistance and in the presence of the best advised and most scientific farmers, and under differing conditions of soil and climate, and do not know of a single instance where deep plowing on exhausted lands, followed with the culture I insisted on in my December article, has not been productive of the most satisfactory results; and when shallow plowing has been a total failure alongside of it.

NEW AGRICULTURAL PATENTS.

Issued by the United States Patent Office from Dec. 19th, to Jan. 14th.

[Reported for the CALIFORNIA AGRICULTURIST by Louis Bagger & Co., Solicitors of Patents, Washington, D. C.]

Rotary Spade Cultivators, D W Brodnex, Sr., Rockdale, Texas.
Mowing Machines, Wm C Douthett, Springdale, Pa.
Check Row Planters, Wm H Johnson, Farmer City, Illinois.
Bee-Hives, Elvin Armstrong, Jerseyville, Illinois.
Processes of Preparing Preserved Fruit, Jno F Bosford, New York, N. Y.
Grain Conveyer Shaft, Henry I Chase, Peoria, Illinois.
Fences, Wm A Couch, Hannibel, Nevada.
Corn Planters, Conrad Gruemer, Dale, Wis.
Plowing and Seeding Machines, D McVaw, Gallisin, Texas.
Plows, Joseph Philips, Smithton, Illinois.
Butter Carriers, B F Roberts, Bennington, Vermont.
Gang Plows, Timothy M Shaw, Lebanon, Tennessee.
Hay Loaders, Chas M Young, Meadville, Pa.
Sway Bar Guides for Harvesters, W R Baker, Chicago, Illinois.
Grain Separators, D H Caswell, Nashville, Tennessee.
Seed Planters and Fertilizer Distributers, M P Curlee, Corinth, Miss.
Fences, Jno Dwyer, Marion, Ohio.
Hand Seed Planters, Thos J Hubbell, Napa City, Cal.
Reciprocating Churns, Wm McKinley, Bellaire, Ohio.
Cultivators, E B Moore, Bell's Mills, Ala.
Feeding Belts and Partitions for Corn Shellers, Wm B Quarton, Freeman, Ohio.
Corn Drill, Jno R Rude, Liberty, Ind.
Grain Separators, C F Butterfield, Garden City, Kansas.
Adjustable Locks and Dogs for Hay Elevators, J R Fitshons, Centre Hall, Pa.
Grain Meters, B M Sulliam, Tolmo, Ill.
Reel Rakes for Harvesters, R C Taylor, Brockport, N Y.
Milk Coolers and Heaters, M L Bush, Huntington, Ind.
Self Rakes for Reaper, S B Gillsland, Salisbury, Mo.
Corn Husking Implements, H W Hill, Decatur, Ill.
Plows, Henry H Habley, Central Manor, Pa.
Manufacture of Grian Cradle Fingers, C P Kelsey, Richmondville, N Y.
Grain Separators, L Theobald, Plainwell, Michigan
Churn Dashers, Jno R Underwood, Nelsonville, Ohio.
Wheel Harrows, F Bramer, Little Falls, N. Y.
Churn Dashers, R M Case, Auburn, N Y.
Plows, N G Pinney, New Hudson, Mich.
Combined Reels and Rakes for Harvesters, H Sales, Philadelphia, Pa.
Hooks for Harrows, J D Tracy, Sterling, Illinois.
Plows, Jno Worrell, Clayton, Ind.
Bee Hives, Daniel Cox, Kingston, Mo.
Convertible Revolving Harrows, Benj G Devoe, Kenton, Ohio.
Milk Coolers, M D Ferguson, Carthage, New York.
Grain Separators, Lewis W Hasselman, Indianapolis, Ind.
Potato Diggers, Robert Heydemann, Krebsow, Prussia.
Clover Separators, Geo F Metzger, West Fayette, N. Y.
Milk Coolers, Isaac H Wonzer, Elgin, Ill.
Churns, Daniel McCarty, Croppers' Depot, Kentucky.
Apparatus for Storing and Preserving Grain, Baas P C Lassen, Chicago, Ill.
Gang Plows, J K McCormick, Georgetown, Texas.
Corn Stalk Knives, Peter C Moore, La Fayette, Ohio.
Portible Fences, Isaiah W Pancoast, Libertyville, Iowa.
Drag rake Handles, Hugh Smith, Passumsic, Vermont.
Portable Fences, Horace Tell, Bristol, Md.
Churns, James Watson, Port Colborne, Canada.
Stump Extractors, J A Hart, Tionesta, Pa.
Horse Rakes, Chas B Perkins, Kenduskeag, Maine.
Cultivators, Joshua Pierpont, Bushnell, Ill.
Horse Rakes, Wm C Raynor, Milwaukee, Wisconsin.
Sulky Plows, H Richardson, Janesville, Wis.
Plows, Jno Sewell, Bowdon, Georgia.
Drills and Fertilizer Distributers, Aladun Wishart, Lumberton, N C.
Grain Binders, J F Appleby, Beloit, Wis.
Plows, Asa Hall, Rockford, Ill.
Farm Gates, Wm J Hollis, DeWitt, Mo.
Fruit Pickers, John Mooney, Providence, Rhode Island.
Hay Loaders, Geo E Peck, Geneva, Illinois.
Seed Separators, Jno L Catchpole, Framsden, Great Britain.
Cultivators, Joseph W Case, Middleport, Ohio.
Straw Cutters, John Grimm, St Louis, Mo.
Yielding Teeth for Seeders and Cultivators, C P Hewitt, Kingston, Wis.
Land Rollers and Markers, James M Hunter, Chariton, Iowa.
Steam Plows, Benj S Benson, Baltimore, Md
Cider Presses, L O Rockwood, Ottawa, Ill.,
Potato Bug Destroyers, Isaac W Griscom Woodbury, N J.

Boys and Girls.

Ten Little Country Boys.

Ten little country boys
Underneath a vine,
A darning-needle frigutened one
And then there were but nine.

Nine little country boys
Swinging on a gate,
One turned a summersault
And then there were but eight.

Eight little country boys
Learning about heaven,
One fell fast asleep
And then there were but seven.

Seven little country boys
Full of monkey tricks,
One rolled down the hill
And then there were but six.

Six little country boys
Going to rob a hive,
A bumblebee stung one
And then there were but five.

Five little country boys
Asking for some more,
One burnt his little self
And then there were but four.

Four little country boys
Climbing up a tree,
The farmer came and whipped one
And then there were but three.

Three little country boys
Gaily dressed in blue,
One tumbled overboard
And then there were but two.

Two little country boys
Both named John,
One knocked the other down
And then there was but one.

One little country boy
Living for a penny,
A little fish swallowed him
And then there wasn't any.

—[St. Nicholas.

Expectations.

Every little grape, dear, that clings unto a vine,
Expects some day to ripen its little fruit so fine;
Every little girl, I think, expects in time to be
Exactly like her own mamma—as grand, as sweet, as free;
Every little boy, who has a pocket of his own,
Expects to be the biggest man the world has ever known;
Every little baby-wig that makes its little wail,
Expects to be a great big pig, with a very curly tail;
Every little lambkin, too, that frisks upon the green,
Expects to be the finest sheep that ever yet was seen;
Every little baby colt expects to be a horse;
Every little pup expects to be a dog, of course.
Every little kitten pet, so tender and so nice,
Expects to be a grown-up cat and live on rats and mice;
Every little fluffy chick, in downy yellow dress,
Expects some day to crow and strut or cackle at its best:
Every little baby bird that peeps from out its nest
Expects some day to cross the sky from glowing East to West:—
Now every hope I've mentioned here will bring its sure event,
Provided nothing happens, dear, to hinder or prevent.

—[St. Nicholas.

"NELL VAN'S" TALKS TO THE CHILDREN.

ABOUT THE USE OF SUGAR.

ALL of you little folks are fond of sugar, I dare say, and many a hard cry has been quieted by a lump of nice, crisp white sugar. It is so comforting, when one feels out of sorts, to have a sweet morsel to roll under one's tongue. A drop of essence of lemon on a lump of sugar tastes almost like lemon candy, while the essence of vanilla, dropped on sugar, is like ice cream, only not as cold. Some people think sugar is not good for children, and we all agree that too much sugar takes away the appetite for other food and causes a craving for sour things. Now, we cannot live on sugar and be well. I once heard an anecdote of a colony of people who had eaten up all their stores of flour and other things, and were reduced to nothing but sugar. They lived upon it for quite a while, and when help came to them they were found greatly reduced in strength, and their complexions were singularly transparent; which shows us that sugar does not contain sufficient nutriment to support life. Extreme indulgence in the appetite for any one thing is intemperance, as temperance is, or rightly should be, defined—the moderate use of anything which is injurious if indulged in to excess.

Eating too much sugar causes an acid to form in the stomach by fermentation, which sends forth fumes through the throat and mouth that affect the teeth, causing their early decay. Children don't like to have the toothache, I know, and a disordered stomach is sure to affect the teeth. Food gets lodged between the teeth while eating, and if not picked out with a broom splinter, or brushed out of the mouth with cold water, the walls of the teeth, which are of fine enamel, become softened and decay, letting in the air to the nerve and causing intense pain. Therefore, children with decayed teeth complain when sugar or acid is taken into the mouth. Keep your teeth clean and your stomachs healthy if you would avoid suffering.

But there is another use for sugar which I would like every child to know. When any of you catch cold in the head, and have your nose stopped up so that you can scarcely breathe except through your mouth, do you go straightway for a teaspoon of fine, pulverized white sugar, and snuff as much as you can, or take a pinch of it between your little thumb and finger and press it up into the nostrils; then lie down or hold the head back so that it can penetrate through the stoppage. Presently the passage will be thawed out, and after using your handkerchief your nose will be relieved of its disagreeable condition. What little boy or girl likes to go to table when the nose is so stopped up that it is impossible to eat comfortably, to say nothing of the peculiar way of pronouncing words which commence with the letter *m*. For instance, mamma says, "John, what is the matter with you this morning?" and he replies, "nothidg is the batter with be, ba'am." She replies, "I should say there was, when you pronounce your words so badly. You talk about 'batter,' and 'be,' and 'ba'am.' Why do you not talk so that you can be understood? It reminds me of the young man who went to serenade his lady-love, and had such a bad cold in his head from being out in the night air, that he sang that pretty song like this:

"'Cub, oh, cub with be,
The bood is beabidg,' etc."

Now, if I had been John's mother, I should have given him a spoonful of sugar snuff, and sent him in the other room to clear out his head to relieve him. I know a mamma that used to put sugar snuff up baby's nose when it had the snuffles, and you don't know how soon the little thing could breathe freely. Yes, children, sugar is a most excellent thing to have in the house, and if it were not good for anything else, it would be indispensable in every family for snuff. Don't forget this; but try it the first time you get a cold, and see if what I tell you is true.

GRANDMA'S TALKS---EASY LESSONS FROM NATURE---NO. 2.

Well, children, here we are again, a little earlier this month than last. Grandma will talk to you this time about Nature, or the things which surround us on the earth. Johnny tells me that he learned, from last month's talk, that everything was either solid or fluid. Lucy (who is quite a little girl) explains the difference between the two in this way: "Solid things we can take hold of and pile up, but fluids run all over, unless we keep them in bottles or such things." Is that a good explanation, do you think? Johnny laughs at it, and says that dogs, cats and chickens would run all over if we tried to pile them up, and asks Lucy if they are fluids. Grandpa tells Johnny that perhaps it is the fluid in them that makes them run so fast. But Lucy thinks our serious talk ought not to be interrupted by fun, and Johnny knows she is not talking about live creatures, but only *things*.

Did you ever think that there is not a place on the earth where there is *nothing*? Here is a box which I open, and Johnny and Lucy both call it empty; but it is quite full of something—what is it? What do we breathe? Johnny did not know that the air is anything, but yet he knew if it was taken away from him, only for a few minutes, he would die. Do you see or feel the air? When I move this fan Lucy says she feels it, and I am sure we can all see it by looking up to the clear sky. Children, will you look at it and see what a beautiful color it is? Is the air a solid or a fluid? Can you pile it up or take hold of it, or does it "run all over" as Lucy says a fluid does? Johnny thinks the air does run all over, because it seems to be everywhere, and he can't push it away. Then it must be a fluid which we are living in, just as the fishes do in water. Lucy laughs at that idea, but isn't it true? Hark! hear the whistle of the locomotive as the cars go whizzing by towards San Jose. What is it makes such a noise? You say, Johnny, that it is made by steam instead of wind: now, what is steam? Lucy says it is something that is made by water boiling; she has seen it come from the spout of the tea-kettle, and if we let it boil long enough, there will be no water left in the kettle. If that is true, then water takes two different fluid forms—liquid and air, or steam, which disappears in the air. Did any of you ever see solid water? Lucy thinks Grandma is making fun now, but Johnny remembers that he saw ice in town and snow on the mountains. These are both solid, yet turn to water when held in the hand. So, then, water is sometimes *solid*, sometimes *liquid* and sometimes *air*. Next time you shall try and tell me what causes water to change its form, for certainly you all know.

HOW GEORGIE'S TEN CENT DOLL WAS CHANGED INTO A PAIR OF SLIPPERS.

BY HELENA.

Georgie is a little girl who lives in San Jose. Last year, during Fair time, there was a tent all decked out with bright colors, where flying horses for children to ride revolved round and round, stopping when the riders wished to dismount for others to take their places for a ride. As Georgie and her mamma were passing by, the little girl begged to stop and take a ride on the pretty wooden horses with side-saddles on.

Her mamma gave her ten cents and said: "Now, my dear, which would you rather have—a ride on one of those flying horses, or a ten cent doll which will amuse you for hours and days?"

The child thought for a moment and then said: "Oh, Mamma, I believe I'd rather have a ten cents doll."

"Very well," said her mamma; so they passed on to a toy store, and there bought, with the ten cents, a pretty doll. Day after day Georgie found much joy in her "ten cents doll," as she called it; and as the little girls in the neighborhood made dresses and aprons for it, she played go to the dressmaker's and then out calling, as grown folks do.

After a time Georgie went to San Francisco for a visit to her aunt and cousins. Of course the "ten cents doll" went along in Georgie's trunk. Once when she had gone to Oakland to spend the day her little baby cousin found the doll, which had been left at home, and played with it till both feet and one arm came off. When she came back and found what baby had done, her aunt gave her another ten cents to buy a new doll, because baby had broken hers.

"Thank you, Aunty dear," said the happy child; then turning to the baby she said, "now the broken dolly's yours and this ten cents is mine." So, going down town with her other cousin, she asked her to keep the ten cents for her till she wanted it.

Something new happened every day, so the doll was forgotten; and the day she started off on the steamer with Cousin Ben the doll had never been bought and her cousin had spent the ten cents, so she gave Georgie a bright quarter instead. Georgie accepted with many thanks, and entrusted to Cousin Ben's care. They were going to Santa Cruz, where her mamma had gone for a visit, and the bright quarter was spent for oranges to eat on the trip.

"Now, Georgie," said good Cousin Ben, "which would you rather have—a quarter or thirty cents?"

"Oh, I'd rather have thirty cents, of course," said she; which quite surprised the young man to find so young a child knowing the value of money. When they reached Santa Cruz and he found he had not the exact change, he threw out upon the table a half dollar and said:

"Here, Georgie, is your money; that's near enough, I think."

"Oh, it's more, Cousin Ben; you told me thirty cents and here's fifty—twenty cents too much. Am I to have it? Oh, goody! Thank you, sir. See, Mamma, what my ten cents doll has grown into!" Then begging her mamma to keep it till she wanted to spend it, the money was slipped into Mamma's purse.

One day when Georgie had nothing to do, she asked for her money to go and buy something. Her mother took from her purse the half dollar and a quarter, saying, "see, now, Georgie, how your ten cents has grown since it came into my possession! Now let's see what you can buy with it."

Delighted beyond expression, the child danced off down town alone to spend it. Candy or fruit she would not buy because they wouldn't last, and even dolls got broken; so, in passing a shoe store, she saw a lovely pair of slippers in the window. She stepped in and inquired the price. They were a dollar, the man said; but when he saw the disappointed look of the child as she turned the money over in her hand and started to go, he said, good-naturedly. "Well, Miss, you may take them along for 75 cents, this time."

Thanking him kindly, she hastened to lay the parcel in Mamma's lap, saying: "See the pretty new slippers I have bought with my own money."

Everybody laughed when the story was told over, and all agreed that Georgie was a most fortunate child to be able to have a ten cent doll changed into a pair of slippers.

Vegetable Garden.

TIMELY SUGGESTIONS.

VEGETABLE gardens, on farms where land is plenty and persons cannot devote as much time to them as the professional gardener does, can be economically carried on by allowing more space between the rows, so as to admit the cultivator to do a good deal of the work of weeding. Weeds are the greatest enemies to be contended with, and it will not do to allow them to grow amongst the plants, rob them of nutriment and crowd them for room in which to freely grow. The farmer who starts a vegetable garden will be likely to get discouraged if he doesn't like to pull weeds from among the tender young plants, and to use the hoe vigorously and often. It will not do to give the weeds the least advantage. They must be gotten rid of. A good way to plant carrots, beets, turnips, parsnips, etc., is to plant in double rows; that is, two rows eight inches apart, and three feet between the double rows, so that a horse cultivator can run in the wide spaces, and the hoe will be used to clean the weeds about the plants and in the narrow space. In this way the whole garden can be laid out uniformly for almost everything. Cabbages and tomatoes will need the entire space in one row. This late in the season manure for a garden should be put upon the surface after plowing, and dragged down with a harrow finely. When applied in the Fall, which is the best time, it should be spread upon the surface and the seeds not allowed to germinate before plowing; then by plowing under and cross plowing so as to mix thoroughly with the soil, not too deeply, it will be in the best position and condition to benefit plant growth.

In planting seeds, instead of digging a line to put them in, press down the earth with a wheel or rake-head, an inch below the level, drop the seeds and cover lightly with finely pulverized soil, then press this gently upon them. The object of this is to have each seed firmly bedded in fine soil, which will gather moisture from below and cause the seed to surely sprout. With a firm bed under the seed it will break through the covering without cramping and grow rapidly. Should a shower cause the surface of the soil to form a crust before the seeds break through, it should be carefully removed to allow the tender shoots to spring upwards; otherwise they may become cramped down and die before seeing the light. The chickens should be kept out of the garden until the plants are too large to be injured by scratching. After that they will do as much good as harm, by destroying insects. If the hens do eat some vegetables it will do them good. Hens need green feed the year round, and should have it, too, from some source. It will pay to plant onions and beets for the hens.

Persons who are not used to sowing vegetable seeds are likely to put them in too thick, the seeds are so small. Use judgment in this matter, and where too thick, thin out the plants while young, and transplant where there are places needing more.

CHUFAS.—Chufas or earth almonds are a grass nut but not a nut grass. The nut grows to the size of a small gonber, and I have frequently grown a quart from a single nut. On land that will make twenty bushels of corn, one hundred bushels of chufas can be raised easily, and one bushel of chufas is worth two of corn, as I will demonstrate. The chufas delight in a light, sandy soil, but will grow in any soil. They may be planted any time from December to April, as they never rot in the ground or are injured by cold or frost. I plow the land smooth and lay open shallow furrows two feet apart, and in this furrow drop single seeds twelve inches apart, and cover with a board. The seed will vegetate the first warm weather, and soon show a green line along the row. The green spires will eventually meet across the rows, each spire having a nut at the bottom in the ground. The nuts do not grow more than two inches in the ground, and the hogs fatten on them in Winter, when all other crops are in the jut or barn. This is a great advantage over all other crops—no digging or storing. Poultry are very fond of them and soon learn to scratch for them, and, as they grow so near the surface, find no difficulty in getting them. It is said the peculiar flavor of the canvas-back duck of the Chesapeake is derived from the wild celery they feed upon, but epicures can have no conception of delicious game or poultry unless they have eaten chickens fattened on chufas. I have parched and ground them, and find them superior to chocolate as a breakfast drink. When we take into consideration all its good qualities—its fattening properties, its easy culture, its hardiness, and the fact that hogs will dig them as they want them, without wasting them—it is the most valuable seed the Patent Office has ever sent out, and is destined to prove a great boon to the South.—*Chas. A. Peabody in Southern Plantation.*

SALT FOR CABBAGE.—A New Jersey gardener considers salt necessary to the development of cabbage, especially in places far from the coast. He finds them more crisp, of better flavor and to keep better when salt is used than without. He used it as follows: A few days after setting out the plants, and when they are damp, either after a rain or when the dew is on, I take a small dish of fine salt, and walking among the rows, sprinkle a little pinch of salt on the centre of each plant. When the leaves begin to grow I repeat the salting, and when the centre of the leaves begin to form the head I apply salt again, scattering it over the leaves. After this I look them over occasionally and if I find plants that do not head well and appear diseased, I sprinkle the salt over freely. This will save all such plants. A quart of salt is sufficient for five hundred plants in a season, although more can be used with safety.—*Ex.*

GROWING HORSERADISH.—Around the city of New York gardeners grow it as a second crop. The ground is plentifully manured and marked off into rows one foot apart. Every alternate row is planted with early cabbages, and after the plants are set out the horseradish sets are planted in the intermediate rows at a distance of eighteen inches apart. If the horseradish starts too soon it is cut off in hoeing the cabbages, which does not injure the horseradish roots in the least. In July the cabbages are harvested and sold, and the ground is left entirely to the horseradish. As the farmer is supposed to produce only one crop from his land each year, he can manage the crop without so much labor. The soil must be deep, so as to allow the roots to penetrate a foot or more, if possible. The sets which are planted consist of the small roots which are taken from the large ones, and are from four to six inches in length.—*Ex.*

Forest Culture.

Destruction of Forests.

THE New York *Times* gives some rather startling facts and figures. The constant and reckless destruction of our forests is fast bringing us to a condition in which there will be occasion for real alarm. It is not probable that any "scare" like that which a few years ago went over England, concerning the prospective exhaustion of her coal supply, will immediately occur in America, touching the loss of our forests; but we wish something near enough approaching it might happen to stop a work that is full of evil promise. In the whole United States there is left but one really great tract of timber. It lies at the far extreme of our country and consists of about one-half of Washington territory Territory and a third of Oregon. California has, perhaps, 500,000 acres of forests now, of which fully one-half has been cut away within the last two or three years. Here in New York our wealth of maple, walnut and hickory is substantially gone, and a large part of it has been wantonly destroyed.

Wisconsin had a magnificent forest growth, but the people are sweeping it away at a rapid rate. One billion feet of timber were cut in a single year. It will not take more than a decade or two at the utmost to fairly exhaust this source of wealth to the State. Michigan and Minnesota are following in the same course, slashing away at their forests as if a tree had no right to lift its head. One of our most intelligent army officers, General Brisbin, who knows the Western country thoroughly, and to whose accurate knowledge, of this subject we are indebted for many facts, says that 50,000 acres of Wisconsin timber are cut annually to supply the Kansas and Nebraska markets alone. The Saginaw forests are even now practically destroyed, and if the Northern Pacific Railway is built, it will open up to the ax the one remaining belt of American timber in Oregon and Washington Territory.

The railroads have been the great destroyers of our forests. They use 160,000,000 of ties annually—that means the leveling of at least 150,000 acres of trees. The timber they use, also, is not the refuse or inferior, but among the very best fine young trees, eight to ten inches in diameter. Fences are also enormous consumers of trees. In the East we are learning in this regard economy from necessity; but in the West, in some States, the farmers cut down the forests with scarcely more thought than they harvest their grain. The fences of the United States, people may not generally know, have cost more than the lands, and are to-day the most valuable property, save railroads and real estate in cities. Illinois alone has $2,000,000 invested in fences, and they cost annually $175,000 for repairs. In Nebraska, where excellent herd laws are in force, the necessity for fences has been so much lessened that the fences of the State cost less in proportion to population than in any other in the Union.

The outrageous waste of timber caused by the felling of forests and the burning of the trees to bring the land under cultivation still goes on at a fearful rate. From 1860 to 1870 no less than 12,000,000 acres of forest were thus wantonly destroyed. For fuel also vast tracts are leveled of their trees. It took 10,000 acres of forest to supply Chicago with fuel one year, 1871. Our annual decrease of forest from all these causes is not far from 8,000,000 acres. Yet we plant only 10,000 acres of new forest a year.

The necessity for a commission of forestry, and the need of efficient laws in all the States for the preservation of our forests, need no further argument than these facts.

EXPERIMENTS UPON ACCLIMATIZATION.—Dr. Gray, in the *Journal of Science* for September, publishes an interesting notice of some experiments recently made by the veteran Swiss botanist, DeCandolle. It has long been noticed that in Spring vegetation in northern climates suddenly pushes out with a vigor not to be seen in warmer regions. It is a question of a good deal of practical interest as bearing upon the problem of acclimatization, whether this was due simply to the immediate influence of climate, or whether the northern plants *have in them* the power to grow with such great rapidity during the early Spring days. Accordingly DeCaudolle planted two lots of seed of the same kind of plants—the one lot gathered from northern, the other from southern Europe. The result of this experiment was as expected, the plants from the northern regions "showing a decided advantage in precocity." To further test the matter, the experimenter procured branches of Poplar, Blue Beech, Tulip tree and Catalpa from extreme southern Europe, and placed them in water along with branches taken from similar Switzerland. All were treated exactly alike, and yet the southern trees were much behind the nothern ones in leafing out. The branches from the northern Poplar tree were *twenty-three days* ahead of those from the south. The Blue Beech and Tulip tree from the north were eighteen days earlier, and the northern Catalpa twenty days earlier than the southern ones. These experiments appear to indicate that slight variations had arisen in these species, and that the same temperature and other conditions do not always produce the same effects, or in other words that the trees themselves possessed a power of more rapid growth in cases of the northern specimens.

VALUE OF TREES IN TOWN.—Mr. Griffiths, the medical officer of health for Sheffield, in his report upon the sanitary condition of that town during 1874, makes the following remarks in reference to street trees: "In the formation of new streets, and on the eve of the contemplated widening and alteration of old ones, it is to be hoped that an effort may be made to provide for trees whenever prabticable. The pleasing appearance of verdure in Summer, and the agreeableness of the shade, are benefits to the inhabitants well worth the effort and the cost. Whoever has visited the boulevards of continental towns, or even the squares of London, can testify to the advantages of verdure as offering pleasure to the eye and gratification to the mind. Moreover, from a sanitary point of view, the benefits are of incalculable value. It has been asserted that the aggregate surface of the leaves of well-grown elm, lime and sycamore trees, with their six to seven million leaves, equal about 200,000 square feet or about five acres; and these are almost constantly absorbing and digesting the carbonic acid and various exhalations given off by the putrefaction of animal and vegetable matter, and, as if grateful for such support, returns into the air pure oxygen, which reinvigorates and renews animal life. Trees thus remove poison from our midst, and to be without them is an oversight. Trees can be had which will exist, with suitable attention, in any part of the city."

Ancient Trees.—In a recent number of the *Illustration Horticole* are some interesting statistics in regard to the longevity of various kinds of trees. The annual concentric circles, so called, on the stumps give one a pretty accurate idea of the ages, although not exactly, for the reason that some trees will form two circles during one year. The table above alluded to is as follows: Judas tree, 300 years; common elm, 335; common ivy, 450; common maple, 516; white birch, 576, orange, 630; evergeen cypress, 800; common olive, 800; walnut, 900; oriental plant or sycamore, 1,000; common lime or linden, 1,100; common fir, 1,200; common oak, 1,500; cedar of lebanon, 2,000; deciduous cypress, 3,000; yew, 3,200. On the Sierra Nevada Mountains of California we have excellent illustrations of the great age which trees can attain. The red wood and what is known as the "big trees" or or *Sequoia* are examples. An accurate count of the annual rings on a stump of one of the past named showed the astonishing age of from 3,000 to 4,000 years. Foreign journals mention a popular tree worth speaking of in this connection. We quote: "Among notable trees," the Peuplier de l'Arquebuse, now standing in the Botanic Garden at Dijon, is worthy of record. This venerable poplar was planted about A. D. 1400, and is consequently now about 470 years old. It is 100 feet high and 40 feet in circumference at its base. The age and dimensions of this tree are quite extraordinary, as the average duration of poplar life seldom exceeds two centuries, and a poplar trunk of even half the dimensions of the above is seldom seen.

Forest-tree planters may well take thought of the great value of the walnut and the tempting prices now paid for its number on account of rapid devastation of surfaces which heretofore yielded largely. Already the wide-awake West is wisely turning attention to this specialty, and before many years we may expect a supply from the cultivated forests of this wood. For some unexplained reason eastern-grown walnut is inferior to that from Ohio, Indiana, Kentucky, probably on account of its more rapid growth in the latter States.

The pecan is one of the finest shade trees that grows. It will grow on any alluvial land. As timber, the pecan is next to the hickory in strength, and far superior in lightness. The wood of the pecan tree makes finer pick handles, ax handles, whipstocks, and all that sort of thing than any other tree. In planting the pecan, nuts should be obtained from the western part of Texas. There the fruit of the tree is much larger than any grown along the banks of the Mississippi. The Texas variety of the nut reproduces itself, always giving a large, sweet nut. The pecan tree is worthy the attention of all who own land in this State.—*Ex.*

Young tree seedlings should be shaded as soon as up, taking care to use some kind of shelter that will allow a free circulation of air around the plants; a screen of lath is much used by nurserymen.

If rats enter the cellar, a little powdered potash thrown into their holes, or mixed with meal and scattered in their runways, never fails to drive them off.

If a mouse makes an entrance into any part of your dwelling, saturate rag with cayenne pepper in solution and stuff it in the hole, which can then be repaired with either wood or mortar.

Porcine.

The Food of Swine.

Hogs are too often looked upon and treated as a very filthy animal. They can be made filthy by filthy feeding and treatment, or be kept healthy and clean by giving clean feed and drink, and keeping in a clean place. We clip from the Detroit *Tribune* some facts on this subject that we heartily approve:

If there is any one thing in rural practice which needs reforming more than another, it is the matter of raising and feeding swine. From the day they are large enough to eat they are offered all manner of refuse about the place, such as rank weeds, filthy slops, spoiled vegetables and meats, dead fowls, etc. They are allowed to rummage the dung yard and glean the refuse of food in the feces of cattle and horses, on the ground of economy. The quantity of food saved in this way is very insignificant. The objections to keeping swine in this way are so serious, that the reasons in favor of it have no force at all. The origin of trichinosis in swine may be always traced to the consumption of vile stuffs in their food, or to being housed and yarded amid filth and foul air. Every few months the press announce a case of trichinæ in an individual or a whole family, with all the horrible details and sufferings which attend the parasitic attack. Only lately some new cases are reported in the West, which are alarming. We are quite sure that every farmer and every one who feeds and fattens a pig will only need to have their attention called to so important and serious a matter to secure a complete reform in the practice of feeding an animal which will take whatever is offered to it, and will live in the most filthy holes and yards. On the farm the swine should have clover pasture, and for swill only milk and meal or grain; no dish water or meat scraps from the table, as these are sure to putrefy and poison the mass in the barrel or tank. Pure water, with a little meal added, is preferable. Give the scraps from the table to the poultry, while they are fresh. Spoiled meats should never be given to any domestic animal. Large numbers of swine are frequently confined in small quarters, with very little regard to cleanliness or pure air. Of course, some of them will lose appetite, the first sign of the derangement of the organs of nutrition and assimilation. They do not thrive, but they are kept along till slaughtering time, and are dressed and packed among the lot. Such animals are extremely liable to be infested with trichinæ and other parasites; and those who consume them as food expose themselves to sickness, diseases of a lingering nature, and to death in a most horrible form.

Interests, therefore, as dear as health and life require a thorough reform in keeping and feeding swine. Let their food be as pure as that which other animals consume. Let them be kept in clean quarters and have pure air. Let diseased or unthrifty animals be separated from those in health, and we may have no fears of trichinosis among either swine or human beings.

Sugar Beets for Fattening Swine.—Jonathan Talcott gives a statement in the *Boston Cultivator* of an experiment performed on Suffolk pigs where sugar beets were largely employed for fattening. The animal was about a year old, and the feeding on boiled sugar beets, tops and roots, began on the 16th of August and was continued three times a day until the 1st of October, after which ground feed was given, consisting of two parts of corn and one of oats, three times a day, till the animal was slaughtered, the meal being mixed with cold water. The result was, on the 15th of August, when the sugar beet feeding was begun, that the weight was 360 pounds; September 1st, 390 pounds; October 1st, 450 pounds and November 1st, 520 pounds. This is the substance of the statement given, by which we perceive that the increase the last of August, when fed on boiled sugar beets, was at the rate of two pounds per day. This rate of increase on the same food continued through September. When fed on ground corn and oats, made into cold slop, the gain for the next fifty days was less than a pound and a half per day.

Weight of Hogs by Measurement.—The same general rule applies to smaller animals—hogs, sheep, etc.—as to cattle. This is, to take the girth of the hog just behind the shoulder blade, getting the dimensions in feet and inches, and measure the length of the back; multiply these measurements together, which, reduced to feet, gives the square superficial feet; multiply again by the number of pounds allowed to the superficial foot. This depends upon the size of the animal; for animals having a girth of from three to five feet allow fifteen pounds to the superficial foot, and if the girth is less than three feet, allow eleven pounds to the superficial foot. Suppose a pig measures two feet in girth, and two feet along the back; multiply these together gives four square feet, and this multiplied by eleven (pounds to the superficial foot for animals, animals measuring less than three feet in girth) gives forty-four pounds as the weight of the pig.—*Prairee Farmer.*

Breeding Sows.—The best formed sows only should be saved for breeders, and when one such is found and proves to be a good mother, keep her, even for four or five years. From the young sows select only the very best.

Rector.—"Those pigs of yours are in fine condition, Jarvis." Jarvis.—"Yes, sir, they be. Ah, sur, if we was all on us only as fit to die as them are, sur, we'd do."

Pisciculture.

PROGRESS AND PROSPECTS IN FISH CULTURE.

No important industrial art has made more rapid progress within the last half dozen years than fish culture. The readers of the California Agriculturist have kept pretty well posted in this matter, as this department has been made of special interest by giving the most satient information which has come to the editors notice upon this subject. Artificial hatching is reduced to a science; or, in other words, to a practical and positive certainty, and is no longer an experiment, although much improved by recent experimenting tests. Wherever clear ponds of water are found, or streams and rivers run, the water can be supplied with myreades of the most valuable kinds of fish hatched in troughs, and fed in artificial or natural ponds and streams till they are strong enough to take care of themselves in the deeper waters where enemies have to be avoided and a living obtained. We read of rivers, ponds and lakes being stocked with millions of fish by the various Commissioners which different States have appointed for the purposes. Laws are passed for the protection of fish during spawning time; and the public is being instructed in many ways to an appreciation and better understanding of the benefits to be derived from an intelligedt system in all public waters.

What is, perhaps, of equal importance, is a better understanding as to how fish culture can be made successful and profitable on a smaller scale in such ponds or streams as many persons may be able to provide with little expense. We predict that the time is not far distant when fish will be as commonly grown all over the country, in artificial reservois, as pigs and chickens are now in farm yards. Wherever water can be obtained that is clear, and free from deletercous mineral and organic substances, and that can be kept at a degree of temperature suited to fish, life and growth, and that can be supplied with atmospheric oxygen in sufficient quantities to supply the resperation of fishes, and that can be shaded in places to afford shelter from the sun, and from observation, so that the fishes will feed at ease and at home, it seems to us that the essential conditions to health and growth will be complied with.

The matter of food will be found a very important one, but not more difficult to master than the feeding of animals. We believe, from the best information we can gain upon the subject, that a system of ditches will be the most economical form of arranging for fish culture. These can be dug at any width or depth, and run in together in any most convenient and artistic manner, easy to dam at any point or to shade in any place, can be graveled here and there, and be generally arranged so as to be practically just the thing on a small scale for fish of all ages and size. The supply of water must depend upon circumstances. Whether from natural or artificial wells or streams it makes but little difference so long as it is pure enough and is aireated sufficiently, which can be artificially done by wind power at little cost. We shall aim to keep our readers posted upon whatever progress is made in any direction so far as we can glean it, and shall expect such of our friends as feel an interest, and have had experience in the matter, to assist with such facts as they may have acquired.

Fish Culture.—In times past I attempted fish culture, and even before I was able to undertake it I did plead with my people, for the pleasure and profit, to begin the work. There are many who saw my pool during the war. One who, I remember, in 1862, endeavored to find the bottom, and said it was so cold (in August) he could not dive deep. I heard those who saw the relic after the embankment gave way, speak of fish as by the million. The pond had an embankment of some nineteen or twenty feet, with eighteen feet of water at the deepest point, and covered perhaps one to two acres at least. My lots cornered in parts for stock water, and there was so much grass that but little dirt washed in. My overseer and myself caught, with a dip-net, four hundred small perch in 1860 or 1861, and I had a pond drained out that cat-fish, designedly or otherwise, had got into and were destroying the perch. The perch caught and put with others in the new pond did not count. I know from a cistern yea, also one in Vicksburg—that a perch too small for eating did in two years, in one instance in one year, grow to size for table. Fish is cheaper than fowl, cheaper than pork, or beef, or mutton, if fed. All

know the Indians, especially Northern, subsist largely on fish. Fish culture, North and East, is attracting State aid and large expenditures are made. A great many localities in hilly sections can have ponds at the mere cost of embanking carefully between short hills. Even gentle slopes, by digging out and embanking a pond large enough to hold stock water, and grassing all around to keep earth and sediment from injuring water, will afford fish for any family.—*Southern Paper.*

The University of Virginia has had a hatching house erected on its grounds by the Commissioner of Fisheries of that state, and fish culture is to be included in its course of instruction. Mr. Fred Mather, of the U. S. Fish Commission, has been engaged to superintend the work of hatching the salmon and trout this season. Mr. Mather's long experience in fish culture, especially at his Trout Farm in Honeoye Falls, N. Y., renders him amply qualified for the position.—*Ex.*

Ninety-five per cent. of the California salmon lately received at the Westport, Conn., trout ponds have been successfully hatched.

Sheep and Goats.

CLEARING LANDS WITH ANGORAS.

At the risk of wearying our readers upon this subject, we still have something more to say about Angora goats. We have lately had a long talk with Mr. L. J. Burrell, who owns a flock of these animals, and is pasturing his chapparel lands upon the top of the Santa Cruz Mountains. Mr. Burrell says the Angora goat is just the best thing in the world to help clear such lands of undergrowth brush of every kind. Where the brush is once cut down and burned they will eat every sprout that shows itself, and there is no better pasturage for them than chapparél and chimesel clearings. They fatten upon the young shoats of oak, maple, wild cherry, mansanita, buckeye, madrone, willow, wild rose, and all other sorts of brush that make the thickets on these rugged hills. The soil there is the best in the county for heavy vegetable growth, and invaluable for orchard and vineyard when once reclaimed from the rank growth of shrubbery. Mr. Burrell seems much elated at his success with his goats and his progress in clearing his lands. With the exception of having lost some fine animals by California lions, which find a congenial home amidst the mountain thickets and ravines, his success has been all he could ask and even more than he expected, although he was sanguine when he started into the business over a year ago. It was thought by some that the Angoras would not do so well in such a locality as upon open, grassy hills. When the value of these animals for clearing lands, that now have to be grubbed and worked over so laboriously, is better known, doubtless they will be in great demand for this purpose in connection with the profits that can be derived from them, which is of first importance. We learn that the farmers in Oregon, where much of the best land has to be cleared, have found out the value of goats for this purpose, and that already several orders for these animals from Oregon have been filled by California breeders. On its own merits alone, where pasturage has to be supplied, the Angora is a profitable animal to the herdsman; and when they can be profitably employed in clearing lands, hoarding themselves at the same time off the refuse, as it were, and doing better than on grass alone, it is an object worth some consideration, surely.

Foot Rot.—Be so good as to inform me through your valuable paper the best cure for foot rot in sheep. Amongst a stock of cross bred lambs a great many are affected. I have applied butter of antimony, Cuff's powder, tar, etc., but with little effect. Shepherd. When foot rot has been neglected for some weeks and the sheep continue on soft ground, which favors the superabundant growth of degenerate horn, it becomrs confirmed and difficult to cure. The secreting textures persist in pouring out lymph and weak faulty horn, instead of tough, firm protecting covering of the healthy foot. One of the chief difficulties in the way of cure is to restore the secreting parts to a sound state. The first step must be with a strong knife, whilst the hoofs are soft, to carefully cut away all loose unsound horn. Where the hoof is extensively affected, this cannot be done all at once; two or three operations will be necessary. Fungus, bad-smelling growths which appear in most troublesome cases, are got rid of by any strong astringent. Butter of antimony is often used for such purposes, and cautiously handled, answers fairly. Some shepherds use it mixed with about equal parts of impure carbolic acid and diluted with two or three parts of oil. In some districts copper sulphate ointment, made in the proportion of one to four of fatty matter, is in good repute, and is improved by the addition of one part of the antiseptic deodorizing carbolic acid. Such treatment may be varied by dressing of zinc chloride solution of mercury penitrate solution. It will be found that the successful treatment of foot rot depends not so much on the particular dressing employed, as upon careful paring away of faulty horn, examine and doctoring the foot at intervals of two or three days, avoiding strong caustics, and placing the flock on dry, firm ground. Amongst sheep on arable land, foot rot is usually cured quicker than in those on grass.—*North British Agriculturist.*

Danbury Bailey.—You have seen pictures of shepherds with the proverbial crook in their hands. I didn't think a party could be a shepherd without a crook, any more than a man could be a leader of an orchestra without a pair of pants. I was glad that the first man I saw tending sheep carried one of these crooks. I didn't know what a crook was for, but always believed it was a badge of the occupation, whose origin I could not fathom, handed down from century to century since the time when sheep were invented. Imagine my disgust when I saw this shepherd use the sacred crook to capture the straying animals by catching hold of one of their hind legs and tripping them up! The awful truth came upon me like a flash, and I sat down heavily, a broken-hearted man. I had thought it a beautiful emblem, and it proves a hind-leg snatcher! Thus flouted the wind from another sweet vision of youth. I must have more salary, or I'll die, I fear.—*Ex.*

Sheep on a farm yield both wool and mutton. They multiply with great rapidity. They are the best of farm scavengers, "clean a field" as no other class of animals will. They give back to the farm more in proportion to what they take from it than any other animal, and distribute it better with a view to the future fertility of the soil.

Stock Breeder.

Organic Adaptation.

Under this heading Professor Kinley, of the San Jose Institute, has written to the *American Stock Journal.* The subject is an important one for all stock men to consider, and we take pleasure in transferring what he says to our columns:

Traveling over this great stock raising State, I have been frequently impressed with a truth which I think equally applicable to all parts of the Union, viz: In our effort to raise or improve live stock, reference should constantly be had as to the conditions under which it is to be grown. Within the boundaries of the United States is almost every conceivable variety of climate soil and topographic character. Florida and Southern Texas are tropical; the mountain regions of the northeast and northwest are perfectly Arctic; while between these extremes the climate takes endless modifications, shading off into the one or the other, according to position, latitude or prevailing wind currents. We have mountains and valleys, plateaus and lowland plains; we have sterile lands and fertile lands, wet lands and dry lands. The average rainfall on the coast of Alaska is I know not how many score inches, while in some parts of New Mexico and Arizona it seldom rains at all. In other parts of the Union the annual amount of rainfall will be found varying between these extremes. In some parts of the United States the climate is subject to great extremes of heat and cold, while along the Pacific coast there are places where the temperature varies but little the year round. It would be absurd to suppose that all these various conditions are equally adapted to every kind of live stock, or that any one kind would flourish equally well in all. In the wild state the goat chooses the mountain and the buffalo the plain. And any one who has studied the geographical distribution of animals and plants will find that the principle has a very general application. It is not an accident that the lion and the leopard tenant the Torrid Zone and the polar bear the Frigid. Neither is it altogether the art and skill of man that have made the Arabian horse the highest type of the equine race.

What is true of species is also true of varieties. Some varieties of the same species will flourish in *habitats* in which others will perish. But there is an elasticity in the constitution of both animal and plant that will carry it out of its original residence and cause it to flourish under very different conditions. In fitting itself to this change of place there is an organic change of character. If we could gather together the primordial ancestors of the domestic animals and plants, we should find some of them so changed in their progeny that we could hardly recognize them as of the same species. It is doubtless true of domestic animals and plants, that while they have lost something of the rugged strength of the wild type, they have also gained something in that elasticity of constitution which enables them to live and flourish under various climatic and other influences. But while I thus state the principle of adaptation, it must be admitted also, on the other hand, that it is true only within certain limits, beyond which neither animal nor plant can prosper. In the early settlement of Minnesota, the Winters about Minneapolis were too severe for the ordinary apple. But there have been found, and in some cases perhaps grown on the soil, hardy varieties that endure their coldest Winters. One of these, I believe, was imported from Siberia. Doubtless the domestic animals, when removed to colder climates, suffer often from the severity of the Winters; but long years of acclimation develop a hardier race, constitutionally adapted to the new *habitat.* So, animals taken from the mountain to the plain, or from the plain to the mountain, undergo in time corresponding changes. The mountain demands muscle and litheness of limb to enable them to obtain their food from places not easily accessible, and muscle comes. The ox of the plain, developing through generations, becomes agile. Both body and limb lose in weight, bones become smaller and more compact and fat gives place to muscle. But all this implies a corresponding change of organic structure. The animal is still an ox, it is true, but it is no longer an ox of the plain. He has grown in his organization and become modified to his condition. Our domestic sheep came from the mountain, and despite its long years of domestication, it still remembers, through its organs, its original instincts. But the Romney Marsh sheep seems to have forgotten entirely its instinct for the mountain, and takes to the lowland from preference. It is still a sheep, however, but it is not the Argali or the Bighorn. Let it be admitted, as I presume it will be without further argument, that changed conditions demand and effect organic changes.

Improving the Dairy Herd.

Dr. E. L. Sturdevant, of Massachusetts, concerning the need of increasing the milk yield of our dairy cows, notes the low price which has ruled for dairy products, and rightly says that decrease in price must be met by enlarged productiveness in the milk-making machinery, and better use of the food material employed. He says further: How can the dairy farmer increase his production? Clearly by increasing the milk capacity of his animals. Suppose two cows weighing 1,000 pounds, one giving 1,300 quarts of milk, the other 1,800 quarts. Both require, say 30 pounds of hay per day, or its equivalent, of which say eight pounds go to support the vital processes. Under this supposition, four tons of hay will produce, when consumed by one cow, 1,300 quarts, and by the other 1,800 quarts yearly. These figures, 1,300 and 1,800 represent the actual average of common and superior dairies in New York State, and three per cent. of live weight, or thirty pounds of hay or its equivalent, is, according to Pabst, the amount required for a cow in milk, while about eight pounds is required for sustenance only. This leaves the figures as stated. Let us assume the feeding value of this food to be equivalent to $8 per ton, and the average price of milk to be 2½ cents a quart, net, then the average cow will bring a profit of $10.56, while the average superior cow will show a profit of $13. Suppose, however, the cow is a very superior one, and will yield 3,000 quarts, then we have a profit, under our supposition, of $43. This illustration indicates clearly, then, how the farmer can meet the depression in the value of his milk by increasing the productiveness of his cows. The experience of every one who has had any acquaintance with the breeding of cattle testifies to the value of a thoroughbred bull, or, to use a common expression, the grading up a herd toward a thoroughbred. The introduction of thoroughbred dairy bulls into the regions which supply dry cattle would add to the dairy quali-

ties of the stock raised from such a bull with the certainty of a law of nature. For the thoroughbred transmits truly his characteristics, and the more nearly the cattle approach the type of the thoroughbred the more nearly they approach his qualities. Let the dairy farmer, therefore, meet the fall in the price of product by an improvement of the milking quality of his stock. Let him seek this improvement by the use of the thoroughbred. If he desires the Short-horn, let him seek the animal which has departed from the Short-horn type toward the dairy type, and which comes of a milking line of ancestry. If he desires the greatest certainty of improvement, let him seek the Ayrshire bull of a milking strain, for power and functions are allied, and the Ayrshire is moulded, and has been for generations moulded, on the type which has been universally recognized as belonging to the larger milker. The merchant recognizes the fact that the manufacturer who manufactures most cheaply can offer him the goods at the least cost, and that those goods which are bought at the least cost can furnish the most profit in their tine. Let the farmer see the bearings of the same fact, that the quart of milk which is furnished him at the cheapest rate will produce for him the most profit, and the farmer who gets more milk from his food than any of his contemporaries cannot fail to be successful. I will close by asking the question: "Is there any other way of increasing the productiveness or the profitableness of your herds than by changing them into thoroughbreds of the proper character as rapidly as may be, by either the purchase of thoroughbreds, or perhaps still it is to be preferred on a large scale, the introduction of thoroughbred bulls."

Kindness to Farm Animals.—Kindness to animals in every respect is as highly appreciated, apparently, as among the human family; therefore keep the animals in good humor by keeping in good humor yourself. The man who makes a practice of judiciously fondling his stock, in the yard and stable, has a more orderly, good natured stock than he who cannot pass them without venting his spleen by a kick or curse upon some poor, unoffending brute. In the one case the animals are all rejoiced to see him, and are quiet among themselves, seldom crowding each other, except as to show their appreciation for their master and keeper: in the other case they partake of the disposition of the master, are cross, hook and kick each other; and, instead of expressing pleasure at the appearance of the owner, are apt to partake of his disposition, returning his greeting in kind. We were forcibly impressed by this a few days ago when visiting the farm of one of the most prominent and successful breeders of fine stock in our State. We noticed whenever he approached, the animal recognized him with a low whinney of delight, or a kind look, which the master was sure to return by a caress of the hand, or a gentle word. We did not see a single animal while there that would not permit you to come up to it in the open field, neither did we see one poor in flesh. And here we will state, for the benefit of those who treat their stock harshly, that kindness goes far towards making the provender last.—*Rural Sun.*

Oil Cake for Feed.—An English writer to the *Millwright* asks: Why is it that so much of the linseed oil-cake produced in your country, especially in the West and North, is exported to England? It must be that its value as food for cattle and stock of all kinds is not known or is not appreciated by stock feeders of your country. American oil-cake commands $50 to $60 per ton in England, and as the English are the best economists in the world they would not pay more for oil-cake than they would for anything else if it were not the most valuable for feeding purposes, particularly when we consider the extent to which they feed for fattening. Experienced English feeders all say that there best beef is that from cattle fed on oil-cake meal, and it is universally known that the English know how to make and appreciate good beef. Oil-cake meal is equally valuable as food for horses, cows, sheep and hogs. It is the richest food known; it gives a healthy tone to the animal, fattening the lean ones and maintaining the health and vigor of the strong. The great value of oil-cake for cattle food has long been known, yet it is by no means sufficiently appreciated in your country, nor upon the part of very many persons who own or feed stock is it clearly or fully understood.

Care of Young Stock.—Some farmers have advanced the opinion, and even practiced upon it, that to have hardy stock they must be exposed to the weather and stinted in food while young; or, in other words, that a calf or a colt well fed and cared for will be naturally tender, and must be so fed through life to be kept in good condition. This is not so, in the first instance, for stock half kept while young can never recover from injury thus received, and no after care in feeding can make as good an animal as would have been produced by proper treatment in early life. To keep stock profitably, they should always be kept in thriving condition, receiving extra attention while young and growing, especially during the Winter and Spring. Good shelter and plenty to eat and drink are especially necessary at this season of the year to make valuable horses and cattle hereafter.—*Wool Grower.*

The Destruction of Bison on the Plains.—Where, years ago the mammoth herds of bison roamed the plains and were hunted only by the Indians as necessity demanded, now lie the bleaching bones of million of those noble animals sacrificed simply for their hides. For the past two years the work of destruction and annihilation has gone forward, and to-day there is not enough buffaloes to form what was at one time considered a moderate sized herd.

Hay, Grain Etc.

SEASONABLE SUGGESTIONS.

An unusual amount of moisture in the atmosphere and soil, with warm weather, showers, etc., is likely to make the growth of grain very tender, so that it will lodge before its time for ripening, and be predisposed to attack by rust. Many of our most observing and practical farmers find it necessary to either pasture down their grain fields with sheep or cattle, or else to run a mower through them to cut back and check the soft growth. A good, early stock of roots is well enough, and is even an advantage to grain, no matter how good the season may be, but it will not do to allow a tender growth of stalks prematurely. If pastured or mowed to the ground, the fields of grain will start up again in dryer and sunnier weather, with healthy, strong stalks, capable of standing alone and healthy enough to resist the attacks of *fungi*, so destructive and to be dreaded. Of course, we can give no instruction in this matter to experienced farmers in this country, but call attention to it for the benefit of such as may be inexperienced.

Where a field of early sown or volunteer grain shows that it is likely to be choked with weeds and foul stuff, it is better to cut it for hay and to pasture it, than to allow the weeds to rule and ruin. We have known cases where it paid to resow the fields with seed after the grain was several inches high, and cultivate the seed in and the green stuff out by thoroughly working the surface with plow tooth cultivators and harrowing finely. The crop of grain from the last sowing would be clean and as fine as possible.

Where one has a use for hay, as every farmer should have, with good stock to eat it, or where the market for hay is within easy reach by team or railroad, a crop of hay often proves more remunerative than one of grain. We think it advisable to make hay of such portions of grain fields as are likely to lodge badly, or that are foul, at any rate. In the vicinity of San Jose, many fields are sown with wheat yearly for hay. Many farmers when they sow their seed, do not know whether they will make hay or grain, but calculate on being governed by circumstances over which they have no control. If the growth is more favorable for grain, then let it stand; but if it shows too rank a growth for grain, and promises better returns as hay, or if it commences to rust, it is made at once into hay. There are *chances* to be taken in farming in California, but the wise farmer will take advantage, even of chances.

Now is a good time to poison squirrels. Use plenty of strychnine and phosphorus. Probably phosphorus is the best dead-shot, when well prepared, of any poison known, patent poisons not excepted. In boiling water phosphorus will easily dissolve. To six lbs. of brown sugar put two quarts of water, and bring to a boil in an iron kettle; then take from the stove into the open air out of doors, add five sticks of phosphorus and stir till dissolved. Put this into a peck of wheat and stir, mixing flour till it is dry enough to handle conveniently. The rodents will like this prepared wheat, and it will surely kill every one that eats a single kernel. It is not dangerous to handle in this way, except with the bare hands, which in no case should be done. Ground squirrels and underground politicians cost the farmers too much to be allowed their own way in this State much longer.

FLAX CULTURE.

The Coast counties in this State find the culture of flax profitable, simply for the seed, which is contracted for by the oil factory in San Francisco. In the hot interior valleys but little flax is grown. A temperature and degree of moisture in the atmosphere favorable to the growth of oats appears to be also best for flax. We hope to see the time when the fibre will be utilized on this Coast, and flax culture become more general. Mr. Wilson Watson, in the Iowa *State Register*, writes the following facts which are interesting:

In 1873, throughout the world there were over 3,000,000 acres in flax. Russia had 1,600,000 acres and the United States 61,204, or less than half of "Auld Ireland," which had 129,432 acres. Derry, Down and Tyrone, in Ulster, Ireland, had 4,080 more acres in flax than the entire United States. Ireland has 21,000,000 acres of land, while in 1870 the United States had 408,000,000, of which 218,000,000 were unimproved. Flax culture should be in America what it is in Russian and Ireland, an avenue of private and public prosperity.

In 1870 thirty-three states in the Union raised over 27,000,000 pounds of flax, the bulk of which was sacrificed by being deviled into flax "moss," for upholsterers' use in place of hair. Instead of this, had it been properly fixed for manufacture, the United States annual expenditure of $25,000,000 for flax and its manufacture might have been materially reduced. Now this could be easily accomplished through the Flax-puller of Tyler and Decorticator of Lefranc, the newest and finest flax machines in the world.

During the past twenty years the United States expended three hundred and fifty-four million dollars on flax and its manufactures, the bulk of which could and should have been furnished by the United States.

During the past twenty years America more than doubled its wheat exportation to England, while Russia decreased more than one-half. In 1874 (nine months) America sent 58 per cent. of England's entire wheat supplies, or nearly six times more than Russia, which only sent 11 per cent. America also received nearly 7 per cent. more for its wheat than Russia, amply demonstrating the superiority of American over Russian wheat.

Wheat land is best for raising flax. America makes no effort to secure a slice of England's flax and hemp trade, worth nearly $100,000,000 per annum, monopolized by Russia, but annually buys millions of dollars' worth of raw flax of Russia and its manufacturers of England. When will this suicidal importation cease? America excels Russia in wheat; it could also surpass Russia in flax.

Rice Culture in Louisiana.

The following in regard to rice culture we glean from southern exchanges, believing it will be interesting to many of our readers. We expect the time to soon arrive when the culture of rice will become a profitable industry in California upon reclaimed marsh and tide lands:

Before the war almost all the rice grown in the United States was raised on the immense plantations in South Carolina. Special attention being given by the planters in that State to the selection of good seed, and the thorough irrigation and culture of the fields, a superior quality has been produced which brings in the New York market a cent a pound more than the imported Rangoon or Pattna. Immense injury was done to these low lands by the neglect consequent on the war, the dykes being broken down, the system of drainage destroyed and everything allowed to go to rain. So widespread was the destruction that the crop is now not equal to one-fourth of what it was in 1860. It is estimated that the production was about half a million barrels of rice.

Louisiana has entered as a competitor for this trade, with prospects of great success on account of her suitable soil and climate. In the old days of slavery only a small quantity had been raised in the State, amounting to about seven thousand barrels in 1860. Instead of decreasing, like the crop in South Carolina, the production increased during the war, and in 1873 it was nearly ten thousand barrels. Then a great impetus was given to the business, many of the planters turning partially from cotton and sugar to rice planting, and year by year a larger area of land has been given to

this culture, with the most encouraging results. During the last ten years the increase has been more than ten-fold. The crop for 1875–76, just harvested, is reported to be the most abundant ever produced. The area under cultivation was 39,000 acres, or about sixty per cent. more than last year, and the yield is estimated, by competent judges, at 175,000 barrels. The yield would doubtless have been still larger, but for the fact that a large portion of the land under cultivation was for the first time planted with rice and under the management of inexperienced planters. The seed used has been mostly of South Carolina growth, and to this is largely attributed the improved quality of the present crop.

Statement of the Louisiana rice crop for the past twelve years, showing the steady and almost uninterrupted increase from 9,866 barrels in 1864–65 to 175,000 barrels in 1874–75, furnished by Messrs. Dan Talmage's sons:

YEARS.	BARRELS.
1864–65	9,866
1865–66	11,943
1866–67	20,464
1867–68	24,663
1868–69	41,917
1869–70	57,956
1870–71	61,256
1871–72	29,873
1872–73	52,206
1873–74	97,126
1874–75	115,000
1875–76	175,000

The total yield of American rice may be safely estimated at 73,000 tierces and 175,000 barrels. It is a much more profitable crop than either sugar or cotton.

SMOKING IN THE BARN.—"No smoking" ought to be posted in every barn. There is not much difference between having a horse-thief around the stables and a man cleaning off horses with a pipe or cigar in his mouth; and there is no hired man much meaner than the one who, when his employer comes around, slips his pipe into his pocket or holds his hand over it. All such fellows should be paid off and started off. As for the proprietor himself going into the barn with a pipe in his mouth, no complaint can be made; but if his establishment burn up, nobody should cry unless it be his wife and children. Lightning, incendiaries and spontaneous combustion combined do not cause so many barns to be burned as the pipe, and generally at least one good horse goes, too.—*Spirit of the Times.*

DR. LEE, a distinguished agricultural writer and chemist, said, in an address before the New York Agricultural Society: "I regard it as one of the greatest discoveries of this age, that about ninety-seven per cent. of the ingredients which make up the whole substance of wheat, rye, barley, oats, peas and beans, exist in the air in inexhaustible quantities. To transmit these aeriform bodies into the plants above named and into grass and roots at the smallest expense is the object of nearly all your hard work." This was spoken a thirty years ago, and the doctor says that the views then expressed will not now be called in question.

AN English farmer accidentally dropped a grain of wheat among some seeds he was sowing in his garden, and having a curiosity to protect it, gave it every chance to come to perfection. The result was sixty-four heads—forty very large—containing 3,044 counted kernels, not including some picked away by an enterprising hen. He leaves readers to draw their own conclusions, only adding that, as the result of frequent investigation, he never found more than twenty-five ears to one root growing in his fields.

The Horse.

Humanity to Horses.

[The following verses are issued on leaflets for distribution to drivers and others having the care of horses, and on cards for hanging up in stables, by the Society for Prevention of Cruelty to Animals:]

Going up hill, whip me not;
Coming down hill, hurry me not;
On level ground spare me not;
Loose in stable forget me not.

Of hay and corn rob me not;
Of clean water stint me not;
With sponge and water neglect me not;
And of soft, dry bed deprive me not.

Tired or hot, wash me not;
Sick or old, chill me not;
With bit or reins jerk me not;
And when you are angry, strike me not.

FEEDING AND WORKING HORSES.

HORSES that work need an abundance of good feed, should be fed at stated times, and be systematically cared for. The jockey who is training a horse for the race-course knows how essential regularity in feeding is, and is always very particular about the quality of the feed given his training horses. We have seen them pick over the hay by the handful, taking out every defective straw or objectionable weed with the greatest of care; also sifting out the oats and washing clean before giving them to the horses, and always feeding, watering and exercising by the time-piece—this for months, so as to prepare the system to expect feed, and rest, and exercise, at a certain time, and to be prepared and ready for it. Every hard working man who has been regular at his meals for a time knows how his stomach tells him exactly when the hour and minute of meal-time arrives, and how bad he feels if the food his stomach craves is not ready, whatever the cause of irregularity may be. It becomes an essential part of his good nature and comfort to get his meals on time. He can work with a good will if regular in his hours of labor, and endure more without fatigue. His muscles and his stomach are stronger. And while a variety of food is essential, there are certain things that seem equally so at every breakfast, dinner or supper. As it is with a man who labors so it is with the horse in these particulars, only more so, for the horse has no mental diversions or cares to call his mind from his stomach. And when his day's labor is ended it is cruel to ask him to do more if it can be avoided. When we take into consideration the nature and wants of the animals under our charge, and intelligently care for and treat them, we can obtain better work, and keep them in better condition with ease to the animal and satisfaction to the master.

The teamster and farmer are not expected to be as particular as the jockey is about food and exercise, nor is it necessary; but they should work and feed by some rule that can be conveniently conformed to. That rule should be established with reference to the needs of the horse as well as to the nature of the work to be done. We have known many teamsters and some farmers to keep their horses at work all day without anything to eat from morning till night. This is poor policy as well as needless cruelty. A horse can do one-fourth more work if allowed an hour or two to feed at noon. We know this by actual experience at the heaviest kind of teaming and farm work.

One word about hay and grain, for horses. We can never advise hay choppers. They make the hay no easier of mastication or digestion, and when chopped the horse has to eat every description of weed and refuse that it contains. We prefer to let the horse pick over the hay himself and reject whatever he doesn't like, feeding no more at a time, of course, than will be eaten without unnecessary waste. As to the grain, it is economy to have it ground, as it saves a working horse a great deal of labor in mastication. Soaked grain is not so good. It is apt to get sour and act injuriously, or be swallowed down without chewing, doing no good and causing dyspepsia. We have found that a mixture of ground barley, oats and wheat bran, *fed dry*, is the best for a work horse. He can eat it no faster than the natural moisture of the salivial glands prepares it for the stomach, and it will all be thoroughly digested and assimilated by the blood for use in supplying vital strength to the system. A horse will soon learn to eat no more of it than he needs, if given in any quantity, and he will keep healthy and strong, be hearty and full of cheerful life and vigor, and stand up to a good deal of very hard work, under kind and systematic treatment.

About the Mule.

The mule seems to be again coming into favor in England. At a recent show in that country, the prize mule was seventeen hands high and proved to be much stronger than a competing horse of equal size. Another mule exhibited was only twelve and a half hands high, which the previous week had been driven 220 miles in forty-two hours enfering in London the evening of the second day at a gait of ten miles an hour and with no signs of fatigue. These evidences of toughness and endurance seemed to have somewhat astonished John Bull, and he is now discussing the question as to whether the mule will prove as a work animal of greater value than the horse. The farmers of the West and South (in the United States) could easily give him a solution of this question. Let him visit the Blue Grass regions of Kentucky, Tallaway, Saline, Lafayette and other counties in Missouri, any portions of the rich cotton growing districts of the South, and he will there find constant evidence that for good, steady work, healthfulness and economy in keeping, there is no animal to be found which is the equal to the mule. We believe, further, that for constant work either in harness or saddle, "day in day out," the mule is decidely the superior of the horse. The best riding animal we ever owned for both speed and endurance, was a mare mule. She was fully sixteen hands high, was as graceful as a deer in making an action; just wild enough to use constant watchfulness, and if properly confined, in one night's time would paw herself out of almost any stable. But what a luxury it was to ride her! head always up, spirits never flagging, going as freely at the outcome as at the start, it seemed to make no difference to her whether her journey was of an hour or a month! We knew her gaits as well as we know the furniture in our sanctum, and knowing either the distance or time, could tell the other by the six-mile running walk of hers, as well as by the chronometer or mile-post. For long distances, the best traveler we ever rode behind was a mule. We have both in this State and Kentucky, seen mule spans which, hitched to a buggy, for style and speed are hard to excel. Give them good grooming and proper handling, and they will certainly show it, and just as much as a horse. The time has been when mules were the fashionable animals of Europe. Who does not remember the ambling mules ridden by the luxurious churchmen who presided over the monastries and abbeys of England in the days of Friar Tuck and Richard Coeur de Leon? In the reigns of the Bourbons the mule was an equal favorite in France, and was alone considered appropriate to draw the gorgeous carriage of his majesty in its annual journey to Fontainbleau. In Spain, even yet he is petted and caressed and constantly receives the attention he deserves, and the proud hidalgo, the jewelled senorita, and even royalty itself, delight in doing him honor and riding him with rich and costly housings. The day may come, for aught we know, when the mule shall be as popular as the thoroughbred horse now is, and when an equal amount of care and attention will be given to his breeding.—*Journal and Farmer.*

HORSE RACING AT FAIRS.—A correspondent of the *Indiana Farmer* does not accept the opinion so often expressed by horseman that if it was not for racing the Agricultural Societies would fail to take money enough at the gates to pay their running expenses. There are many who really believe that it would be impossible to conduct the fair successfully without the fast ring. They further believe that the encouragement of fast speed in a horse is legitimate work of agricultural societies. Neither of these propositions are true. The fact that the largest number of people are present on the day that the principal racing comes off is cited as evidence that the racing drew them. And to one who has given but little thought to this subject, or has not been behind the curtains and seen how these things are managed, this is a plausible conclusion; but to one who knows how these things are managed, the argument is not as conclusive. While the friends of the fast ring would have the people believe that the fast horses brought the crowd on the day of the racing, they argue differently when it comes to making out the programme. The reasoning then is that the racing must come off on the day when it is almost certain the greatest number of people will be in attendance so that they can have an opportunity of witnessing it. The argument stands in about this shape: The racing is arranged for a particular day, because that will be the most popular day, and the people are there on that day because the racing is to come off on that day. One of the most successful fairs of the Indiana State Board of Agricultural was when no premium was offered on speed alone. Not long since the Ohio State fair was a grand success without any premium exclusively on speed. The New York State fair held last fall realized $40,000 receipts $10,000 more than at any previous fair, yet no premium was given on mere speed. Various county societies have held their fairs without the presence of the fast ring, and, others things being equal, their success has been as great as when their fairs were largely given up to racing and gambling.

DURING the last three months 1,446 horses, 67 donkeys and 5 mules, were killed in Paris for public consumption.

THE cattle melon, as our English cousins call the pumpkin, is grown to perfection in France. This year one was exhibited there weighing 400 pounds.

IF they want to pull 'em back, all the men in the world can't stop 'em.

Poultry Yard.

At Rest.

Now, all clucked home to their feather beds,
Are the velvety chicks of the downy heads.
In the old Dutch style, with the beds ah've,
All under the wings of a hovering love;
With a few clinked in, as plump as wrens,
Around the edge of the ruffled hens.

POULTRY FOR PROFIT.

CONFLICTING advice as to which breed of poultry is the best to keep for profit results in confusing the ideas of a new beginner in the business of poultry raising and egg producing. The persons who make a business of breeding fine fowls and have eggs and birds for sale, are frequently prejudiced in favor of or against some special variety, and there advice is, accordingly, liable to be unreliable. Every few years some particular breed is in fashion, and its popularity causes many to desire it above any other. In one decade it may be the Cochins or Brahmas, and in another the Leghorns, Hamburgs or Polands. Whatever it be, after a short run, some other sort is sure to supercede it. Each kind and variety of fowl has its special peculiarities which adapts it to certain conditions, under which it will do as well or better than any other sort would. Also there are fowls for the table and fowls for egg producing. The best fowl for the table will not be likely to be the best layer, and the abundant layers are not the best for the table. The heavy sorts, which mature early and fatten easily, and are not given to roaving, are the best where fowls are raised for market or for the table, especially if kept in small enclosures. On the other hand, where chickens are bred for eggs, and a wide range is supplied, the lighter and more active breeds, which are the best layers, should be chosen.

Some breeders advise keeping breeds of poultry pure—unmixed with other sorts. Others say that it increases the value of poultry, either as layers or for the table, to mix the breeds. We believe it depends much upon the hardiness of the breeds about that. Where poultry has been bred for years to fine points of any special sort, whether of color or form, regardless of hardy qualities and health, they are likely to become delicate, and in a word, run out, as the white face Black Spanish variety did, for instance. In this case it would be an advantage to them to cross in a little stronger blood from whatever source it might be. The Game Cock, which is bred for strength, health and endurance, is found to be an excellent blood to mix with fine or common fowls. On general principles, other things being equal, the hardiest and healthiest fowls are the best. In fact, they are the best anyhow; but for certain purposes fowls of such breeds as are, or seem to be best adapted to any given conditions, should be selected. The feeding has much to do with health and egg and poultry producing; also keeping them free from vermin, and giving an abundance of pure water and pure air day and night. All sickly hens should be at once removed from the flock. Better kill them at once than allow them to run among the others. Choose the strongest cocks for breeders, and use special efforts to keep your fowls healthy and you will be successful.

FEEDING FOWLS PEPPER.—I witnessed for the first time, at the late Crystal Palace bird show, the results of pepper feeding, and was greatly pleased, as well as surprised at the wonderful improvement in color of the different specimens so treated. I looked upon the treatment as fair and legitimate, and in no way deserving the name of a "trick," which, I am sorry to say, has been applied to it. Such a term of reproach should be reserved for all dishonest interference with the outside of competing birds, such as drawing, trimming or staining feathers. Whatever can be effected through the secreting organs of any bird cannot fairly be termed artificial or unnatural, unless everything be so named which differs from the mode of life and food of the bird in its original state. The object aimed at in the treatment of all domestic animals is an improvement upon their natural or wild state; and in the case of the canary bird, bred in confinement, cayenne pepper, voluntarily eaten, is no more unnatural to it than the egg and cake with which the show birds have been regularly fed for years. The system of moulting birds in close warm cages, feeding them at the same time on more stimulating food than simple seed, has long been recognized as a necessity where depth and richness of color are desired. The new mode of feeding on cayenne pepper is simply an extension of this rule; and whether discovered accidentally or as the result of an experiment, is, in my humble opinion, the greatest improvement in the treatment of our favorites that I have witnessed. If it could be shown that the health of the birds is injured by such food, there would be some grounds for objection on the score of cruelty; but as for all I could learn, such is not the case but rather the contrary. I, for one, hail the discovery with great satisfaction. Depth of color has been the point chiefly aimed at in many varieties of canary, and here it is, beyond the expectation of the oldest fanciers, and permanent or not, according to the continued treatment of the bird. I would, in conclusion, lay down one simple rule, viz: Put whatever you like inside the bird that it willingly takes without injury, but forbid, under the strictest penalties, any interference with the outside.—*Correspondent Poultry Review (England).*

HOW TO PET CANARIES.—Says a writer on canaries: "In this way I answer the question of 'how I had such luck with birds.' Simply by allowing the birds to attend to their own affairs, and by letting them understand that their mistress would not harm them. Also, by accustoming them to plenty of light and air and company, rather than, as commended in books, keeping the cage in a dark room for fear of frightening the birds. Make just half the fuss directed in bird books over the matter, and you will have double the success in raising the birds. Never give them sugar, but all the red pepper they can eat. It is the best thing for them. And if your bird feels hoarse at any time, put a piece of salt pork in the cage and see how the little fellow will enjoy it, and listen for the result. Give him flax-seed once in a while, and if he appears dumpy occasionally, give him a diet of bread and water with red pepper sprinkled in. Open the cage door and give your pets the freedom of the room. Soon they will come at your call and fly to meet you whenever your voice is heard. I had one who came regularly to my desk as I sat writing each day, and disputed, with fluttering wings and open beak, my humble right to the inkstand; and when I had reasoned him out of his mistaken notion, he would perch himself upon my penhaudle (no comfortable proceeding for me), and watch gravely as I wrote. I have also many times discovered him in the act of eating off the corners of my paper, even to the title of my article. Another thought nothing of trotting about on my head and shoulders, and even hopped under my throat to nestle against my chin. He would take his bath as I held the cup in my hand, and coolly dry himself on my head. Another would fly down or up stairs to me whenever I called him. He has welcomed my return by flying down stairs and singing at the top of his voice all the while, until, at last, perched on my shoulder, he would accompany me to my room."

SIGNS OF YOUNG FOWLS.—A young turkey has a smooth black leg; in an old one the legs are rough and reddish. In domestic fowls, the combs and the legs are smooth when the bird is young, and rough when it is old. The bills and the feet of geese are yellow and have few hairs upon them when the bird is young, but they are red if it be old. The feet of a goose are pliable when the bird is fresh killed, aud dry and stiff when it has been some time killed. Geese are called green till they are two or three months old. Ducks should be chosen by the feet, which should be supple, and they should also have a plump and hard breast. The feet of a tame duck are yellowish, those of a wild one reddish. If the rear end of the keel bone of a dressed fowl be elastic, so that you can bend it a trifle, it is a cerfain sign that the bird is not over a year old.

The *Poultry World* recommends cooked meat to be given to fowls generally over raw meat, as more nutritious and as making them less quarrelsome. Fish, it says, are always good as food, and when boiled are picked clean from the bones. Scraps from the chandlers, already cooked, are said to be excellent. It is well known that dogs are quite ferocious at times from being fed on raw meat.

"HAVE you any nice fresh farmer's eggs?" inquired a precise old lady at a grocery store. "No, ma'am," replied the practical clerk, "but we have some very good hen's eggs." She took three to try.

Apiary.

[From the American Bee Journal for January.]

The Southern California Bee Country.

IN the *American Bee Journal* for September, 1875, I noticed a communication over the signature of "G. F. M.," a few of the false statements in which I wish to contradict. I also wish to show up some inconsistencies and contradictions of the communication of "J.," who received a letter from a "prominent Kansas bee-keeper." By way of parenthesis, I will state that G. F. M. is located on one of the prettiest claims in the county of San Diego, just six miles from mine, and it is not a *"desert"* by any means. I am at a loss to understand how a man can state in his letter that a country is a "desert," and in the same letter state the fact that the country is "overrun with swifts, horned toads, snakes, ground squirrels, gophers, rabbits and quails." Query—What do they live on? I always supposed that sheep and cattle had to have grass, etc., to live on, and that thousands of sheep and cattle do live here, and live fat, too.

This G. F. M. cannot, with truth, deny.

Now as to some more of "J.'s" facts: "Some 500 or 600 miles," etc. It is 480 miles by sea from San Francisco to San Diego. I have traveled that whole distance overland on horseback on purpose to see the country. Fifty miles south of San Francisco is San Jose; the plain or valley surrounding which was thought, twenty years ago, by novices like G. F. M., to be a "desert." Now it cannot be bought for less than from $200 to $1,000 per acre, it now being under a high state of cultivation, and covered with vineyards and orchards and fruit of all kinds; and in the Fall of 1868 I saw hundreds of bushels of apples rotting on the ground, there being no market for them. Thirty miles south of San Jose is Gilroy, with a rich farming country surrounding it. Twenty miles south of this is Hollister, with the same. Between Gilroy and Hollister lies Soap Lake, out of which flows the Pajaro river, which "reaches the ocean" all the year round. Thirty miles south of Hollister is the valley of the Salinas river, which, for a portion of the year at least "reaches the ocean" in something besides a "dribble," perhaps(?). "J." knows more about that than I do.

The valley is a *rich* farming country and not a *desert*, "J." to the contrary notwithstanding. Next comes San Luis Obispo, with some more good farming country, the people of which would not thank "J." for publishing their county as a "*desert.*" Next comes Santa Barbara, the same. Then comes Ventura county, with just as good farming land as a man need live on. Next comes Los Angeles, with her thousands of acres of orange, lemon, lime, peach, pear, apricot, plum and prune orchards, as fine as any in the world; also her thousands of acres of vineyards, producing vast quantities of grapes, etc. Not much of a desert! The average corn crop of Los Nietos, Anaheim, Santa Ana and San Bernardino is from 80 to 100 bushels per acre.

When I refer to fruits and harvest fields, I *don't* mean a portion of the State 500 or 600 miles north of where I live, but I mean right here in San Diego county. Yesterday I saw a White Turkey fig tree three years old, without a drop of water put on it since it was set out, and not a thing done to it in the way of cultivation since the first season. This was frozen to the ground the first Winter, and yet I saw on it 113 figs.

Men who plant and sow here, and do it when and how it should be done, get just as good returns for their labor as in any of the Western states, where they are as far from market as we are here. *Good* men get just as good wages and as steady employment here as in any country I ever lived in, and I have lived in Pennsylvania, New York, Ohio, Indiana, Iowa and Missouri, and to-day I would not trade my little 160 acres for the best farm in either of those states, and be compelled to go there and live on it and work it myself, or hire it worked, for that matter. I am a carpenter and get $3.00 and board as the lowest price I work for. The statement that "masons they have no use for, as they don't build brick or stone houses on account of earthquakes," is simply laughable. In San Diego, Los Angeles and San Bernardino there are plenty of brick houses.

It is true that many of the bee men are living without women—"baching it"—but many more are not. The majority of settlers here have wives and families, and more would have if they could get them worth having. Good, marriageable white girls are not very plenty here. G. F. M. has just called in and I read this to him. We had quite a laugh over it. He confessed that he had the blues

when writing his letter, and probably wrote as he felt. He called my attention to a communication from M. M. Baldridge, in the July number of the *American Bee Journal*, in which it was stated that bees in Harbison hives could be bought for $2.50 per colony, etc. John Myers, a resident of Los Angeles, while at my house told me that he was offered a lot of bees for that price in exchange for cows, and made the rest of the statement as I gave it, and I supposed it true. It seems that the case was an exception.

One statement more of G. F. M.'s: "They can't raise a thing here farming," etc. O. Oakes, at Bernardino, raised over 3,000 sacks of wheat and barley and a large quantity of hay, how much I did not enquire. Benus Sikes also raised a large amount, and many others raised grain this year, and lots of grain is being shipped from San Diego this year, and a great deal was shipped away last year. We have no starvation here, nor have we been eaten out by grasshoppers, as they have in Kansas and other Western states. W. J. WHITNEY.

BERNARDINO, Cal.

MISCELLANEOUS.

WM. O'DONNELL

Wishes it known and distinctly understood that he has now on hand the

NURSERY BUSINESS,

But has now, and will continue to have, as fine a stock of Splendid Ornamental Plants, Shrubbery and Trees; also Fruit Trees of all kinds, as any Nursery in the State.

A FREE DEPOT

Has been opened on the corner of El Dorado and First streets, where O'DONNELL can be found with a full assortment of all the most desirable trees and plants of every discription, CHEAP FOR THE MILLION!

THE ZOOLOGICAL GARDENS,

Which he has established on his grounds as a Grand Summer Park, detract nothing from the NURSERY DEPARTMENT of his business, but all work in harmony. Next Spring he will offer for sale, near his Famous Gardens, a number of beautifully ornamented

LOTS FOR RESIDENCES,

But more about that anon. What is now of most interest to the public is the fact that O'DONNELL is selling all varieties of Superior Fruit and Ornamental Trees and Plants. Give him a call.

THE

CHICKERING PIANO

Has always taken the lead as a

FIRST CLASS INSTRUMENT!

But with all the

WONDERFUL IMPROVEMENTS

Recently made, it is considered, by good judges, to be

FAR IN ADVANCE

Of any Piano made on the whole face of the Earth!

☞ Their New style, Overstrung, Upright Piano contains improvements found in no other. Please call and examine.

SMITH & RYDER

(Dewitt Ryder), Agents,

100 First Street, Wilcox Block,

SAN JOSE.

Locke & Montague,

IMPORTERS AND DEALERS IN

Stoves, Pumps, Iron Pipe, Tinware &c.

112 and 114 Battery St.,

SAN FRANCISCO.

BANKS.

SAN JOSE SAVINGS BANK,

286 *Santa Clara Street.*

CAPITAL STOCK - - $600,000
Paid in Capital (Gold Coin) - $300,000

Officers:—President, John B. Moore; Vice-President, Cary Peebles; Cashier, H. H. Reynolds.

Directors:—John B. Moore, Dr. B. Bryant, S. A. Bishop, Dr. W. R. Stone, Cary Peebles, S. A. Clark, H. Messing.

NEW FEATURE:

This Bank issues "Deposit Receipts," bearing interest at 6, 8 and 10 percent per annum; interest payable promptly at the end of six months from date of deposit. The "Receipt" may be transferred by indorsement and the principle with interest paid to holder. Interest also allowed on Book Accounts, beginning at date of deposit. Our vaults are large and strong as any in the State, and specially adapted for the safe keeping of Bonds, Stocks, Papers, Jewelry, Silverware, Cash Boxes, &c., at trifling cost. Draw Exchange on San Francisco and New York, in Gold or Currency, at reasonable rates. Buy and sell Legal Tender Notes and transact a General Banking Business.

FARMERS' UNION.

(Successors to A. FRISTER & Co.)

SAN JOSE INSTITUTE

—AND—

BUSINESS COLLEGE!

A Day and Boarding School for Both Sexes.

THE SECOND SESSION OF THE CURRENT School Year will commence January 3d, 1876.

In acknowledging the kindness of the patrons of this School, the Proprietors desire to assure them that with the increased patronage will be added increased facilities for imparting instruction. They intend that the School shall offer the very best opportunities for acquiring thorough education, both theoretical and practical

The course of study in the Academic grade is extensive and thorough.

The Business College has no vacations.

Students from a distance will find pleasant rooms and board at reasonable prices at the boarding-house.

The Faculty accept to its fullest extent the growing demand of the industrial classes for recognition in the public educational system hailing it as the harbinger of a higher and better civilization.

ISAAC KINLEY,
Superintendent of the Institute.

JAMES VINSONHALER,
Principle of the Business College.

1776. CENTENNIAL 1876.

Chicago & Northwestern Railway.

Passengers for Chicago, Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their

Transcontinental Tickets via

CHICAGO & NORTHWESTERN RAILWAY

This is the BEST ROUTE EAST.

Its Track is of STEEL RAILS, and on it has been made the FASTEST time that has ever been MADE in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fort Wayne and Chicago and Pennsylvania Railways.

THROUGH TRAINS DAILY, WITH PALACE Cars through to Philadelphia and New York on each train.

THROUGH TRAIN, WITH PULLMAN PALace Cars to Baltimore and Washington.

Lake Shore and Michigan Southern Railway and Connections—New York Central & Erie Railroads.

THROUGH TRAIN DAILY, WITH PALACE Drawing Room and Sleeping Cars through New York.

Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways.

THROUGH TRAINS, WITH PULLMAN PALace Drawing Room and Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

Baltimore and Ohio Railroad.

THROUGH TRAINS DAILY, WITH PULLman Palace Cars through to Zanesville, Wheeling, Washington and Baltimore without change.

This is the **Shortest, Best** and only Rail running Pullman celebrated **Palace Sleeping Cars and Couches**; connecting with Union Pacific Railroad at **Omaha** and from the **West**, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for **Chicago and the East.**

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through cars to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento. Tickets for sale in all the Ticket Offices of the Central Pacific R. R. H. P. STANWOOD, General Agency, 121 Montgomery street, San Francisco.

MISCELLANEOUS.

THE TRUTH ABOUT

THE DAVIS

VERTICAL FEED

SHUTTLE SEWING MACHINE.

IT DOES NOT TAKE AN HOUR TO get it ready to do a minute's work, but is always ready in a minute to do a day's work.

The Favorite of the Family circle. Runs more easily and quietly than any other machine.

The DAVIS presents these advantages: It prevents fulling or gathering of goods, will sew over thick seams, or from one thickness to another, without change of stitch or tension, and make the most Elastic, Durable and Uniform Lock Stitch of any Machine before the public.

The only one having an Automatic Bobbin Winder, and the most wonderful attachment for making the Knife Pleating.

The peculiar feature of the DAVIS is its VERTICAL FEED, which is essentially different from any other Machine manufactured, requiring no acquired skill to operate it, nor lasting of the goods, and all should give it an examination at least before purchasing any other.

After six weeks' trial at the Franklin Institute Exhibition, held at Philadelphia in 1874, it was

Awarded the Grand Medal Against Nineteen Competitors!

And has universally been awarded the FIRST PREMIUM at all principal Fairs where exhibited.

We have the best manufacturing machine in use.

Energetic and responsible Agents wanted in all unoccupied territory.

For further information, circular and terms, call on or address

AGE OF BIRDS.—The eagle, raven, swan and parrot are each centenarians. An eagle kept in Vienna, died after a confinement of 114 years, and on an old oak in Shelborne, still known as the "raven tree," the same pair of ravens are believed to have lived their residence for a series of more than ninety years. Swans upon the river Thames, about whose ages there can be no mistake, since they are annually nicked by the Vintner's Company, under whose charge they have been for the last five centuries, have been known to survive 150 years and more. The melody of the dying swan is mythological. Upon approach of death the bird quits the water, sits down upon the bank, lays its head upon the ground, expands its wings a trifle and expires, uttering no sound.—*Ex.*

JOHN ROCK, San Jose.

A SUIT growing out of the purchase of a twenty-five cent package of turnip seed has just been finally decided by the New Jersey court of errors and appeals, after a litigation of six years. The seed was represented as producing early turnips, whereas the crop was a late one and poor at that. Hence, a suit for damages and a verdict of about one hundred dollars, although the defendants proved they had no intention of defrauding their customer. They appealed to the common pleas, to the supreme court and to the court of errors in succession, but the Justice's decision was sustained in every instance.

THOROUGHBRED SPANISH MERINOS
FOR SALE.

SIXTY ONE AND TWO YEARS OLD S—Thoroughbred Spanish Merino Rams, California bred, from Ewes imported from Vermont, and sired by Severance & Peel's celebrated ram FREMONT, and by their ram GREEN MOUNTAIN, which took the first premiums at the Bay District and State Fairs. Last shearing, 35¾ lbs. year's growth. Also, about 100 Ewes and Lambs, all of GREEN MOUNTAIN stock, bred last year.

B. F. WATKINS, Santa Clara, Cal.

THE slickens question is getting to be serious. The farmers along the banks of the Yuba have held more than one meeting for the discussion of this very grave question. They seem to think that their lands will be ruined, if hydraulic mining goes on as it is now going on, by depositing sand and gravel (they call it "slickens") on their fields.

A METHOD of curing skins without removing the hair is given by a correspondent in the *Fancier's Journal:* Take about ten gallons of soft water, one-half bushel of wheat bran, seven pounds of sulphuric acid; dissolve all together and put the skins in the solution and allow them to remain twelve hours; take them out and clean them well and again immerse twelve hours more, or longer, if necessary. The skins may then be taken out, well washed and dried. They can be beaten oft, if desired.

ALFALFA is perennial in the strictest sense of the term. A single planting will endure for a quarter of a century, or, for that matter, forever, and the yield is simply astonishing. Year after year the well attended alfalfa will yield its twelve and twenty tons of hay, in monthly or quarterly cuttings. Whether pastured, or fed green or cured, it affords a most healthy and nutritious diet for all kinds of stock. The sheep, the hog, the milch cow and the horse thrive upon this luxuriant grass and require but little grain.

THE CAL. AGRICULTURIST PUB. CO. have constituted themselves a **Purchasing Agency,** to accommodate AGRICULTURIST subscribers. Anything wanted in San Jose or San Francisco purchased at lowest rates for cash, and forwarded to order **Free of Commission.**

THE CAL. AGRICULTURIST PUB. CO.

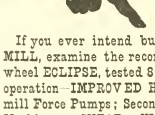
ANNOUNCE TO SUBSCRIBERS OF THE "AGRICULTURIST" that they have made arrangements whereby they can supply almost any desirable book published upon any subject, at publishers' prices, postpaid, upon receipt of its price. People living in the country, away from book stores, have experienced difficulty in getting what books they want at any price, and are frequently imposed upon when they do get books. Now, we propose to remedy this matter entirely, and without further trouble to our patrons than the sending of their orders, accompanied with the cash, to select the book they want, and send it to them at publishers' own price, free of other costs. Our arrangements are fully perfected, and we mean business! We shall continue our Catalogue of good books from time to time, adding the most desirable books published.

IMPORTANT TO SUBSCRIBERS.

We have made further arrangements so that we can offer PREMIUMS or BOOKS for every prepaid subscription, to old and new subscribers alike; and to every person who solicits subscriptions we give extra premiums of his own choosing. Our premium rates are as follows: Upon each $1.50 subscription, prepaid for 1876, we credit to account of subscriber 50 cents reckoned in his favor upon an order for books to the amount of $2. For three cents, after paying for 1876, upon receiving an order for any book or books at any time worth $4, only $1.50 in coin need be sent. This, added to the 50 cents to his credit, will pay for the books. Persons who, at the time of paying their subscriptions do not order books, or who order but a part of what they want at once, will be entitled to the benefits of OUR PREMIUMS AND REDUCTIONS whenever they choose to take advantage of it, at any time during the continuance of their Subscriptions.

TO SOLICITORS.

The agent sending us four subscriptions with $6 (the bare subscription price), will be entitled to $2 worth of books, his own choice, without further remittance. This gives every young man or woman a chance to get all the reading they want WITHOUT cost, and to the subscriber a chance to get books BELOW cost. We are sure that no better opportunity was ever offered to the public on this coast to obtain good reading. The AGRICULTURIST, greatly improved for 1876, will be worth more than the subscription price, which is within the reach of every one's means, and our arrangements shall reach every home on the Pacific Slope, and while we propose to be liberal towards all of our subscribers, we hope to be favored by the efforts and good will of each and every reader of good books, and of the CALIFORNIA AGRICULTURIST.



WIND AND WATER.

If you ever intend buying a **WIND MILL,** examine the record of the solid-wheel **ECLIPSE,** tested 8 years; 3500 in operation—**IMPROVED** Hand or Wind-mill Force Pumps; Second-hand STEAM Machinery; CHEAP. Write me for circulars, or call. CHAS. P. HOAG, 118 Beale St., San Francisco.

Are the Best the world produces. They are planted by a million people in America, and the result is beautiful Flowers and splendid Vegetables. A Priced Catalogue sent free to all who enclose the postage—1 two cent stamp.

Vick's Floral Guide, Quarterly, 25 cents a year. **Vick's Flower and Vegetable Garden** 2 cents, with cloth covers, 65 cents. Address,

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

ONLY 25 CENTS.

Comfortable Combination Clothing.

THIS STYLE OF UNDERCLOTHING FOR Ladies has been found by all who have used it, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying at the San Jose agency, **California Agriculturist Office**, (where samples can be seen,) or by addressing

C. C. C. Company,

Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. It is the invention of a California lady who makes every pattern her elf and writes full directions upon each. No family that once tries this style of clothing will ever go back to the others.

Closing Out Stock

THE SUBSCRIBERS, INTENDING TO CLOSE up their business with as little delay as possible, now offer their stock of

BREEDERS' DIRECTORY.

Parties desiring to purchase Live Stock will find in this Directory the names of some of the most reliable Breeders.

OUR RATES.—Cards of two lines or less will be inserted in this Directory at the rate of 50 cents per month, payable annually.

A line will average about seven words. Count five words for the first Hoe.

CATTLE.

S. B. EMERSON, Mountain View, Santa Clara County, Cal.—Breeder of Short-Horn and Holstein Cattle and Cotswold Sheep.

CYRUS JONES & CO., San Jose, Santa Clara County, Cal.—Breeders of Short-Horn Cattle. "Young Bulls for sale."

CHARLES CLARK, Milpitas, Santa Clara County, Cal.—Breeder of Short-Horn Cattle and Swine.

COLEMAN YOUNGER, San Jose, Santa Clara County, Cal.—Breeder of Short-Horn Cattle.

C. R. POLHEMUS, San Jose, Santa Clara County, Cal.—Breeder of Short-Horn Cattle.

CARR & CHAPMAN, Gabilan, Monterey County, Cal.—Breeders of Trotting Horses, Short-Horn Cattle and Swine.

W. L. OVERHISER, Stockton, San Joaquin County, Cal.—Breeder of Short-Horn Cattle and Swine.

MOSES WICK, Oroville, Butte County, Cal.—Breeder of Short-Horn Cattle.

SHEEP AND GOATS.

C. P. BAILEY, San Jose Cal.—Importer, breeder, and dealer in Cashmere or Angora Goats. Fine Pure-bred and Grade Goats for sale.

LENDRUM & ROGERS, Watsonville, Cal.—Importers and breeders of the finest Cotswold Sheep and Angora Goats.

MCCRACKEN & LEWIS, San Jose, Cal.—Importers and breeders of fine Angora Goats; also, fine Cotswold graded bucks for sale.

MRS. ROBERT BLACOW, Centerville, near Niles Station, Alameda County, Cal.—Pure-blooded French Merino Rams and Ewes for sale.

LENDRUM & ROGERS, Watsonville, Cal.—Importers and breeders of Pure Angora Goats.

SWINE.

CHARLES CLARK, Milpitas, Santa Clara County, Cal.—Breeder of Pure-bred Berkshire Swine.

POULTRY.

MRS. L. J. WATKINS, Santa Clara—Premium Fowls. White and Brown Leghorn, S. S. Hamburgh, Brahmas, B. B. Red Game, Game Bantams, and Aylesbury Ducks. Also, Eggs.

MISCELLANEOUS.

S. HARRIS HERRING, San Jose, Cal.—Agent for several breeders of Best Pure-bred animals and poultry. We bring the breeder and purchaser together direct, and do not stand between them, while we add each free of charge.

SPLENDID CARD PHOTOGRAPHS, only $2 a dozen, and Cabinets $4 a dozen, at HOWLAND'S Gallery (Heering's old stand) No. 359 First st., San Jose.

WALLACE & COCHRAN, 386 First street.—Handsome turnouts always on hand at fair prices. Fine Hearse for Funerals. Carriages for sale. Give us a trial.

H. S. LAMKIN,
ATTORNEY-AT-LAW—ROOMS 3 AND 4, Stone's Building (opposite Auzerais House), Santa Clara street, San Jose.

DR. J. BRADFORD COX,
OFFICE OVER T. W. SPRING'S STORE, opposite the Post Office, San Jose.

☞ The National Gold Medal was awarded to Bradley & Bulofson for the best Photographs in the United States, and the Vienna medal for the best in the world.
429 Montgomery street, San Francisco.

LETTER FROM ITALY.

BY JAMES S. LIPPINCOTT.

S. Harris Herring, Esq.: While passing through this land of vines we have often been reminded of scenes in the Occident, and many a time have memories of San Jose come up vividly before us. Two weeks at Vevay, near the head of Lake Geneva, in Switzerland, were especially agreeable, the wine harvest being at its hight.

Unlike California in almost every other respect though Switzerland may be, in the abundance and excellence of her grapes, pears and plums, grown upon the hills that border her lakes, she rivals even your young and sunny land. Such an overwhelming abundance of sweet blue plums and Grand Duchess and other pears, I never before witnessed; while the crop of grapes was so vast as to greatly exercise the ingenuity of the proprietors and text the capacity of their vaults, to afford space wherein to bestow the vintage.

Picture to yourself the northern slope of the lake side for twenty-five miles in length, and from one-quarter to one-half a mile wide, covered almost entirely with vineyards, terrace upon terrace, with walls from five to twenty feet in hight, supporting the earth at wide intervals, with here and there a stately homestead, a fine chateau, or ancient tower, while broad-armed walnut trees, or thrifty orchards, or avenues of sycamores are thrown in to diversify the scene. Higher up the slope appear meadows and orchards and compact villages on streets so narrow that carriages can barely pass each other, while before or beside each house stands the ever-present manure heap, reeking with foul vapors and waters. The almost universal presence of this hope of the future, gives a characteristic scent to Switzerland—the smell of the cow yard—which, owing to the manner in which the fertilizing liquid is applied, is a universal nuisance, detracting from the pleasure with which one would otherwise regard many a beautiful scene by positively thrusting itself upon the unwilling attention and filling the sensitive with disgust.

Swiss houses are generally lumbered around with balconies loaded with wood or faggots of vine-trimmings and bean haulm, and almost every one has the under side of the balcony or outside gallery ornamented with festoons of yellow Indian corn hanging in close files from the twisted husks on very long poles, tier upon tier, for the American corn-crib is unknown among them.

Above these dirty villages, each house of which is a picture in itself, sometimes painted by some ardent young village artist in vigorous designs, rise the meadows and the rougher slopes, and soon the groves of pines and firs usurp the soil, which has become very thin; while beyond the precipitous rocks look down in their grey barrenness or thrust their sharp peaks above the lower clouds. Before we left, the early snows had powdered their scalps, and on our departure the highest mountain tops and far down towards their bases were covered with snow, which, in the morning light, added another element of beauty to that which before was lovely; and when the evening glow lighted the summits into phosphorescent brilliance, they became gloriously beautiful with the tints of pale rose and violet, to die into the dun of twilight and the sombre of the evening shades.

The vintage is here *the* industry in which all classes are interested, as upon its prosperity depends much of the wealth of the people. To it they give themselves with an enthusiasm which is quite catching, and we temperance advocates entered into the spirit of the occasion with a zest we were not aware could have been awakened in us.

The city of Vevay, like many other southern cities which have endured the trials of war, has the lower story of its houses, in many instances, constructed in a massive manner, and entered through large arched doorways. This story, though above ground, is heavily vaulted, and serves as a depository for wines and for the mills and presses and scene of manufacturing.

Let me attempt a description of a day at Vevay among the grapes: You must be informed that the Swiss are the most industrious and toilsome of laborers—not even your Chinese can excel them, I imagine. Men, women and children here perform an amount and kind of labor that would be scarcely credible to your easy-going Californians. One may see masons propelling wagons loaded with masses of stone that would make a load for two horses, and which American laborers would not touch with even a hand. Groups of six or eight washerwomen in lively chat may, morning and evening, be seen and heard pushing a vehicle loaded with linen to or from the lake, where the washing is daily enacted, and where the western order of things is reversed; for the washerwoman usurps the place of the soapsuds and clothing, and taking her stand in the tub, punches and slaps the clothes around with a long pole, which she dextrously wields. But the manner in which smaller burdens are carried by the peasants is curious. The Vaudois appear to consider their toilet incomplete unless they are furnished with the *hotte*. This *hotte*, or hod is fitted to their backs, and it is evident that their backs are early fitted to the *hotte*, for groups of children daily appear in the streets upon whose backs this unseemly appendage is strapped, and in which they carry bread, grapes, chips and even their schoolbooks on their way to and from these abounding safeguards of their liberties. This *hotte* is a long, oval basket or light wooden vessel tapering towards its base, and attached to the back by means of straps through which the arms are passed, and affords the most convenient method of carrying burdens in this land of steep declivities.

But to the vintage—that joyous scene, into which so many entered with interest that the schools were adjourned, so that young and old might assist therein. The hillsides, as far as we could see, were alive with grape-gatherers, among whom young women were most numerous, and the streets were thronged with singular vehicles, upon each of which was fastened, lengthwise, a hogshead or pipe loaded with crushed grapes on their way to the mill and adjacent press in the vaults of the city proprietor. The grapes were cut from the vines by means of small, sickle-shaped knives, thrown into baskets and emptied into large wooden hods in the vineyard, where they were smashed by means of a plunger or pestle in the hands of a strong man, who bore the full hod to the gate of the vineyard and emptied it by pouring its contents over his head into a hogshead upon the wagon that bore it down hill to the press. Every vehicle that the city could muster, capable of bearing the burden of a hogshead, seemed brought into service, and a most incongruous assemblage of beasts harnessed thereto, from spavined old steeds to noble teams of draught horses, grand old bulls, well-worn mules, placid cows and the omnipresent, patient and all-enduring donkey.

Our landlord having invited us to visit his vineyard and help ourselves, we accepted with pleasure. We climbed up the steep hillside, wound about between the walls bounding the narrow pathways, and at length found ourselves among a group of grape-gatherers, each busy with her sickle-knife upon the large bunches of sweet amber grapes. We plucked and ate, and though our capacity did not equal that of our host, which he asserted was eight pounds, we left that vineyard glad of heart but heavier than when we entered it. No injurious effects follow a very generous consumption of grapes, and several grape-cures have been opened in this district, where patients are encouraged to consume them in almost unmeasured quantities, morning, noon and night, and with excellent results. We partook abundantly during our two weeks' tarriance at Vevay, and can say that our health has not been better at any time during our travels in Europe.

Florence, Italy, December, 1875.

IN A NUT SHELL.

The people are as completely slaves to a pernicious financial system, in the United States, to-day, as ever were the negroes in the South to their owners. The unjust and outrageous national bank act costs the people thirty millions of dollars every year for individual bank notes not as good as greenbacks! The Government pays interest on money she should have issued herself, without paying interest, and might be drawing interest on as well as not, instead of paying it out as is now the case.

The greenbacks were a mistake in not being made payable for everything instead of excepting "interest on the public debt and duties on imports." Then there would have been no discount necessary.

We believe in paper money, but think it should be issued only by the Government, and paid out by the Government only for value received, or on good security, and should *draw a very small interest*, to cover the necessary expenses of the business, instead of paying interest. The property of each State, county and township, and individual to whom the money might be issued should be held by pledge for the payment of interest and return of money or its value. Such a system would be simple, just, economical and practical. It would give no bankers power to extort enormous rates of interest, would encourage instead of kill industrial enterprises; everyone could be employed in producing, and everyone could secure the comforts and luxurious of life. Money would be a servant instead of a king. The money kings would find their speculative occupations gone, and could become useful citizens, instead of parasites to suck the people's and the nation's blood. Mining stocks and swindles could be dispensed with as worse than useless. The actual wealth and honor of the people only would be at stake, and upon that should be based the circulating medium called money. And the less the actual cost of the medium, the greater the benefit to the people.

MODELS OF HUMANE INVENTIONS WANTED.

The Massachusetts Society for the Prevention of Cruelty to Animals is endeavoring to collect models of every invention for the comfort of animals. The organ of the society, *Our Dumb Animals*, published at the office of the Society, No. 168 Washington street, Boston, thus announces:

In order to show the progress of humane sentiments in regard to the treatment of animals, we propose to introduce into the Centennial Exhibition, models of such inventions as are calculated to relieve animals from suffering.

We therefore request inventors, or owners of such inventions, to send models to our office, on or before the last day of March, with such description as may seem necessary.

These will include horse and ox harness—collars, bits and substitute; bridles, breastplates, horse-shoes, coops, birdhouses, interfering and other pads, whiffletrees, and any other parts of harness or vehicle which contribute to the relief of animals, cattle-cars, calf-racks, in fact, angthing which fitly represents the idea that animals should not be subjected to unnecessary suffering.

These models should be as small as they can be.

Wash for Fruit Trees.—The *Practical Farmer*, speaking of a wash for bodies of fruit trees, recommends the following: One ounce of copperas to eight or ten gallons of water, forms a good wash, and is advised for trial as a preventive against blight. One pound of bleacher's soda and one gallon of water forms a wash that cleans off all insects, and leaves the trees with fresh, young-looking, healthy bark.

EDITORIAL NOTES.

Every farmer who has cultivated a hill side has experienced more or less trouble by the washing away of fine plowed and cultivated soil, during the season of heavy rains. Mr. Burrell, who owns land in the Santa Cruz mountains, tells us that he does not cultivate his side hills during the rainy season, but allows the grass and weeds to grow until danger of heavy rains is over. The settled soil is held by the roots and *debris* from washing away. Then, in spring, he turns under the green crop, and aims to leave the soil, after cropping, in such condition in the fall as to not wash away during winter.

We lately noticed J. Q. A. Ballou, an experienced orchardist, pruning his fruit trees in such a way as, in our opinion, to greatly lessen their value. The trees were very tall and straight, and he was cutting out the lower limbs and spurs from the inside of the plum and pear trees. The excuse seemed to be that the fruit growing on the lower inside limbs was always inferior. We believe the fault is in allowing so tall a growth, that the fruit grows near the end limbs the best. His system of pruning will cause the trees to produce finest fruit no where else but at the ends of the tall, top limbs. We should, in this case, have shortened in the top *one-fourth to one-third* the distance to the ground, and encouraged a healthy lower growth throughout the head of the tree. The tree would then bear its fruit nearer within reach, be in better proportion, and produce more good fruit than when growing so tall and thin a head. Our object in making this criticism is to bring out the ideas of others. There must be a right way and a wrong way. Of course experience is the best teacher, and the best method must, in the end, produce the best results.

Specie Basis.—The recent attempt to discount silver coin of the United States, on this coast, proves, if it proves anything, that a specie currency is no safer from the machinations of brokers than paper money. In fact, a paper currency properly issued—in the interests of, and backed up by the wealth and honor of the people—would be so stable as to be absolutely beyond the power of any combination of brokers to disturb. The excuse for the present discount on silver is, that it is too abundant. Never since we have been on this coast—now twenty years—has money of all kinds been so hard to command as at the present time. The fact is, our money dealers are determined to tax the industry of the people just as long and in as many ways as they will stand it. The matter is so maneuvered that every cent of discount has to come either directly or indirectly out of industry—a one-sided game, at which the stake-holders win.

A Good Step in the Right Direction.—Rev. Jubez Walker, G. W. C. T. of the Good Templars, Geo. Bramall, G. W. P. of Sons of Temperance, and other leading men have counseled together in the matter of legislation on the liquor question. The result is the following circular and petition, asking that the power to grant or withhold license to retail intoxicants be vested in the supervisors of each county. We hope it will succeed. The lovers of morality and good order can then be heard by way of remonstrance in each or all cases. We hope every town in our county will join all other places in sending on such a petion, numerously signed. This should be done at once. Petitions to be sent to Geo. B. Katzenstein, Sacramento, who will see that they are properly presented in good season:

To the Honorable, the Senate and Assembly of the State of California.

We, the undersigned citizens of the State of California, County of ——, respectfully petition your honorable body to enact a law giving greater protection to ourselves and the State from the abuse of the present system of indiscriminately granting license for the sale of intoxicating liquors by retail, by enacting that the power to grant or withhold license for the sale of intoxicating liquors be placed in the hands of the supervisors of each county, respectively, in the State. And your petitioners ever pray.

This is the age of rings and monopolies. When a thing can no longer stand on its own merits, if there is money in it, an attempt is made to bolster it up and force in some way a respectable recognition and support. The most ridiculous attempt at this sort of game that has for some time come under our notice is that made by the alopathic school of medical practice—the drug doctors. Because there are other schools of practice which discard their drugs; because, as people become more intelligent and better informed upon health subjects the more likely they are to think and choose for themselves, and consequently discard dug medication, which has killed and injured more persons than all other diseases together; because, while free to choose, people will employ such physicians as they believe to practice more in accordance with the laws of health—these alopaths desire to get a law condemning as quacks all persons not holding diplomas from their particular schools, and making such "quackery" a crime punishable by law. We can compare this outrage upon the sense of a free and enlightened people with nothing excepting the old religious intolerances which existed when people began to question the power of churches and priests. We don't expect the matter will result in such bloody wars now as then, but hope these medical bigots, who have martyred millions with their poisonous drugs in the name of science, will be soon placed where they belong—among the fossilized rubbish of the past. Should they succeed in passing such a law as they are now anxious for, their doom would be sealed all the sooner; for, surely, as the people discuss this subject and feel that their own rights, intelligence and liberties are subverted, they will break from such a "practice" and cause even the drug doctors themselves to become converts to a system nearer in accordance with natural hygienic principles.

ORCHARD GRAFTING.

A farmer who says that he followed our advice and directions for grafting last year with splendid success, although he had never grafted a tree before, requests us to repeat the article this year, as it must benefit everyone who has trees that need grafting if they will but give proper heed.

Grafting is a simple process, easy to understand and to do. It is something that every boy should learn how to do, and anyone can be successful with using proper care. There are several methods of grafting and budding, but the same principle, viz., uniting the vital saps under the bark of stalk and scion, is always involved. The only question is the best method of doing the work. Practice has determined this; at any rate, to a conclusion with us. In this article we will give the directions only for grafting standing trees.

For grafting orchard trees we find it much betters to apply the grafting wax liquid than plastic; and in order to do this and have the wax acquire proper consistency and hardness after application, we melt the wax in any vessel that is handy to carry, and apply warm, with a flat brush. The brush should be about one inch wide. We found it most convenient, where we had to use the wax constantly, to have a lamp burning under a vessel near by, where we could replenish the wax we carried in a smaller dish as often as we found necessary. A lard can may be used as a lantern to set the lamp in, and be attached to the bottom of the vessel of wax so as to br handy to carry.

For grafting wax, take half as much bees' wax as resin, and half as much tallow, lard or oil as bees' wax. When to be applied warm, it needs no working other than to be stirred and melted together.

It is better to cut scions some time before grafting especially when the grafting is deferred until late in the season. They can be preserved by healing them into the soil in a shady place. During this month the scions may safely be put in the same day they are cut.

In sawing off large limbs, always saw in on the under side of the limb first, then when you saw from the upper side there is less danger of splitting. We use a sharp, fine saw, and cut off all the limbs on the tree where we wish to graft them.

We use a knife of steel, four inches long on the edge (the cutting side quite concave), with a wedge on the outer end one and a half inches long, to insert in the split while we insert the scion. In large stalks we put in two scions—one on each side of the split—and in very large stalks two splits and four scions.

The scions should be prepared three to six inches long. Cut the wedge end long and straight, leaving the outside of the bevel thicker than the inside, and with a bud, when convenient, as nearly in the center of the outside of the scion as you can, and insert the scion so that the inner bark and saps (libers) come exactly together. Be careful in putting on the wax to cover every part of the wound to exclude the air—even the top of the scion should be touched with wax.

The first year allow all the sprouts and succers to grow, cutting off nothing until next winter. The removing of all the limbs deprives the tree of leaf-producing surface, and it will need all the leaves it can produce on all the sprouts the first year to keep it healthy. Shade the trunk of the tree, either with boards or by winding sacks about it, as the sun will be likely to scald the exposed bark. This is quite important.

We have had good success in grafting in California as early as the last of December, but if scions are properly preserved so as not to swell the buds too much, grafting may be done as late as the last of April, on most soils. On dry soils, early grafting is the best. Stone fruits should be grafted early.

Grafting is something that any person of intelligence and self-confidence can easily do. And anyone with an orchard that does not produce the kinds of fruit desired should not delay, but at once graft the trees, or get some one else to do it, to the best varieties adapted to our climate. For best varieties for a family orchard, see the AGRICULTURIST for December.

RAIN ON THE MOUNTAINS AND IN THE VALLEY.

ED. AGRICULTURIST: We are in the Santa Cruz mountains, about five miles due north from the city of Santa Cruz. The rain-fall here is heavy, as is shown by the following amounts taken from my record, which has been very carefully kept:

No. of Rainy Days.	Inches of Rain.
November.....13	18.56
December.....7	5.85
January.....14	15.58
Total... 34	39.60
Adding amount for Feb. 7 and 8	5.03
	45.02

In the town of Santa Cruz the amount up to the last of January was 27.06—nearly 12 inches less than here in the hills.

The people of your valley, with their meagre amount, often not sufficient for fair crops, can hardly realize how copiously it is poured down upon us "good folks," just out of sight, over the Santa Cruz ridge. As the rain clouds come drifting in from the ocean they encounter these mountains, and are turned upwards into the colder regions, where their vapors condense and fall; thus giving us too much, and your valley not enough. This is, to say the least, a very unneighborly arrangement; and if the cutting down of our forests would, as many predict, send more rain over to your thirsty valley, I, for one, could not object—much as I prize every one of these noble trees. But this old theory is still in dispute among scientific men. In all general storms, when we get the bulk of our rain, the clouds extend from one to five miles high, and it seems scarcely possible that the forests upon the mountain sides have much, if any, influence upon them.

D. M. LOCKE.

Springvale Farm, Santa Cruz, Feb. 9.

The rain fall in San Jose for the season, up to February 12th, the last rain, was 15 inches.

Poetry.

People Will Talk.

We may get through the world, but 'twill be very slow,
If we listen to all that is said as we go,
We'll be worried and fretted, and kept in a stew,
For nodlesome tongues must have something to do,
For people will talk.

If quiet and modest, you'll have it presumed
That your humble position is only assumed;
You're a wolf in sheep's clothing, or else you're a fool,
But don't get excited, keep perfectly cool,
For people will talk.

If generous and noble, they'll vent out their spleen,
You'll hear some loud hints that you're selfish and mean;
If upright and honest, and fair as the day,
They'll call you a rogue, in a sly, sneaking way,
For people will talk.

And then if you show the least boldness of heart,
Or a slight inclination to take your own part,
They will call you an upstart, conceited and vain,
But keep straight ahead, don't stop to explain,
For people will talk.

If threadbare your cost, or old-fashioned your hat,
Some one, of course, will take notice of that,
And hint rather strong that you can't pay your way,
But don't get excited, whatever they say,
For people will talk.

If you dress in the fashion, don't think to escape,
For they criticise then, in a different shape;
You're ahead of your means, or the tailor's not paid;
But mind your own business, there's naught to be made,
For people will talk.

If a fellow but chance to wink at a girl,
How the gossips will talk and their scandal unfurl,
They'll canvass your wants, and talk of your means,
And declare you're engaged to a chit in her teens
For people will talk.

They'll talk me before, but then at your back
Of venom and slander there's never a lack;
How kind and polite in all that they say,
But bitter as gall when you're out of the way,
For people will talk.

The best way to do, is to do as you please,
For your mind, if you have one, will then be at ease;
Of course, you will meet with all sorts of abuse,
But don't think to stop them, it ain't any use,
For people will talk.

Better Than Gold.

Better than gold is a conscience clear,
Though toiling for bread in an humble sphere,
Doubly blest with content and health,
Untired by the lust of cares of wealth.
Lowly living and lofty thought
Adorn and ennoble a poor man's cot—
For man and morals, on nature's plan,
Are the genuine test of a gentleman.

Better than gold is the sweet repose
Of the sons of toil, when their labors close;
Better the child is a poor man's sleep,
And the balm that drops on his slumbers deep.
Bring sleepy draughts to the downy bed,
Where luxury pillows his aching head;
His simpler opiate labor deems
A shorter road to the land of dreams.

Better than gold is a thinking mind,
That in the realm of books can find
A treasure surpassing Australian ore,
And live with the great and good of yore.
A heart that can feel for a neighbor's woe,
And share his joys with a genial glow;
With sympathies large enough to enfold
All men as brothers—is better than gold.

Better than gold is a peaceful home,
Where all the fireside charities come—
The shrine of love and the heaven of life,
Hallowed by mother, or sister, or wife.
However humble the soul may be,
Or tired by sorrow with heaven's decree,
The blessings that never were bought or sold,
And centre there, are better than gold.

An honest old farmer, on being informed the other day that one of his neighbors owned him a grudge, growled out, No matter; he never pays anything.

The Song of 1876.

BY BAYARD TAYLOR.

Waken, voice of the land's devotion!
Spirit of Freedom, awaken all!
Ring, ye shores, to the Song of Ocean,
Rivers, answer, and mountains, call!
The golden day has come;
Let every tongue be dumb,
That sounded its malice, or murmured its fears;
She hath won her story;
She wears her glory;
We crown her the Land of a Hundred Years.

Out of darkness and toil and danger
Into the light of Victory's day,
Help to the weak and home to the stranger,
Freedom to all, she hath held her way.
Now Europe's orphans rest
Upon her mother breast;
The voices of nations are heard in the cheers
That shall cast upon her
New love and honor,
And crown her the Queen of a Hundred Years.

North and South, we are met as brothers;
East and West, we are wedded as one!
Right of each shall secure our mother's;
Child of each is her faithful son!
We give thee heart and hand,
Our glorious native land,
For battle has tried thee and time endears;
We will write thy story,
And keep thy glory
As pure as of old for a Thousand Years.

Advice to Young Men.

BY ANNA LINDEN.

Stand nobly up and face life's work
With brave and honest soul,
And let no false and foolish pride
Your manly heart control.
Stand out in honest, bold relief—
A worker and a man;
Something of use in this great world,
After your Maker's plan.

* * * * * * *

'Tis good to see the honest face
And stalwart, manly frame,
With muscles that bespeak of strength,
And hands to match the same—
Hands that look competent to grasp
And grapple with life's foes,
And cause the barren wilderness
To blossom as the rose.

Ashamed of labor! No, not you,
Since that was God's decree;
For honest and industrious toil
Brings glad prosperity.
It frames and builds up all the good
A nation's life can know—
Science, and art, and fame, and wealth;
From work and effort grow.

Spurn indolence, whose weakening grasp
Blights manliness and worth;
Be something to yourself and friends;

AQUARIUM AND STAND.

Care for All.

BY FREDERICK T. CLARK.

There never has been a life
But has had its share of strife:—
Finding thorns among life's flowers,
Branches in its strongest towers,
Cruel stones around the feet,
And bitterness with all the sweet.

There has never been a heart
But has felt pain's cruel dart
Through its choicest treasures cleave,
Sure and quick, and only leave
Of our fond and clinging trust
Heaps of faded, lifeless dust.

Every life must have its care;
Every heart must have its share
Of the bitterness of earth
To appreciate God's worth.
Through the winter's cruel blight
Come the blossoms, pure and white.

Men consume too much food and too little pure air. They take too much medicine and too little exercise.

Be useful to the earth.
Make labor noble in itself
By being nobly done,
And make fair Nature's heart rejoice
To own you as her son.

Work is most noble, good and grand,
Since God ordained it so;
It keeps the heart from cankering rust
And makes the nation grow.
The workers are the nation's wealth,
And not the idle drones.
Work makes the country prosperous,
Makes happy hearts and homes.

It matters not if hands and brains
Are all your stock of wealth;
With steady, patient industry,
And energy and health,
You yet may rise to lofty hights,
As others have before,
And crown the throne of wealth and fame
With one brave victor more.

DISSOLVED SALT FOR THE TABLE.—The best way to use table salt is said to be to dissolve it in water and keep it in a bottle in a fluid state, using it as you would pepper sauce through a quill in the cork. The Chinese use it in that manner.

The Vineyard.

THE PHYLLOXERA.

We have written nothing about this insect before for the very reason that we knew very little about it. We were aware of the destruction it had caused to grapevines in Europe, and also that its appearance in California had filled viniculturists with much alarm, and that speculation is rife as to the possibilities of its ravages and the methods for exterminating the pest, preventing its spread, etc. We have carefully read everything we could find bearing upon the question.

It seems that these minute insects infest the roots of the grape plant, something as do the woolly aphis the roots of apple trees, only the phylloxera cover the entire bark of the roots as a scale, even to the far-reaching and smallest fibrous roots. This insect injures the vine by feeding upon the juices of the plant which it sucks through the bark. Hence the roots covered with the tenderest bark are preferred by them, and it is impossible to destroy them by the application of any poison that does not reach to the very ends of the roots. This being the case, and it being impracticable to so apply poisons, all efforts to destroy them by poisoning have failed. Immense sums of money have been offered for the discovery of some potent remedy, but without the desired result. However, it has been found that the pest can be drowned by flooding the vineyards for several weeks at a time with water. This process is not injurious to the vines if applied any time during the winter months when the vines are not in leaf. This remedy is probably the only effectual one, and is good enough where water can be so used. Vines growing upon hillsides of course cannot be so flooded, unless it be found that ditches filled with water between the rows and about the vines will answer the same purpose.

It appears that the phylloxera works worse ravages in dry soils than in wet, so that in California it will, unless checked in some way, prove very destructive on all soils that are not occasionally flooded. Persons who contemplate planting vineyards should bear in mind the necessity of selecting ground that can be flooded, or of bringing water upon it for that purpose.

It is said that the phylloxera is indigenous to the United States, and has been known upon the native grapevines in the East for many years, and that the insect is not destructive to the native varieties. Grapes that grow along streams and the banks of ponds, where the roots are below the water level, are not troubled with the pest. It is in just such places that wild grapes grow in the greatest profusion. The following, from the *Ohio Farmer*, is a summing up of about all that is of practical utility as far as is at present known:

Our French correspondent, in his last letter, thus speaks of the phylloxera, its ravages and the remedy proposed:

The importance of the vine-bug or phylloxera question to France may be estimated by the fact that the insect, which covers the roots like a bark, has already destroyed nearly half a million acres of vineyard, and threatens with ruin two millions of acres more. Since three years a government commission has been occupied at Montpelier in experimenting with all suggested remedies on an affected vineyard several acres in extent. It may be safely said that the commission, composed of practical and scientific men, has discovered no cure.

It has, however, demonstrated the happy action of manures in prolonging the life of the vine, though without preserving it. The submersion of the vines, for thirty days at least, with running water in autumn or winter, and the subsequent application of fertilizers—known as the Falcon plan—is the sole efficacious remedy up to the present demonstrated, and so highly is it appreciated that a project is on foot to construct a canal, to be fed from the Rhone, so as to enable several million acres of vineyards to be temporarily inundated. A special commissioner has left for the United States to study a variety of American vine stocks, known in Pennsylvania as the "corn grape," and reported capable of resisting the phylloxera.

VINEYARDS IN CALIFORNIA.

Grape growing in this State can be made a very profitable business, notwithstanding the fact that the so-called "wine-growers" have not made money, and many of them have been obliged to give up everything, after some years of hard work, to foreclosers of mortgages upon the property. Raisin and table grapes have paid well right along; and as the State increases in population and transportation facilities increase, so will the business of shipping fine grapes and making raisins become more and more important and surely remunerative.

We advise the planting of new vineyards of best varieties, and the grafting of the "wine" varieties to table and raisin grapes, instead of tearing up the old vines as some are doing. There is policy in the matter of grafting, as the well established roots will soon make new vines that will bear abundantly of superior fruit. A grape vine produces better fruit after it is a dozen or more years old than when it is younger. The old vines, if cut back and grafted, will, the second or third year after, produce as well as old vines. The maturity and strength imparted to the new top by the well grown roots make grafted vines equal in value to vines of same age as the roots. There is only one difficulty about grafted grapes, and that is the liability of the old stalk that is grafted to send out suckers. If grafted above ground there will be a good deal of trouble to keep those sprouts below the graft from outgrowing the scions. To obviate this, the old vine should be cut off from four to six inches below the surface. Remove the earth from about the vine with a spade and saw the old stalk off as smoothly as possible with a small, fine, hand saw. The root stumps may be split grafted or splice grafted—it makes little difference, so long as the inner bark of the scion and the stump come together to form a union of growth. If the scion is set into the stump so as to touch the vital sap in only two or three places, it is enough to give circulation to the living juices in both stalk and scion. The stronger the cuttings are that are used for scions the better. Slender, weak cuttings are not good for scions. Choose them from the strongest growth of last year's wood. Make the split or cut in the stalk, then wedge the scion to fit and insert it firmly, without bruising the bark on either scion or stalk. One or two buds above ground are enough, and the scions should be shortened so as to admit of not over two buds above ground. Common grafting wax can be used. It is best applied warm with a brush. A vessel holding the wax can be kept over a portable coal stove such as tinkers use. Any one can make one that will answer the purpose out of a joint of stove-pipe. Some persons press the fine earth firmly about the graft and use no wax, and with very good success. The best time to graft grapevines is just as soon as the new leaves get to be about the size of your thumb-nail. Then the vines will not bleed. If grafted before the leaves start the old roots will bleed badly. About the first of April is a good time to graft in many localities. The vines may be grafted earlier, but experience has proved that it is better to graft after the bleeding season is past. The cuttings should be prepared as soon as convenient, and put in a cool shady place out of the wind until time for grafting.

We hope that none of our readers who may have inferior vines will neglect to graft them this season. It will pay to do it. We are willing to admit that the wine business is the poorest paying as well as the most demoralizing business that a poor honest man can venture into. But a good vineyard of useful grapes, for raisins and for the table, is at once respectable and remunerative. The White Muscat of Alexandria is the best raisin grape, though there are other good ones. The White Corinth or Zante Currant grape is bound to prove very valuable also upon this Coast. The business of shipping fine grapes to the Atlantic States will always be a remunerative one. The Flame Tokay, Rose Peru, Black Hamburg and others are good for shipping.

Planting a vineyard in this State is not necessarily a very expensive job. It is not necessary to cultivate the ground any deeper than for a crop of grain. The rows should be laid off six to eight feet apart both ways, and may be struck out, after measuring accurately, with a plow in complete squares, by running straight furrows at right angles. Then in the ditch where the furrows cross plant the cuttings. A long-handled spade, run down the length of the blade, at an angle of forty degrees, will be deep enough to plant the cuttings. Remove the soil enough to insert the cutting and then pack the dirt back closely about it, and it is done. One or two buds above ground are enough. Two men can plant several thousand cutting in a day when everything is ready. The after cultivation should be with harrow and cultivator and hoe, so as to leave the surface soil light and fine and free of all weeds, for the first two years particularly.

This is a very favorable season for planting cuttings, because the soil is so thoroughly filled with moisture, and March and April are good months to them. If you have to plow under a little patch of green grain to make a vineyard, it will not hurt anything but will leave the soil in good condition. Every farmer upon dry land should plant a vineyard for family use, for raisins, and for an investment to pay dividends as a branch of farming.

Sheep and Goats.

A PROGRESSIVE INDUSTRY.

THE Angora goat business, which a few years ago was sneered at by some journals that should have known better, has been brought forward and placed upon a footing that insures for it a grand success and a splendid future.

There was a time when but little mohair was produced here, and there was but little demand for that small quantity. Now the manufacturers are making good bids, in fact there is a wholesome rivalry, which places the product in demand at good figures, and as the supply increases the prices will become better and steadier. The sales of the fleeces for the last two years have proved that, for the mohair alone, it will pay to raise goats. But the mutton is as good, some say better, than that of the sheep, and the pelts are much more valuable for tanning. The common goat skin is little better than the sheep skin, but the Angora skin is fine grained and very strong.

During a late visit to the Angora Robe and Glove Manufacturing Company, in San Jose, we gained several points of information. The workmen can tell by the feel of the tanned skins whether the goats were half, three-fourths or seven-eighths Angora, also by the looks, so striking is the difference. The skin is not so thick and rough—it is fine, soft and tough. We have before mentioned that for strings and belt-lacings they are found to be very excellent, and are being largely used already.

There is about one-half the increase of every flock that are males, and as they are not used for breeding, unless the mohair is very fine, they are killed at from six months to two years old for mutton and pelts. The half and three-fourths breed goat skins are now worth from 40 to 60 cents each for tanning. The finer breed pelts are worth 75 cents to $3 each for making into robes, trimmings, etc. This price will soon advance. The manufacturing company, having only lately started into the business, cannot afford to pay, this year, what they will be able to as soon as the people find out the actual merits of the goods, and there are more pelts to be tanned and make up.

It is estimated that there are now 240,000 grade Angora goats on this coast, but probably 200,000 is nearer the mark. This number will soon increase to one-million, and as they increase in numbers so do they increase in purity, as only pure-breed bucks are used for breeding purposes. Not less than one-fourth of the entire number will have to be slain annually, on an average.

This, it will be seen is to be a great and growing industry. Already the Angora robes and gloves are found to be the prettiest and most useful of any. Some of the finer pelts of kids and full grown wethers, when colored black or some shade of brown, by Mr. Henry T. Welch, resemble the richest furs, and are much admired and prized for rich trimmings to ladies cloaks, etc. As the finer furs are getting scarce all over the world, and continually dearer, these fine Angora kids furs will come more and more into demand at fine prices. And as the buffaloes and foxes and wolves are disappearing, the robes of the beautiful full breed Angoras will not go begging for a market. In fact they are superior to any other robes, and civilization is no loser by substituting the Angora furs for those of the wild and lower animals. Any person who will take the trouble to examine the Angora goods will be satisfied that what we say is even so.

The manufacturing company at San Jose are giving employment to many women and girls in making up their goods. Their machinery for cutting out gloves is quite novel. They have dies made for cutting out gloves, complete in every part, and can cut out dozens at once. But we will not attempt to describe the workings of the manufactory, which is situated on the eastern bank of the Guadalupe, near the San Jose Woolen mills.

The company have lately sent samples of their goods East, and with the most flattering prospects. The only thing we fear is that the demand will soon be so far in advance of the supply that we Californians will not be able to keep enough of the goods at home. From the Green Bay, Wisconsin, *Gazette*, we quote a portion of an article in which mention is made of some goods sent by C. P. Bailey, President of the manufacturing company, and also a breeder of Angoras. Says the *Gazette:*

"Of late years the effort has been made to colonize this valuable quadruped in some parts of this country. It has been tried in South Carolina with some success, but the *strike* seems to have been made in California. Under the auspices of a stock company, some three thousand of these beautiful animals have been induced to graze in the vicinity of San Jose. If it is really the fact that the true Angora goat can be reared on the Pacific coast, we see not why it should not prove a source of wealth beyond mines of gold. Our native furs are growing scarce. The march of civilization is driving back the buffalo, the wolf, the mink, the otter, etc., and but a few years more of "progress" will make furs of any kind a rare and costly luxury. It looks as if Providence was sending these four-footed Angorans from that far land of Turkish barbarism to warm the back of the great Republic during its second century.

"We advise any who have a curiosity about such goods to visit the office of W. C. Bailey, Esq. He has received from his brother, in California, some elegant specimens of this fur, and we understand is very willing to have the public look at them. That very white robe and mat would together constitute a graceful present for your minister or the editor of the *Gazette*, or some other public benefactor."

One mistake we notice in the foregoing. The stock company own no goats, although several of the individual members do. The company is organized for manufacturing, and proposes to confine itself solely to that and the selling of its goods.

We hope the company will make a showing of their goods at the Centennial fair in Philadelphia. They have made no calculation to do so as yet, but the breeders on this coast cannot afford to allow such an opportunity of showing the products of this business to the world to go by without some concerted action. There is not a more important industry on this coast we feel satisfied. The monthly report of the Department of Agriculture for February contains the the following:

"California, in pursuance of a characteristic fashion of doing what cannot be done elsewhere, has not only persisted in keeping considerable flocks of Angora goats, but multiplies their numbers and utilizes the fleece. There have been placed in the museum of this Department some specimens of dressed skin with fleece intact, of divers colors and great beauty, such as are used for fancy robes, rugs, mats, fur gauntlets, and for other purposes. These gloves are very strong, durable, warm and showy. The leather is also used in strings for belt-lacing, and appears from its great strength to be very suitable for such use. This is the work of the Angora Robe and Glove Company, located at San Jose, and demonstrates the availability of Angora products for successful manufacture into articles of comfort and utility. Their gloves, unlike those of buckskin, are dressed with the grain left on. Mr. Frank Leavis, the secretary of the company, is a part owner of a flock of six hundred ewes which were sheared last spring. In one county, Monterey, there are no less than twenty thousand returned by the assessors, and they constitute a portion of the stock of twenty-eight other counties."

Poultry Yard.

Ostrich Farming in Africa.

WITHIN the last dozen years an industry has sprung up in Africa that ought to claim the attention of the people along the Pacific slope of the United States. It is the raising and care of ostriches for their feathers. There are many half-desert like stretches of country here just suited to the habits of the ostrich, and that might probably be put to good use as ostrich pastures, could a ship cargo of those birds be brought here and bred from for that purpose. The article that we select from an exchange almost makes us wish that we owned a fine flock of them, and owned a combined bee and ostrich farm in San Diego county on which to rear them:

Within the last seven or eight years an industry has sprung up at the Cape of Good Hope, which, on account of its novelty and the important results it produces, is worthy of notice. It is that of keeping ostriches in a state of semi-domestication for the sake of their feathers, which have latterly become more and more scarce and consequently more valuable. From the Cape the business of ostrich farming has been introduced in South America, where, as we showed in this journal in 1872, it is carried on with more or less success. But the best feathers are still those produced in the south of Africa.

Like many other important undertakings, ostrich farming, if not actually the the result of an accidental discovery, received a great impetus from an apparently trifling circumstance. A few years ago one of the native traders in ostrich feathers and eggs, having more eggs than he could conveniently carry, left four or five of them in a cupboard adjoining a bakehouse in some Algerian village. On his return about two months afterwards, he was surprised to find the broken shells of his ostrich eggs and a corresponding number of young ostrich chicks. The birds were, of course, dead from want of attention; but the fact was undeniable that the fresh eggs of two months ago, had, under the influence of a high temperature, actually produced fully developed chickens. The circumstances came to the knowledge of an officer in the French army, M. Crepu, who immediately perceived the practical results that might ensue from a careful following up of the hint thus strangely given. He set to work to devise artificial incubators for the purpose of hatching ostrich eggs, while at the same time he procured some pairs of adult birds, with a view to rearing them in a state of semi-domestication.

It is needless here to enter into particulars of the difficulties M. Crepu had to encounter. Suffice it to say that, after many disappointments, he had the satisfaction of finding a live ostrich chick actually hatched in his apparatus, and thus his assidnous efforts were crowned with triumph. About fifty-three or fifty-four days is the full term of incubation, which may be slightly accelerated or retarded by a trifling change in the heat to which the eggs are subjected, although the smallest excess or want of heat beyond a certain limited range is fatal. But to such perfection have artificial incubators now been brought that the whole "sitting" of eggs may be hatched with more certainty than if left to the natural care of the parents.

The baby chick, when it makes its debut, is about the size of a common fowl, and begins to pick up food at once. The nature of the food suitable for both the brood and the adults was a principal difficulty in the first attempts at the artificial breeding of the ostrich; but a careful study of the habits of the birds in a wild state has resulted in the discovery of the best kind of diet suited for the welfare of their domesticated brethren. The principal food given to the young birds is lucerne and thistles and tender herbs and grasses indigenous to the country. Old birds are fed on more matured shrubs and plants, the leaves of which they strip off with their beaks. They are also fed on Indian corn, known at the Cape as "meaties."

It will be interesting to note that when the full number of eggs has been laid, the old birds invariably place one or two of them *outside* the nest—the nest consisting naturally of a hollow scooped out of the sand by the action of the legs and wings of the birds. It has been found that these eggs are reserved as food for the chicks, which, in a natural state, are often reared miles away from a blade of grass or other food. As soon as the chicks emerge from the shell, the parent ostrich breaks one of these eggs and the yolk is eagerly eaten up by the young ones. They are, therefore, both herbivorous and carnivorous; but it is not necessary to gratify their appetite for flesh, as they thrive excellently on the herbs above mentioned. Of course where food is supplied in abundance this precaution on the part of the parent bird of providing meat for their offspring is not necessary, and each egg so left is therefore wasted. Considerable loss also occurs in the number of addled eggs, when they are left to be hatched by the parent birds. It is said that the ostrich is able to discover when an egg becomes addled, and that it immediately ejects it from the nest; thus showing an amount of wisdom which has hardly been attributed to a bird which is popularly supposed to thrust its head into a bush when being hunted, in the vain hope that as it cannot see, it cannot be seen by its pursuer.

These observations were first made in Algeria, but it is at the Cape that they have been turned to practical account, and a very perfect system of ostrich-farming has been established there. Different practices prevail at different establishments. The birds are allowed occasionally to sit; but the success which has attended the use of artificial contrivances is so great that fewer losses occur by this means than under natural circumstances, and the use of incubators is becoming very general. The chicks produced are so healthy as to show that they do not suffer from this mode of treatment.

The arrangement of ostrich farms is similar in all cases. The *desiderata* are plenty of space, suitable soil—that is sand and pasture with facilities for growing the proper food—conveniences for shelter and water. A well conducted farm would require perhaps £3,000 capital to begin in a small way. The industry at the Cape is barely eight years old, and much has to be learned by a beginner. Loss and disappointment are frequently experienced at first; but the occupation is considered a very profitable one, and is certainly healthy and agreeable. Yet nowhere are patience, sagacity and perseverance more necessary than in conducting a good ostrich farm.

A healthy bird of a week old is worth £10; at three months it will be worth £15, and at six months £30 and more. Feathers may be plucked from the ostrich when a year old, and each year's crop will be worth about £7 per bird. At five years the breeder begins to pair his birds, and each pair will yield from eighteen to twenty-four eggs in a season. It is necessary to keep the adult birds in separate paddocks, which are generally surrounded by wire fencing. The ostrich is liable to sudden fits of jealousy. In such a case frequent quarrels would ensue if the birds were all together in one inclosure, with the result, if not of black eyes, at least of damaged feathers, and perhaps broken legs and even death to one of the contestants. The blow from the leg of the ostrich has been computed to be fully equal to the force developed by the kick of a colt seven months old. But whatever be the exact force produced, it is very severe, sufficiently so to break a man's leg.

The ostrich, however, both male and female, is quite an exemplary parent, notwithstanding the popular rumor that, like the crocodile, it leaves its eggs in the sand to be hatched simply by the action of solar heat. Father and mother take it in turn to sit on the eggs, and when the ostrich takes his female companions out for their evening promenade in the desert, one of them always remains by the nest. This fact is sufficient to induce many breeders to leave the eggs to be hatched in the natural way, and merely to devote their energies to the rearing of the young birds and the collection of the feathers.

These are operations that require very great care. Regular supplies of food—about two pounds a day to each adult—are necessary; shelter must be provided for the night and to shield the birds from the violent storms which frequently burst over the southern part of Africa; and there must be supplies of sand and pebbles, which the birds swallow as aids to the digestion. Pepsine is unknown among these birds of the desert, and they introduce a quantity of hard substances into the gizzard to assist them in grinding up their food, just as the dyspeptic featherless biped takes his morning bitters to help the secretion of the gastric juices. It is very amusing to watch the flock of young birds as the attendant enters to scatter their breakfast. The moment he appears with his load of "green meat," the youngsters of the ostrich family trot up to the entrance and caper and dance about in the most grotesque manner, and devour their food with evident relish. They are generally tame and to a certain extent tractable, but as they grow old they sometimes evince a sourness of temper which is anything but encouraging to the formation of a near acquaintance with them.

As the feathers are picked they are sorted according to their quality and purity of color. The pure whites from the wings are called "blends," the next quality "prime whites," "firsts," "seconds," and so on. The tail feathers are not so valuable, and the more irregular the markings of the colored varieties the less valuable they are. "Bloods" will fetch from forty to fifty pounds sterling per pound weight in the wholesale market, and from this price they range as low as five shillings per pound.

The quality of the feathers produced by tame ostriches is fully equal to the best collected from wild birds, while the general average is much higher. Notwithstanding increasing yield, prices are rising instead of falling; indeed, good ostrich feathers are now thrice as dear as they were fifteen years ago. But it is more than probable that as the production increases the price will eventually fall. Even with reduced prices the profits would be sufficiently large to render ostrich farming a very profitable undertaking; and as each year will increase the experience of breeders, the difficulties will be gradually diminished and losses more easily avoided. As it is, this strange industry—the domestication of the wild birds of the desert, once regarded as types of liberty and intractability—is at the same time one of the most interesting and most profitable of the African trader.

A Colony of Ostriches.—Montgomery Queen has purchased 100 African ostriches, and is about colonizing them on his place near Haywards, a small town fifteen miles from San Francisco. It is Mr. Queen's intention to raise ostriches solely for their plumage, each bird yielding over $200 worth of feathers yearly. He has invested $100,000 in the enterprise.—*Denver News.*

Horticulture.

Undeveloped Fruits of America.

A FEW wild fruits may be mentioned which manifestly have great capabilities, that may or may not be developed in the future. The leading instances, in my mind, are the Persimmon and the Papaw; not the true Papaw, of course, which we have in Florida, but the Asia Minor, or Western Papaw so called. Both Persimmons and Papaws are freely offering from spontaneous seedlings, incipient choicer varieties to be selected from both fruit when only a few years old, thereby accelerating the fixation of selected varieties into races; and both give fruits of types wholly distinct from any others we possess of temperate climates. He that has not tasted Kaki has no conception of the capabilities of the Diospyrus genius. The Custard Apples of the West Indies give some idea of what might be made of our Papaw when ameliorated by cultivation and close selection for several generations. I have understood that one of the veteran pomologists of the country, Dr. Kirtland, of Ohio, a good while ago initiated a course of experiments upon the Papaw in this regard; but would be well to know with what success, and if the breeding and selection have been continued through successive generations.

Our American Plums have for many years been in some sort of cultivation and have improved upon the wild forms; but I suppose they have not been systematically attended to. Their exterior liability to black knot and other attacks renders them, for the present, unsuccessful.

Finally, if pomology includes nuts, there is a promising field uncultivated. Our wild chestnuts are sweeter than those of the Old World; it would be well to try whether races might not be developed with the nuts as large as marrons or Spanish chestnuts, and without diminution of flavor. If we were not too easily satisfied with a mere choice between spontaneous hickory nuts, we might have much better and thinner-shelled ones. Varying as they do, excessively in the thickness of the shell and the size and flavor of the kernal, they are inviting your attention, and promising to reward your care. The Peccan is waiting to have the bitter matter between the kernel bred out; the butternuts and black walnuts to have their excess of oil turned into farinaceous and sugary matter, and their shells thinned and smothered by continued good breeding; when they will much surpass the European walnut.—*Prof. Asa Gray.*

About Bananas.—Few people who see bananas hanging in fruit stores think of them as more than a tropical luxury. In fact, they are a staple article of food in some parts of the world; and according to Humboldt, an acre of bananas will produce as much food for man as twenty-five acres of wheat. It is the ease with which bananas are grown that is the great obstacle to civilization in some tropical countries. It is so easy to get a living without work that no effort will be made, and the men become lazy and intolerably shiftless. All that is needed is to stick a cutting into the ground. It will ripen its fruit in twelve to thirteen months without further care, each plant having 75 to 125 bananas, and when that dies down after fruiting, new shoots spring up to take its place. In regions where no frost ever reaches bananas are found in all stages of growth, ripening their fruit every month and every day in the year. Colonel Whitner, near Silver Lake, Florida, has probably the largest banana plantation in the United States, containing fully 10,000 plants in bearing. Some of these are large trees, which do not die after bearing their fruit, but the majority are of the dwarf species, which are renewed every year. Slips are planted about eight feet apart, and rapidly push up leaves, disclosing six or eight small bananas behind this protection. Some plants will have sixteen or twenty leaves and bunches of fruit, bending over as it ripens, forming a most beautiful sight.

The banana is a very tender plant. Says a southern correspondent of the *Prairie Farmer:* "A statement is going the rounds of the papers to the effect that 'the old cotton fields of the South are being planted to bananas.' It is astonishing how much ignorance and misrepresentation have been published in regard to this fruit and the cultivation of it. In my article on the banana, published in the *Prairie Farmer* more than two years ago, I stated (and I repeat it) that to be grown successfully it requires a rich, moist soil and *tropical climate.* These conditions are not found in old cotton fields. The only parts of the United States where it can be grown with success, are the southern parts of California and Florida. It is very susceptible to cold, and even on our gulf coast it seldom matures its fruit without Winter protection, and is not planted as a crop for profit.

Close Planting and Pruning.—We are more and more becoming converted to the practice of close planting and pruning. Take, for instance, black raspberries, or blackberries, grow them close in a row, and like a hedge, by keeping them well cut back as they grow. This makes the branches stiff, so that they do not get down in the dirt, and are easily passed among to pick the fruit, and, too, by mulching the entire surface, the same amount of mulch mulches a much larger number of vines. The roots of all kinds of plants run much farther than most people have any idea of, and simply mulching close around the plant does not answer the purpose. The roots of a plantation of raspberries and blackberries or currants, or even strawberries, run through the entire surface, and hence to be properly benefitted, the surface must be mulched or worked by hoe and cultivator, and the part that most needs this is the extremities of the root. Currants and gooseberries must have a cool, moist place to do well, and if planted on dry soil, this is best secured by a heavy mulching of the entire surface. So, if fruit, and of the best quality, is what is sought for, plant close, prune close, and mulch heavy, is our advice. —*Small Fruit Recorder.*

Orange Culture in Upper California.—From a personal knowledge, derived from a residence in both Los Angeles and Napa counties, we will state that it is our firm belief that Los Angeles as an orange growing county, does not hold a particle of advantage over Napa. We have frost here every Winter, and so do they, and last Winter their orange trees triumphantly passed through, over and above frost, and are now hanging full of golden fruit—a striking illustration of their power of resistance to frost. Comparatively speaking, in a point of fact, the orange trees of Los Angeles demonstrated that they could stand the same amount of frost that grapevines do, without suffering an equal amount of the blighting effect. Now, why not go into the orange business? our market is close and the next best thing is that they frequently pay $1,000 per acre.—*Star.*

[What is true of Napa county is equally true of several other counties, in fact, every agricultural county in the State, in localities below the heavy snow line.—Ed.]

American Tea.—It is said that Georgia is going to try her hand once more at tea growing. Those who have investigated the subject assure us that the obstacles to the culture of tea successfully as an article of commerce in the Southern States are the want of experience and, chiefly, the want of cheap labor. The tea tree of China has been grown by several persons in Georgia, from the Piedmont region to the sea coast. The shrub is a hardy and vigorous evergreen and grows from three to five feet high. It is a neat, compact, laurel-leaved shrub, with pretty, white flowers in Spring and is quite ornamental. It is perfectly hardy and will stand any exposure to the climate, as has been tested in Athens and many other localities in Georgia.

[We believe that Georgia, like California with cotton, tea and silk, will not find tea a profitable plant to cultivate. Whatever requires *cheaper labor* to make it a success in competition with China, we have no present use for, to any great extent, at least.]

The Papaw Tree or Shrub.—The papaw is very common in the Western and Southern States. The fruit is very nutritious and palatable, much resembling the banana. Its introduction here would give us a desirable addition to the number of our fruits. The papaw is pulpy and soft, and probably could not bear long transportation or command an extensive sale in the market, but it would be a very acceptable fruit for home consumption. There are several varieties, some of which grow to the height of ten or fifteen feet, while others are low shrubs. The fruit of all of them is sweet and very fragrant and the product very abundant. The papaw generally grows wild, along the banks of streams, and sometimes forms thickets of several acres.—*Cult.*

In Ceylon large apes are now regularly employed to pull cocoanuts. These animals are imported from Acheen in batches, and marched round the plantations by their owners, who let them out on hire. A line is first attached to these peculiar laborers, and he is then sent up a tree, and is said to select suitable fruit with great discrimination, and to twist the nut round and round till it falls to the ground. Each successive fall of a nut is hailed by the hairy worker with a sort of grim chuckle of satisfaction. » [In California the fruit growers find it cheapor to import Chinamen to gather fruit. Ed.]

Encouraging to Orange-Growers. The cultivation of the orange in Louisiana has of late attracted much attention. One gentleman on Lower Lafourche has an orchard just come into bearing, of 125 acres—said to be the largest in the world. The same gentleman has a tree on his plantation over sixty years old, the fruit of which this year is worth on the ground $100. For several years past the income from this tree has been $50 to $75. The *Co-operative News,* from which we learn these facts, adds that California, Louisiana and Florida are the only parts of the United States in which the orange is now cultivated with success. Its cultivation in South Carolina and Georgia has been abandoned on account of frost. The market for the fruit keeps pace with the increase of production.

Tamarind.—This beautiful tree is a native of the East Indies, but is now considerably cultivated in warm climates elsewhere. Only one species seems to be known—a spreading tree, thirty or forty feet high, with alternate pinnate leaves, which have from twelve to fifteen pairs of small leaflets, and fragrant flowers with three petals, the pods brown and many-seeded, as thick as a man's finger and about six inches long. These pods are filled with a pleasant, acidulous, sweet, reddish-black pulp.

Land Holder.

ANTI LAND MONOPOLY RESOLUTIONS.

Ed. Agriculturist: The following resolutions were adopted at a meeting of the People's Deliberative Association, held at the Estralla school-house, on the 29th of January, 1876:

Whereas, under existing laws, large bodies of agricultural lands have been procured by a few individuals who hold them for speculative purposes; and

Whereas, it is an acknowledged fact that great frauds have been committed to procure titles to land in California under the guise of Mexican grants, swamp and overflowed lands, Sioux scrip, soldiers' bounty warrant, lien warrants, college scrip, and other scrips; and

Waereas, the public journals are the educators of the people; therefore, be it

Resolved, First—That it is apparent that the laws governing land matters have failed to secure the rights of the people; and to say that all that is necessary is a faithful execution of the laws, is but to throw dust in the eyes of the people.

2d—That upon the principle that the Government has the right to grant to individuals or corporations one million acres, it has the right to grant the whole public domain.

3d—That a system of taxation that would force monopolists to sell their lands would be no remedy to these evils. Nothing less than such a change in our laws as would force them to surrender their stolen property to the rightful owners would be adequate to remedying the evil.

4th—That no legislative body has the right to grant any of the public lands to individuals or corporations, excepting to the actual settlers and cultivators.

5th—That, according to American ideas, no man is in the full enjoyment of liberty without a home that he can call his own.

6th That the thousands of our best citizens who are only permitted to till the soil on condition that they pay the rent and please their landlord, are no less slaves than were the negroes in the South to their owners and masters.

7th—That the idea that one man should own large tracts of land to the exclusion of others belongs to the old feudal system, and should not exist in free America.

8th—That it is the duty of the press of this State to show all frauds committed in land matters, by private individuals or public servants, giving the names of all parties therein engaged, that they may be held up to public view, not as enterprising gentlemen, but as public thieves and perjured villains.

W. G. Guppy, Chairman.
John Foltney, Secretary.
Paso Robles, Cal., Feb., 1876.

GOVERNMENT LANDS IN CANADA.

In contrast with the way settlers are generally treated in California, we quote the following from a Canada paper as showing how settlers are encouraged. The Canadians believe that individual prosperity insures the prosperity of the State. They guard the rights of individuals, and no selfish monopolist can defraud the people of their public domain. It is held sacred to actual settlers, as it should be everywhere.

"The conditions of settlement are as follows, according to the latest arrangements: A married man with a family can pre-empt 160 acres, and is allowed to purchase the same amount, to complete the half section, at 50 cents per acre; and all single men or women over 18 years of age can get 160 acres free, but are not allowed to purchase any at any price. The terms of settlement are, to clear on each 160 acres, 15 acres, and build a log house within five years after executing the same."

MAINE STATE LANDS.

There is a large Swedish settlement in Maine upon lands granted in quarter sections to settlers. The State surveyed the lands, laid out the public roads, built school houses, and a log house on each quarter section, also cleared a few acres, as a starter, and required each settler to clear a given number of acres within five years to become free owner. The result of this is, that the State is gainer by a thrifty and increasing population, and taxable property, while the settlers are well-to-do and independent, gaining in wealth, intelligence and comfort each year.

How different this policy from that of California! Here grabbers get all the State lands. Settlers are fenced out of this country, or bled of more money than they can make in ten years, before they can get hold of any. Nature has made a paradise which man has rendered forbidden ground to the deserving.

Federal Land Grants.—The grants of land made to California by the United States are approximated at 7,590,035 acres. Classified—500,000 acres are entered under the head of internal improvements, 1,353,115 as swamp and overflowed lands, 5,229,140 for Thirteenth and Thirty-sixth sections, 46,080 as seminary grant, 6,400 for the erection of public buildings, 150,000 for the benefit of agriculture and the mechanic arts, and 105,000 as salt marsh and tide lands. This makes a territorial area of 2,598,030 acres, or 50 per cent. greater than that of the State of Massachusetts, which State covers but 4,992,000 acres.

Porcine.

The Wild Hog in India.

THE Indian *dookur*, or wild pig, if not so burly as the great mast-fed hogs of Germany, is a fierce and powerful brute, standing over thirty inches at his withers, and wielding tushes which gleam milk-white from his chaps, becoming from six to nine inches long in the well-grown boar. There is nothing in the jungle that he is afraid of, armed with these sharp-edged knives of ivory and clad in almost impenetrable hide. The native shikarris declare that the Deccan boar, when he is thirsty, will "go down to drink at the pool between two tigers, and ask neither for permission," while his temper is quick as his courage is high; for they also say that when the wild elephant comes trampling over the sleeping apartments of his wives and children, the *dookur* will go at the huge intruder and rip at his hocks and flank without a moment's consideration of their disproportion. Over and over again the panther and the pig have been found lying side by side dead in the forest, after an equal contest; for, once committed to any such struggle, the gray boar goes through with it. Not that he has not speed either, in spite of his short legs and heavy carcass. Colonel Shakspeare, a great authority, has just written in his "Wild Sports of India:" "No one but he who has seen it would believe that the wild hog of India can, on his own ground, out-pace at his first burst and run away from the fastest Arab race-horse; but such is the fact. Let the hog be mountain born and bred, —having to travel, in certain seasons of the year, forty or fifty miles every night for his food—then try him on his own hillside, or over the rocky brush of the Deccan, and I will back the hog against the hunter. * * * No man who has not been an eye-witness of the desperate courage of this animal would believe in his utter recklessness of life, or the fierceness that will make him run up the hunter's spear, which has passed through his vitals, until he buries his tusk in the body of the horse, or, it may be, in the leg of the rider." The boars of the plains, however—especially if they get the run of the sugar-canes and garden grounds—quickly lay on fat and become short-winded; but a pahari, or hill pig, who travels for his living, and has to seek it far and wide, does put even a good Arab to his metal over the stones and sun-cracks. He feeds by night, and there is little difficulty in knowing where for the earth will be found turned up in heaps as if a subsoil plow or a gang of railway navvies had been at work. "His snout digs sepulchres where'er he goes," and having eaten his fill of forest roots and berries, his "custom always of an afternoon" is to sleep away the hot light ensconsed in some thicket or close cover of spear-grass and corinda-bush, or perchance in the coolest and dampest part of the jowarree field or cane plantation. Water he must have near at hand, and thus he is constantly found in the woods which border a stream or the slopes of a hill leading down to a lake or pool. In such places the hunt meets, in the early morning or the later hours of the afternoon, with a village full of beaters engaged to rouse up the great swine, whom they hate because he tramples their plantations and roots at their young crops.

"Hog hunting is," says Colonel Campbell, "the most exciting sport in India. As for the pace, there is but one—the very best your horse can muster, he the ground what it may. A lanky, outlying boar can beat a good horse in a spurt of half a mile over the best ground; what, then, must such an animal do over a country covered with loose stones and cut up by ravines? A hog usually selects the worst ground he can find. Going slowly at a boar is very dangerous; for not only may a miss occasion an accident, but, even if you spear him through, he can run up the shaft and rip the horse's entrails out before he has time to turn." And the old boar is considering how to do that as he bounds along, making for the next cover, but aware that two or three of the pursuers are gaining upon him. It is at this juncture racing, steeple-chasing, fox-hunting and fighting—as some one says —are all blended in one; but before it is over the pig will go shares at least in some of the last.

TRICHINOSIS IN THE WEST.—Dr. George Sutton has made a report on trichinosis to the Indiana State Medical Society, in which we find some alarming observations:

From microscopic examination of pork killed in southeastern Indiana, says the report, we have found from three to sixteen per cent. of the hogs affected with trichina, the number of hogs diseased varying greatly in different localities.

That over five millions of hogs are slaughtered and packed in the Western States, not including those which are put up for family use by the farmers; that if four per cent. of the pork is diseased, which we believe to be a low estimate, we have 221,484 diseased hogs put annually upon the market; or, at an average of 200 pounds to the hog, 44,296,800 pounds of diseased meat, every ounce of which, under favorable conditions, is capable of producing disease.

That from the cases of trichinosis that came under our observation, and the *post mortem* examinations, and the effects upon the dog that was fed with the diseased meat, we have come to the conclusion that ninety per cent. of disease produced from eating trichinous pork appears either as gastro-enteritis, or as a diarrhea or dysentery, and not more than ten per cent. as the fully developed form of trichinosis, in which the muscular system becomes affected.

That as diarrhea, dysentery, and enteritis rank high as causes of mortality in the United States, these diseases causing 31,153 deaths in 1870, as shown by the last census reports; and as we have seen that a large amount of trichinous pork, capable of producing these diseases is among the principal articles of food in our country, we thing it more than probable that trichinæ have a much greater influence in the etiology of this class of diseases than has been recognized by the professon.

That it is highly probable that, when the fact becomes more generally known that so large a percentage of pork is swarming with trichinæ, capable of producing disease, it may have an effect upon the use of this meat, and consequently affect the sale, to some extent, of one of the principal articles of commerce in the West."

HOG CHOLERA.—This is a disease which of late years has prevailed to a fearful extent in various portions of the country. Very little is yet known of the cause or the best mode of treatment, although thousands of animals are annually lost by what is said to be hog cholera. But, like many other diseases common among farm stock, there is little doubt that this is the result of improper food or general neglect. In a late number of the *National Live Stock Journal* a correspondent, in speaking of the prevalence of this disease in the Western States, makes the following very pertinent remarks on this point:

The causes of the disease are obscure; but as it is more prevalent in low and undrained localities than on high and well-drained soil, it is considered to be due mainly to miasmatic and mali rious emanations. Confinement in filthy sties, impure drinking water, and a want of change in food, etc., are also among the causes. We are convinced that many animals of this class are annually lost from the effects of improper food, from living in an atmosphere surcharged with poisonous effluvia, the product of animal or vegetable decomposition. Decomposing substances, both animal and vegetable, corn that has undergone a change from long keeping or exposure to damp, and which is loaded, perhaps, with the sporules of poisonous fungi, brine from the meat tub—these and other similar substances are often given to pigs as food, and in many instances have been known to cause very great losses. Much that we have seen convinces us of the necessity of more attention being paid to the quality of the food of these animals than is generally being done and also to the nature of their lodgings, as well as the air they breathe.

This disease doubtless assumes different forms under diffrent circumstances, but the causes are probably the same in all, and might be traced to something radically wrong in the food or general surroundings of the affected animals.

Apiary.

HONEY PRODUCING PLANTS.

IN districts where honey-producing plants are not so abundant as to furnish sufficient feed for bees, and a surplus for honey, bee-keeping can not be made a success unless some such plants as furnish honey are cultivated in such quantities as to supply the want. In the wheat-growing districts bees will nearly starve, unless kept along rivers where there is a good deal of wild pasturage within reach. Mustard is good while it lasts, so are several other plants, as willow blossoms and wild spring clover. But, to be successful, there must be a succession of feed from early till late. Grapes are excellent bee feed. As soon as they are ripe the birds and yellow-jackets break through the skins, and then the bees suck out the sweet juices and make lots of honey. We have known bees to fill several hives from less than half an acre of grapes in a mouth's time. But without the aid of birds, or other insects, the bees could not get through the skins into the concentrated juices and sweets of the fruit. There are several plants indigenous to this coast that are superior honey-producing plants, such as the *mauriuata*, willow, white sage of Southern California, and others.

The following article we quote from the *American Bee Journal*. It will be found instructive and interesting:

"We will first mention those which are a valuable crop, aside from the honey which they produce:

"Buckwheat *(polygonum fagopyrum)* succeeds best on a dry, rich, sandy loam. It is a valuable crop for family use, farm stock, poultry, etc., and will rapidly enrich the soil, if deeply plowed under while in full bloom. Its yield of honey while in bloom, which is of quite short duration, in a favorable season, compares well with any plant with which we are acquainted, but it is of very inferior quality both in taste and color. The seed should be sown in June, broadcast, using three to five pecks per acre.

"Chinese mustard *(Sinapsis Chinensis)* is about as well adapted to the wants of the bee-keeping farmer as any plant can well be. It is well adapted to most soils and does not seem to be affected by atmospheric changes. Prof. J. P. Kirtland says of it in 'Gleanings' (vol. 3, page 18): 'In my belief, the true Chinese mustard holds out the best prospects for this purpose (profitable cultivation) of any plant at present known. * * * It produces more than double the quantity of flowers and seed than either the black or white mustard; the species usually cultivated in this state, the last named, is too frequently sent out from our seed stores as the Chinese. If patches of ground be sown at suitable intervals of time from early Spring till near the close of Summer, our bees will be constantly occupied in collecting honey during those periods when they are usually idle for the want of such supplies as will be thus furnished. The seed of this kind is peculiarly adapted for grinding into the popular condiment, always commands a ready sale and good price, and will insure sufficient income to repay for its cultivation.'

"It is highly prized, when young, as a salad, or as greens; the seed is also eaten by poultry. The honey which it produces is of a very beautiful light yellow color, is of fine flavor, and always commands the highest market price.

"Common mustard *(Sinapsis Nigra)*, is a valuable bee plant, cultivated to some extent for its seed; but it is a bad weed.

"Rape *(Brassica Napus Oleifera*, Fr. *Colza*, Ger. *Raps)* is an important plant both as a bee plant and field crop, and is so well known that no description from us is needed.

"Sunflower *(Helianthus)* has deservedly received much attention during the past few years, for indeed it is as useful a crop as a farmer can raise, the leaves producing an enormous quantity of nutritious forage for stock, and the seeds are eagerly devoured by all kinds of poultry, hogs, etc. They also have a real commercial value, being used in the manufacture of vegetable oil. It yields a large amount of beautiful, yellow honey.

"Lucerne or French clover (alfalfa) *(Medicago sativa)* is one of the best kinds for sandy soil. It is notable for its long tap roots, which penetrate the soil to a great depth, rendering it capable of withstanding a severe drought, and causing a prodigous growth of fine food for stock. As a bee plant it is nearly equal to Alsike clover.

"Italian or scarlet treefoil *(T. incarnatum)*. Introduced from Italy, where it is extensively grown, as also in France, is a profitable crop. Its flowers are produced in long heads of bright scarlet and are sought for by the bees from morning till night. We recommend this variety for trial to our brother bee-keepers. For a crop it should be sown the same as Alsike clover, for soiling during Summer, using from 6 to 10 lbs per acre.

"Yellow treefoil clover *(Medicago Lupulina)* is very prolific and perfectly hardy. It grows very rank and produces honey during our severest droughts. Sow in Spring 7 lbs per acre.

"Esparcette or sanfoin *(Hedysarum Onobrychis)*. This plant is an acquisition alike to the stock-raiser and the bee-keeper, and though usually classed with

the clovers, it is a leguminous plant. Its roots, which are large, hard and woody, remain in full vigor for a great number of years, thus producing annually an enormous quantity of fine honey and forage. It is particularly recommended for feeding milch cows, sheep, etc.

"Vetches or tares (*Vicia sativa*). This species of the pea is grown extensively in Canada and England, where it is highly prized for green fodder, soiling, pasturage, or as hay, being relished by all kinds of domestic stock. Its flowers are beautifully variegated, and are a favorite resort for the busy little bees. Sow broadcast, using about one bushel of seed for an acre of ground, or it may be sown in drills the same as field peas.

"Borage (*Borago Officinalis*, Ger. *Surkenkraut*), though it may not be fully entitled to be cultivated as a field crop alone, yet it certainly deserves a place in every garden. In Europe, it is considered a valuable vegetable, and is to be found in almost every garden. The value of borage is thus spoken of in the *English Mechanic*: 'The large leaves and tender stalks dipped in butter and fried make an excellent and savory dish. The brilliant blue flowers are very pretty as a garnish for salads. * * The young leaves boiled are a good substitute for spinach. * * * Bees are extremely fond of borage and it appears to repay them well for their attention.'

"Mignonette, Parson's new white (*Reseda Odorata Eximia*). Too much cannot well be said of the value of this beautiful plant to those who are raising but a few stocks of bees. Kidder speaks thus of the value of mignonette in his 'Secrets of Bee-Keeping,' page 59: 'If cultivated to the extent that it might or ought to be, it would certainly furnish a rich pasturage for bees; it blooms from June until the autumnal frost. A small patch of this will perfume the air for quite a distance; and were it cultivated by acres, for bee pasturage alone, we should be favored with a fragrant atmosphere that would vie with the spicy breezes of Ceylon, and a honey that would outdo the famed honey of Hymettus for aromatic flavor.'

"It blossoms in the latter part of June and continues in bloom until cold weather (heavy frosts do not injure it), and indeed we are informed by our Southern friends that with them it continues in full bloom during the Winter. There are many other new varieties, but we think they are inferior for field culture, as is also the common dwarf sort (*Reseda Odorata*). The seeds, which are small, should be sown in the Spring, sowing thinly and covering lightly, in drills at least three feet apart.

"Alyssum or rock madwort (*stelnkraut*) is of but little value, except as early bee pasturage. The dandelion furnishes a rich pasturage for bees very early in the Spring. Scatter the seed in your pastures; it will do no harm, as all kinds of domestic stock will eat it, and in a year or two you will have a rich feast for your bees.

"Yellow and white Bokhara clover (*Melilotus leucantha and M. alba officinalis*) are most excellent honey-producing plants, but they are a great nuisance to growing crops, and should not be allowed to spread too much where they are not desired. However, they are well adapted for sowing on barren hills, steep hillsides and broken ground generally, where it is not desirable for cultivating grain.

"Catnip (*Nepeta Cataria*) and motherwort (*Leonurus Cardiaca*). Bee-keepers should not cut down nor destroy these plants, but increase their number, as being the very best honey-producing plants that can be grown. It is a good plan to scatter the seed in stone piles, along fences and other waste places about the farm. It is not a bad weed.

"*Monarda punctata* is valuable for bees but it is difficult to grow it except on sandy or gravelly land.

Patridge pea and Rocky Mountain bee plant we have not tested sufficiently to recommend.

"Basswood or linden (*Tilia Americana*) and tulip, whitewood or poplar (*Liriodendron Tulhpifera*) are worthy alone for cultivation, either for their timber or as an ornamental shade tree. They are rapid and thrifty growers, easily transplanted, and will live for hundreds of years, and are the most valuable monument that a man can build for future generations. Were our public roads, parks, dwellings, etc., planted with these trees, what a boon it would be to all engaged in this interesting pursuit. A good way to introduce them in a neighborhood is to furnish your neighbors the desired quantity on condition that if they grow them successfully they have them free; but if they neglect them and let them die they to pay you cost price. The seeds are to be sown in drills, and cultivated one year, then transplanted, setting from 8 to 14 feet apart each way. The seed will also grow if strewn among timber, along fences, etc.

"The Wild China is also a good honey-yielding tree, nearly or quite equal to the above; but we do not think it will stand our severe Winters."

Bees in Los Angeles County.—Myself and companion have an apiary consisting of 150 colonies of bees, in Los Angeles county, California, 18 miles east of Santa Ana, and 12 miles north of San Juan, in the foot-hills of the coast range of mountains. My partner located here in the Fall of 1873, at which time it was the only apiary in this section. Although his bees were in the old-fashioned box hives, he had excellent success, owing no doubt to the superiority of range and mildness of climate.

Others hearing of his success have concluded to try their luck in the bee business, in the same locality. We have 12 or 14 families located here who are establishing apiaries, having waited for the return of cool weather so they may remove their bees in safety from the valley. We have succeeded in transferring 150 colonies from the old box hives to the Langstroth, without the loss of a single one, although by some accident we lost four or five queens; but they were soon replaced by inserting a frame of larvæ into the queenless hive. In transferring we took 13,000 pounds of first-class strained honey. My partner had taken 7,000 pounds before transferring, making in all 20,000 pounds from 150 colonies in the old box hive. We expect to have at least 200 colonies with which to commence operating in the Spring.—*S. P. H., in Am. Bee Journal.*

In the construction of the San Lorenzo Flume, thirty-four tons of nails were used. The flume is eleven and three-fourths miles in length, and absorbed 1,900,000 feet of lumber in its construction.

According to English papers the foot and mouth disease is still raging almost unabated in that country. It is also spreading among the shepherds' dogs in Yorkshire; the dogs probably catching it from the flocks they tend.

Chicago, the largest grain market in the world, handles 90,000,000 bushels annually, and has now in operation eighteen steam elevators, with a capacity of 15,350,000 bushels.

Capital and Labor.

Song of Progress.

WHAT! shall the future fate of man
Be likened to the past;
And disregard of human rights
Continue to the last?
Shall power, ambition, and deceit
Still warp, and crush, and bind
The mind, and body, dark'ning still
The future of mankind?

Shall Ignorance, in fetters dire,
The masses still enslave;
And Bigotry, in bitter ire,
Its dreary dogmas rave?
Shall wealth and wretchedness for aye
Their glaring contrast find:
And crime and creeds be rife through all
The future of mankind?

Shall Toil produce, but ne'er partake,
Complain, but yet endure?
Is there no physic for the ill,
No remedy to cure?
Yes, there's a problem might be solved
Freedom's ancient to find,
For in the present is involved
The future of mankind.

The task to learn, the part to take,
The duty to discharge,
The obstacle to overthrow,
Advantage to enlarge:
Justice, and Truth, the cynosure
To guide the earnest mind;
The present earnest helper works
The future of mankind.

—[Histrion.

A CRANGER'S IDEA ON THE QUESTION.

BY A. G. S.

WE know the universal antagonism of labor and capital, which explains all labor strikes elsewhere. Wise, or otherwise, they will continue, in the nature of things, until justice and unity shall harmonize the conflicting relations of men and classes, employers and employees. Labor can never be yielded or relinquished, since life itself is only sustained by labor. Labor itself is always the workingman's capital, which should stand forever united and independent, against all monopoly of kings and lords.

The negro chattel had rights, founded in human nature. The rebellion was most terribly bloody, to be sure, but the last resort. Mankind is slow to learn.

The Knights of Agriculture and the Grange are now grand and extensive. We avoid the blood, but claim justice and equal rights for the farmers and producers. Parties and sects are ignored. It is a question of manhood and labor against non-labor and money aristocracy. We inaugurate a new order of aristocracy, namely, the aristocracy of labor.

Man is man, and who is more? Come down to the bushel. Never so big or high, or whatever your rank, station, or title, you all have to eat the same bread with us, and we *produce* it. It is common sense, common labor, common right, common humanity. We want no privileged class of any kind, because the farmer claims equal manhood, and such partiality degrades and crushes him down in the dust. Why so many professional brains, if the common class are endowed with that needed quality? Look at it, and abolish such nonsense. You may boast of your famous lawyers, but the essence of all law even the seedy and swarthy farmer can well understand, and save the fees, through arbitration, though his carefully studied and classical speech be not reported in the morning papers. The substance of all true, practical, common sense religion the plainest and roughest workmen may fully comprehend, without making any man an idol. Such gilt-edged, false distinction ruins the best society, like the old caste system of India. Then your M. D.s spread round thick and stylish; but does not the extra professional dosing largely increase the general poverty? Would it not be wealth to the working class if they would take care of their own health? Even so, evidently.

All superfluous offices, legislation, and burdens of old custom or habit in the past, we would throw off and abolish, because thereby labor is taxed, shackled and crushed. We would strike in various ways: by speech, oral or written, by the newspaper, and by the ballot. Pity a vast majority of editors are so devoid of brain force and moral back-bone. Never fear to speak the bold and saving truth, for speech is our greatest weapon and power. Speak, sing, write, print, the burning and blistering truth. "He that would be free, himself must strike the blow." We may make a bloody strike, but there are wiser methods. Ballots are better than bullets. But the best strike of all is co-operation. Strike for manhood, honor, truth and right; with the plow, the hoe, the spade, the ax, the scythe, the hand, the foot. Strike down tyranny and monopoly. Strike up brotherhood and equality. Strike the saloons, the loafers, the dandies, the politicians, the dead-heads, the aristocrats. Strike for the good time coming—the millennium.

The Grange movement is national, not sectional; and, therefore, when women vote in Minnesota and Texas, they will do the same in California. Millions of Grangers and Sovereigns will be millions for woman's ballot. Then keep it before the people. East, west, north and south—the cause is one everywhere.

Government with us is a multiplicity, a combination, a complication; a mixed, cunning, confused and intricate web, with the people for warp and woof, and self-weaving; a nice, curious, beautiful, harmonious, perfect system! Really, all right for the millennium—only wipe out clean the monstrous and diabolical abuses and abominations, and all those ambitious ones who stand outside, a peg or two above the working class, to boss, assume, grab and monopolize the whole grand job, and lay on the big taxes. We must mark and correct the foul, black proof-sheet, and pick out the knotty and tangled threads, and kill monopoly stone dead.

LABOR.

BY MRS. L. H. GUNN.

Ever since the decree that man should "eat bread in the sweat of his face," labor has been considered a curse, a degrading punishment for the sins of our first parents. From the stately Roman of ancient times, down to the men and women of the present age, we find the idea firmly fixed in a certain class of minds that work is low, disgraceful, tending to make us mere animals, blunting our moral nature rather than elevating us. An essayist says "things affect the mind accordingly as we put them;" thus it is with labor, if we put it as drudgery, it becomes so, and ceases to be a blessing; and so, considering the means without the end, nothing that we have of ourselves in this life, is a blessing, for everything that is worth having is the price of labor, and the better, the more valuable a thing is, the harder the work for its attainment. Iron is heaped in mountain piles, and, comparatively speaking, is obtained with slight labor; while gold-flakes are the fruits of hard, incessant toil. Fishes, in countless numbers, are found almost upon the surface of the water; but pearls come only

by the severe work of the pale diver. The elements of learning are within the reach of all, and obtained by very little effort; but the higher attainments of art and science are the result of labor and industry only. If a person wishes a high moral character, he must work. Good thoughts and noble deeds never come by idleness.

I do not mean by work, necessarily manual labor. A man may work just as hard, and even more severely, with the brain than with the hands alone. If one would write a good book, it is only by years of labor that he can hope to succeed. If he would be an artist, a musician, it is only after a long time of toil that he wins success. Think you that Raphael painted his glorious pictures, or that Shakspeare wrote his wonderful tragedies and comedies without labor. In history do we find one instance where a great advance in improvement and civilization has been made but by toil, sacrifice and bloodshed?

Now, if all things noble and beautiful, if every step in the road to success is the price of labor, can work be called a curse, a punishment? No! a thousand times, No! It is one of the blessings given to man. Go to heathen lands, where man lives almost without labor, see him in his degradation and filth, and then question, if you can, the wisdom of an all-wise Creator in requiring man to work for his maintenance. Work is, in reality, rest—rest from the sorrows, the petty vexations, the temptations to evil which are caused by, or more felt in idleness—for, are not those days in which we lounge about with no particular aim the most unhappy? Finally, let us work.

Work for some good—be it ever so slowly;
Cherish some flower—be it ever so lowly;
Labor—all labor is noble and holy.

Educational.

Unity.

Thought is deeper than all speech,
Feeling deeper than all thought;
Souls to souls can never teach
What unto themselves was taught.
Like the stars that gem the sky,
Far apart, though seeming near,
In our light we scattered lie;
All is thus but starlight here.
Only when the sun of love
Melts the scattered stars of thought,
Only when we live above
What the dim-eyed world hath sought,
Only when our souls are fed
By the food on which gave them birth,
And by inspiration led,
Which they never drew from earth,
We, like parted drops of rain,
Swelling till they melt and run,
Shall be all absorbed again,
Melting, flowing into one.

—[C. P. Crauch.

A Lesson.

Last night I weighed, quite wearied out,
The question that perplexes still;
And that sad spirit we call doubt
Made the good nought beside the ill.

This morning, when, with rested mind,
I try again the self-same theme,
The whole is altered, and I find
The balance turned, the good supreme.

A little sleep, a brief night's rest,
Has changed the look of all that is!
Sure any creed I hold at best
Needs humble holding after this.

—[Chamber's Journal.

"That."

In the following lines the word THAT is used to exemplify its various significations:

Now, that is a word which may often be joined,
For that that may be doubled is clear to the mind;
And that that that is right is as plain to the view
As that that that we use is rightly used too;
And that that that that line has is right,
In accordance with grammar, is plain in our sight.

SUCCESS REWARDS MERIT.

BY ECONOMY.

THERE is no more a royal road to fortune than to knowledge. He who uses not the judgment, and puts not forth the effort necessary to success, deserves not to succeed. *Success* is the reward of merit. There is no such thing as *luck*. Life has no *accidents*. There are misfortunes, it is true, which we neither forsee nor avoid. Events there are whose causes we can neither forsee nor control. But these are the exceptional cases, and their resulting disasters may usually be overcome by other and greater success.

The more we understand of Nature and her laws, the better able are we to provide against misfortune. The more we understand of the principles and laws of trade, the better able are we to foresee financial changes, and prepare against financial disaster.

The farmer who neglects to plow and plant at the proper time, and to cultivate in the proper way, or to take proper care of his harvests when grown, may not be an eminent success in his business; but for this he is not to blame his luck, but himself.

The mechanic who has not learned his trade well, and turns out poor work for his employers, fails, as a matter of course; but it is not his luck or his misfortune, but his fault that good paying jobs pass his shop for his next neighbor's.

The man who is wasteful and extravagant in his living, spending more than his income, is not unlucky, but unwise; and should blame himself, and not his fortune or his stars, when he finds himself owing more than he can pay.

A young man starts in life with the intention of acquiring a competency and living in comfort. He marries a young wife, and both have the same aims and purposes. Both are industrious and frugal. They waste no time. They spend no money unnecessarily. They easily make their income exceed their expenditures. To them the progress to fortune is an easy forward march.

This is not luck. Their success is not an accident, but a result—precisely such as must always follow such causes.

Another young man has also married a young wife. But they have no ideas of economy or habits of industry. In their stead are notions of extravagance—fashionable attire, fine houses, fine furniture, high living, and gay society. They fail, as a matter of course. Their expenses exceed their income; and the occasional visits of officers with writs to their house admits of very easy explanation. If they do not learn wisdom from their failure, and change their habits, they can never take the first step on the ladder of fortune.

This reckless running into debt—this spending of money before it has been earned—this silly vanity that apes the life and habits of those of greater wealth, is wrong in itself, and must keep even the most industrious in life-long poverty. Persons of such habits fail, and ought to fail. It is not right that one should reap the rewards without practicing the virtues of industry and economy. In business, as in nature, this is an inevitable law, and no one can succeed who disregards the necessary conditions.

Failure, like physical pain, is for our good, warning us to make amends by removing the causes that have led to it. Nature is right. We should not complain of her laws, but accommodate ourselves to her inexorable conditions.

"But," says some one, "Old Meanness has succeeded. He is rich. Has success rewarded merit in his case?" This is a great mistake. He has not succeeded. He has amassed money, it is true, but his life is one of the most pitiable of all failures. See him as he walks the streets, preyed upon by the miser's demon. Does he look as if his life had been a success?

Knaves and rogues and swindlers may amass wealth, and often do. But God has linked to every offence its appropriate penalty, and there is no escaping consequences. Stand up Old Meanness by the side of Mr. Honest Man, whom he has wronged out of house and home. Look them in the face. See the honest, happy expression of the one, smiling even in his misfortunes; the other—the demon of avarice at his soul has carried its contortions to his very countenance. Look at these two, and say which has been the successful man. Which of the two is the more worthy of your respect—the honest man, upright in his losses, or the fellow who has stolen himself rich?

But property is necessary to comfort. A man may be happy without it, yet, with it, he and his family will be at least more comfortable. Mr. Honest Man made a mistake. He should not have placed himself in Old Meanness' power. Though his failure has not been so great as that of the rogue who wronged him, he has, nevertheless, failed where he should have succeeded. Though it will be a great comfort to him, as he looks back on the transaction, to feel that he has not sacrificed his integrity, the loss of the hard earnings of the best years of his life must furnish unpleasant recollections. But if he goes to work with energy, economizes his time and earnings, makes his daily gains exceed his daily expenses, he will soon recover from his losses, and possibly have reason to be thankful for the dear lesson experience has taught.

Industry and economy—these are talismanic words. He who has learned them is already on the road to fortune.

THE AGRICULTURAL PRESS.—One hundred years ago it was unknown, to-day it has no superior. And as we enter upon our centennial year, it is with pride we refer to it. We mean when we say the agricultural press, those who write for the benefit of the tiller of the soil, and those papers published in the interest of the farmer. The farmer to-day has access to a literature as pure, as elevating and instructive for his calling, as any other profession. This is the more wonderful, when we remember that fifty years ago, "book farmers," or science applied to agriculture, was sneered at by ninety-nine of every hundred farmers in the land. Now the farmer that has not one or more weekly papers on his table, is going to the wall, "or west." It is a truism, he cannot grow nor sell and compete with the well read, well posted farmer. It is plain to us that in the future there is still greater achievements for this press. The portals of science just begin to reveal the wonderful storehouse of nature to the tiller of the soil. Chemistry just begins to shed its light on the first great occupation of man. Entomology, botany and other kindred sciences have a storehouse of knowledge so full of interest to the tiller of the soil, that though the next centennial may seem a great way off, they will not have scarcely began to unfold their wonders, when our second centennial shall herald its coming with bells and cannon. See what has already been done in perfecting animals, fruits, flowers and vegetables! And yet no one can deny that we have but just entered this field of progress. It needs no prophetic vision to assure the farmer that his mission is coming to the front, and that the agricultural press has but just begun its career. Onward to duty, is the watchword.—*A. S. Moss, Chautauqua Farmer.*

EVERY FARMER SHOULD DO HIS OWN THINKING.—The *Country Gentleman* very truthfully says that it is only within a recent period—at least as compared with the epoch of positive assertion, thirty or forty years ago—that we have found out in farming how completely truth too broadly asserted becomes falsehood, with how many qualifications and limitations theories must be hedged about, and what folly it is to lay down any single dogma for the universal acceptation of all. And, as a natural consequence in our agricultural literature, the tendency is no longer to pronounce upon this or that practice as right or wrong in itself, but to elicit from those who are successful the modes by which and the circumstances under which success was reached, and then to leave each reader to judge for himself to how great an extent a similar course of action would suit his own case, and wherein it might be hazardous to his interests. What we ask, in a word, is the experience of others—what we wish to teach, that each should think for himself.

FARMERS, mechanics, merchants, give your sons a moral and intellectual education as well as an education of facts. Put not a single dollar away for one of them, to be given after you are gone—while there is a school where they could learn, spend it there. Put it where the Sheriff cannot take it from them, or the money changers get it through their ignorance. Put it in the mind, in the brain, and when you are gone, they will rise up and bless you. But above all, don't say "we have got along without education, and our children are no better than we are;" that would be a disgrace to the age in which we live, an insult to intelligence, a slander upon common sense.

THE *Indiana Farmer* of November 6th says: In all our struggles for gain—our desire for fine stock, fine strains, and development of stock—we should not forget that our sons are also developing into better or worse men, in proportion as we care for and train their minds. A taste for good reading and habits of thought should be cultivated in their younger years.

"YES, I know it; I said so; uncomfortability of temper—them's the words that does it. Well, is there not allers uncomfortability of temper in every family, and allers has been and allers will be? Only in the good old times they used to screw it down and keep it under, and they managed to get along without and of your divorces."

THE wheat crop of the United States in 1870, according to the census, was 287,000,000 bushels. In 1872 it was estimated at 246,000,000, in 1873 at 287,000,000 and in 1874 at 300,000,000 bushels, and the average for the last five years is about 280,000,000 bushels.

THERE seems to be a law of animal life that each individual, to be healthy and strong, must have, at least, a certain amount of room. That whenever this law is violated by crowding too many individuals of the same species within a certain space there results disease and degeneration or death.

To Contributors.

Write.

BY OLIVER WENDELL HOLMES.

Yes, write, if you want to, there's nothing like trying;
Who knows what a treasure your casket may hold?
I'll show you that rhyming's as easy as lying
If you'll listen to me while the art I unfold.

Here's a hook full of words; one can choose as he fancies,
As a painter his tint, as a workman his tool;
Just think! all the poems and plays and romances
Were drawn out of this, like the fish from a pool!

You can wander at will through its syllabled mazes,
And take all you want—not a copper they cost—
What is there to hinder your picking our phrases
For an epic as clever as Paradise Lost?

Don't mind if the index of sense is at zero,
Use words that run smoothly, whatever they mean;
Leander and Lilian and Lillibullero
Are much the same thing in the rhyming machine.

There are words so delicious their sweetness will smother
That hoarding-school flavor of which we're afraid—
There is "lush" in a good one, and "swirl" in another—
Put both in one stanza, its fortune is made.

With musical murmurs and rhythmical closes
You can cheat us of smiles when you've nothing to tell;
You hand us a nosegay of milliner's roses
And we cry with delight, "Oh, how sweet they do smell!"

Perhaps you will answer all needful conditions
For winning the laurel to which you aspire
By docking the tails of the two prepositions
I' the style o' the bards you so greatly admire.

As for subjects of verse, they are only too plenty
For ringing the changes on metrical chimes,
A maiden, a swoon beam, a lover of twenty,
Have filled the great basket with baskets of rhymes.

Let me show you a picture—'t is far from irrelevant—
By a famous old hand in the arts of design,
'Tis only a photographed sketch of an elephant—
The name of the draughtsman was Rembrandt of Rhine.

How easy! no troublesome colors to lay on,
It can't have fatigued him—no, not in the least—
A dash here and there with a hap-hazard crayon,
And there stands the wrinkled-skinned, baggy-limbed beast.

Just so with your verse—'t is as easy as sketching—
You can reel off a song without knitting your brow,
As lightly as Rembrandt a drawing or etching;
It is nothing at all, if you only know how.

ADVANTAGES OF WRITING.

We are told that the poet Cowper once contributed an article to a periodical published in his time on the subject of "Keeping a Secret." Although written in a spirit of levity and banter, it had such an effect upon himself that he says "he never told a secret afterwards." We do not know which most to admire, the candor of the poet or the success of his essay at least upon himself. This little incident shows what an effect can be produced upon our minds and characters by boiling down our ideas occasionally and pouring them out on paper to crystalize. They then become definite and tangible.

In the same line of thought, we are told of a witty French philosopher who said that when he wanted a book on any particular subject, and could not find it, he wrote one. And why should he not? He has access to the same materials that anyone else has, and why not put them in order?

Writing upon any given theme is a wonderful collecter and condenser of thought. Our ideas at first come like the invisible particles of moisture that rise from the Southern oceans. Ascending to the sky above they soon form clouds which, borne on the winds, flood the northern regions of the earth with refreshing showers. So our ideas, vague and misty at first, soon overspread the canopy of the brain and flood the whitening field of manuscript with inky floods of thought.

Indeed, the meditative writer will often be astonished at the amount of his knowledge on any given subject when he attempts to write about it. His thoughts will at first come slow and single, like the twilight stars of evening, but in a little while his whole mind becomes illuminated with the twinkling gems of thought.

Walter Scott, as a school boy, was the butt of the school, and his teacher pronounced him a dunce. But Sir Walter Scott, the novelist, historian and poet—the Wizzard of the North—has entertained the world with his witching stories, instructed it with his histories and electrified it with the pathos and sublimity of his poetry.

Bulwer somewhere frankly acknowledges that it was all up-hill business with him when he first began to put pen to paper. He was not only unable to collect his ideas, but, unfortunately, he had no ideas to collect! Can you imagine, kind reader, a more hopeless case than this? And yet, behold his star, proudly ascendant, shining brightly among his peers in the galaxy of English literature.

We shall not touch upon innate ideas, or acquired ones, either. We shall not inquire whether the infant mind is a *tabula rasa*—a virgin sheet of white paper as yet not written upon, nor argue that thought is or is not a secretion of the brain, as milk is of the breast, and both of them elaborated from the food by that wonderful alchemist, the human stomach. We care not whether according to this materialistic theory, an ear of Indian corn might be sent to Congress and electrify the nation with its eloquence. Nor shall we undertake to discuss such questions as the spiritualistic theory, that it is to ministering angels that ever hover around us, we owe all our best and brightest thoughts. We will not, therefore, be like the man who,

> "On hypothetic dreams and visions
> Grounds everlasting disquisitions,
> And raises endless controversies
> On vulgar theorems and hear-says;
> Grows positive and confident
> In things so far beyond th' extent
> Of human sense, he does not know
> Whether they be at all or no!"

But one thing we do know. The cultivation of the faculties of the mind—perception, observation, comparison, reason, memory, or whatever they may be called—strengthens them; and the attempts to express in written language the results of that culture make each effort easier than the last, until the persevering writer acquires a facility of expression as astonishing to himself as it is pleasing and instructive to his readers.

But the point which we have attempted to make in this article is to induce the many and intelligent readers of the Agriculturist to take up "the gray goose quill" and become better acquainted with its use and power. "The pen is mightier than the sword." There are thousands of our readers, young and old, of both sexes, who would find it greatly to their benefit to jot down their thoughts daily, about the house, the farm, and the million of topics connected with active life, its mission and its duties. While we cannot all expect to gain great renown as writers, we should feel it our duty to add our might to the general fund of useful information. We who can appreciate the benefits we receive from the thoughts and experience of others should be willing to give our own for others' benefit. There is no farmer, mechanic, or other industrial person, no house-keeper or general observer, but has some ideas and knowledge gleaned from life that might be of use to others. A farmer who reads agricultural papers, sees something occasionally that he might criticise to advantage, and could find time to talk about many practical things. Then why not write down your thoughts, and give us your experience? We never yet talked with a housewife who could not give some recipe, or who had not some excellent rules for labor-saving management. We want just such practical ones to write. Your communications, if not used, will be respected. We want the young men, and young women to write. A little play of the imagination is often refreshing. If we cannot use every contribution we will be frank with you, at any rate. Remember ths prisoner's spider who did not reach the opposite wall until after the fiftieth attempt.

Hygienic.

PRACTICAL HEALTH TOPICS—NO. 2.

BY "JEWELL."

FOOD.

In speaking on this subject I am aware of undertaking a great and exhaustive work, open to conjecture, theory and research by learned men, as well as the various hobbies of the ignorant and thoughtless ones. Still, a few plain remarks on the subject, anything, in fact, to set the people to thinking on so important a matter as the food we eat, of which the blood is made, which in turn supplies bone and muscle, tissue and brain power, may not be amiss from any source. It may be well for us to see ourselves, in this Centennial year of the nation's growth and pride, as others see us and as we are—"a nation of dyspeptics." Yes, scarce a healthy man or woman can be found in all our land, of American parentage. Indeed, our historians say, that were it not for the foreign element that is mixing with the Yankee blood, our nation would die out! Oh, glorious America! Oh, boasted civilization and vain ambition! How much more might we be and do if we were strong-bodied, like the German and Irish! And what gives them the strength and vigor we lack? Not intelligence nor climate surely; for in spite of our feeble bodies, the brains are *equal*, if not superior—taking the masses—to either or any nation. Then what might we not expect from bodies sound and robust. And our climate cannot be excelled in any land, taken collectively. Our habits of life vary little with other nations—save in our *food*—if we except the high-pressure speed at which we live. It is well known that the Irish, as a nation, live largely on potatoes, vegetables, coarse bread and milk; the Scotch ditto, with the addition of oatmeal, which is indispensable at each repast in some form; while the Germans use coarse, hard, stale bread, vegetables, but little fresh meat, and are much given to coffee and beer and a social good time which greatly aids digestion. The woman work hard, but out-of-doors and less over a hot stove than our people. In none of these countries do you find the everlasting hot bread or biscuit, pastry, fresh pork and salted too, fried meat and potatoes, confections of all kinds, as we do in our land. A German baker told me that he never made a pie or fancy cake in his country; had to learn that here. It was the same with bread-making; he could not sell the old country style of bread here. Consequently they lose their health after coming and remaining long enough to contract our habits of eating. Many physiologists claim that we partake of the nature of the food we eat; as, for instance, the carnivorous animals are more savage when fed on meat than when they eat only grains or vegetables; and those Indian tribes who live by hunting, eating meat as the staple article of diet, as the Apache, Navaho, etc., are savage and unfriendly to the whites, cunning and wild, never to be trusted, while those nations who lead a pastoral life, cultivating fruit and grain, and raising cattle for use rather than for food, like the Pemos of Arizona, the Zuni, Moquis and Pueblos, of New Mexico, are friendly to the white s and at war only with the savage tribes.

If, then, food can effect animals and tribes of Indians, as we see it does, why not bring it home to ourselves, and see if our diet is such as to make us the highest and best that is possible. While the land is flooded with health tracts and magazines devoted to this question, like the *Science of Health, Herald of Health, Laws of Life, Health Reformer*, and plenty more like them, surely none of us should ignorantly close our eyes and ears to so important a subject.

Careless Handling of Children.—I wish to enter a protest in the name of all nervous persons and of the injured little ones against the reckless way in which many heedless persons express their love for children, such as lifting them up by their heads, tossing them up in the air, carrying infants on their hands without any support to their backs, and otherwise endangering their limbs and senses. I have now in my mind the case of a man who was rendered a cripple for life through his father's carelessness in lifting him by the ankles while he was a small child, he (the father) having unfortunately lost his balance and turned his child's ankles in such a way that he was lame ever afterwards. Two different persons have told me that they knew, when too late, that by their thoughtless play with them they seriously injured infants entrusted to their care, one case resulting in spinal disease and the other in fits. And yet it is a sight daily to be seen—that of people doing these things. Do give the little folks tender handling.—*Rural New Yorker.*

Open Your Windows.—There is good sense in this. There are some houses in every town whose windows might as well be sealed in with the walls for any purpose they have but to let in the light. They are never opened, Summer or Winter. In Winter it is cold; in Summer the flies stray in, or if they are netted the dust sifts through the nets. Now you can tell a person who inhabits such chambers when you pass him in the street, there is such a smell about his clothing. You long for a sniff of cologne, or hartshorn, or burnt feathers, or something of the sort to "take the taste out." A house that is never aired has every nook and corner filled with stale odors of cooked meats, boiled vegetables, especially cabbages and onions, which, as the weeks go by, literally reek in their hiding places. Who has not wished sometimes to hang a new set-

vant's clothing out of doors some frosty night until it should be thoroughly aired? Fine ladies come sweeping into church with their velvets and silks, said velveta and silks giving unmistakable evidence of having been housed in just such shut up chambers. Oh, what a tale that odor of pork and cabbage tells about that lady's style of housekeeping! The very garments of the children tell the same story of uncleanliness. It is bad to have unwashed clothes, but there may be an excuse for it; but what excuse is there for unaired ones when the air is so cheap and free? There is death in such close rooms. Better a swarm of flies or a cloud of dust—better frost and snow in a room than these intolerable smells. Dear girls, the first thing in the morning when you are ready to go down stairs, throw open your windows, take apart the clothing of your beds and let the air blow through as hard as it will. There is health and wealth in such a policy. It helps to keep away the doctors with their long bills. It helps to make your eyes sparkle and your cheeks glow, and to make others love your presence. Girls who live in those close, shut-up rooms can hardly be tolerated in any circle.—*Hall's Journal of Health.*

Health Maxims.—The best three medicines in the world are warmth, abstinence and repose.

Whatever promotes a comfortable and harmless state of mind promotes health.

Men consume too much food and too little pure air. They take too much medicine and too little exercise.

Patent medicines are temporary in their effects; they alleviate or smother, instead of eradicating disease.

Very many diseases are laid at the door of "the weather." It is the want of weather which brings multitudes in our larger cities to the timely grave.

In small quantities and occasionally many things may be eaten with advantage, which, if eaten continuously for weeks and months, or in inordinate amounts, would occasion serious results.

Persons may outgrow disease and become healthy by proper attention to the laws of their physical constitutions By moderate and daily exercise men may become active and strong in limb and muscle.

Pads and supporters are all pernicious and worse than useless, because they teach the system to rely on them, and cannot support one part of the body without causing an unnatural strain on some other part, and to that extent tend to disease that part.

To all young persons, to students, to the sedentary, and to invalids the fullest sleep that the system will take, without artificial means, is the balm of life; for without it there can be no restoration of health and activity. Never wake up the sick or infirm or young children of a morning. It is a barbarity. Let them wake of themselves.

Speaking of changing the clothing, we consider it hazardous to lessen its amount after dressing in the morning, unless active exercise is taken immediately. No under garments should be changed for lighter ones during the day ordinarily. The best, safest and most convenient time for lessening the clothing is in the morning when we first dress for the day.—*Dr. Hall.*

Spring Hygiene.—The New York *Tribune* gives a few timely hints in regard to the mistake people often make in early Spring; when the weather looks fine, bang bright but cold, in going out with insufficient protection in clothing, and in letting the fires in the house go out too soon. The old-fashioned belief of our grandmothers that there was a fatal influence in the Spring air, was not so great a mistake, but was founded on experience, and they fought against it with flannel wrappings and woolen stockings worn until June; and we would do well to take a hint in this direction. The records of our physicians show that the standard of general health is lowest in the Spring. This is partially due to the nervous exhaustion of the labor in closed rooms in the Winter, and partially to the less wholesome diet, which, however good it may be, is never equal to that of Summer, with its fresh vegetables and fruits. It is, therefore, necessary to be prudent in Spring, and instead of exposing ourselves to the danger of taking cold, to be very careful how we clothe our bodies, heat our houses and fill our stomachs.

AN EPISODE IN MY EXPRESS LIFE.

BY "JOE."

It had been one of those terribly sultry days that are sometimes experienced in the Sacramento valley, and, in fact, in all of the interior valleys of California, and which no description can convey to the mind of those who have never "been there themselves." I was the sub-clerk (scrub-clerk was what my teasing companions were wont to call it) in the express office in a town where the stages from the mines and Sacramento centered, and from the very large amounts of treasure that passed through our hands our office was considered quite an important one.

As I said, it had been very sultry, and even the light work of the office had nearly exhausted us. The stages, with their freights of gold-dust, and dust-laden and begrimed returning miners, had come and gone, and those bound for the mines with their coin, and "spick and span miners" that were to be, had gone their way also, and we closed up our day's work, thankful for the approach of the cool and refreshing night.

The porter and I slept in the office, while the agent, or head man, had a room adjoining, the door of which opened into the main office.

Night dropped down upon us with its cooling breath, and we sat in the gloaming, chaffing one another and chatting over such things as lone men will who have been a long time away from home. At length the porter and I built up our beds outside the counter, in the airy office, and stowing ourselves away under the comfortable blankets, which, notwithstanding the heat of the day, were a necessity at night, we were soon lost in the mazes of dreamland.

How long I slept I know not, but I was suddenly roused by a heavy hand laid on my mouth and the not very dainty touch of a metal bar to my temple (which, to my gradually awakening senses, resolved itself into the muzzle of a pistol), and a hoarse whisper of "Lie still, or you're a dead man."

I was limp as a rag in an instant, for I knew well what was up. The notorious Jack Powers had been collecting illegitimate tribute in the country about, and our office attracting his attention, here he was. To bind and gag me was short work, and I was tossed over the counter like a pinioned sheep, coming with a bump onto the floor and the porter, who I found had preceded me with a similar experience.

My ears were free, and my whole attention was concentrated in the sense of hearing. I could, after a little, trace the robbers by their foot-falls almost as well as I might have done by sight, by the dim light we always left burning in the office.

The agent was brought out from his room, bound and seated in a chair. He was then ordered to deliver up the keys of the vault, in a tone which meant "no delay." He demurred, however, and was coolly advised that his personal safety depended on compliance. The keys were given up, and the robbers set to work at the vault. A combination lock balked them and the agent was called upon to give the combination. A short parley took place on this, for the agent was no coward, and he thought he might gain time enough to frustrate the designs of the robbers. But he reckoned without the host. The ominous "click" of a pistol was heard, and "two minutes for that combination!" was the word. Considering discretion a virtue just then, he practiced it, and gave, in a short pause, broken only by the sound of the key, muttered curses, and then an impatient "D—n this mask; I can't breathe," from the operator, next hurried steps and a fierce, but subdued, voice speaking to the agent—

"Curse you; you've lied to us. It's *not* the combination, and we'll fix you!"

"It *is* the combination," I heard the agent say. "You can't have worked it right or you would open the door."

Again the combination was given, carefully and clearly. Again a pause, with the "click, click" of the knobs and key, and then, to my relief, the creak of the swinging door. The tramp of the robbers in and out of the vault, the "sug" of the plump bags of gold-dust as they were dumped into a sack was all that I could hear. Then came the "clean up."

"Well, Cap," says a gruff voice, "we are all right; what'll we do with these fellers?"

"Light out and leave 'em," a musical, manly voice replied.

"Not much," returned the gruff one. "This 'ere feller has seen too much o' *me*. That cussed door made me hot, and I couldn't stand that mask, and this feller knows *me* better'n his own brother. *He's* got to go, *sure!*"

"Guess not," said the quiet, manly voice. "It was your own fault. We've got all we come for, and we'll take no more than we want."

"But I tell you *my* life is wuth more to *me*, and to you, too, than *his'n*," the gruff voice answered; "and, by G—, I'll take no chances in that line."

"Bill," said the cool voice, seeming to grow cooler as the other heated; "this yer is between you and me. Who is captain of this party—you or me? *I* say we go as we are; and if there's to be any shooting there's *two* to do it."

Much more was said by both, and my blood curdled in my veins to hear a man's life made the subject of such contention, the man most interested sitting, meanwhile, bound hand and foot, and unable to help himself. Finally, the gruff voice softened down a little, as if convinced, and said, "All right, Cap. I was wrong and you was right. You go ahead with the rest of the boys and I'll stop behind and keep these fellers from squeaking right away, and after you're well away I'll jine you."

"Not much, Bill," said the manly voice; "that's *my* biz. I don't leave any of you fellers to look after *my* safety. I'll stop here *myself*, and you go along with the boys. I'll meet you at the old place all right."

A little discussion took place on this point, in which the cool voice came out ahead and the gruff one, with a muttered curse or two, was silent.

Silence—what silence that was, too!—for what seemed an hour, but which was but fifteen or twenty minutes, and the quiet, manly voice says, "Mister, you'll allow I saved your life to-night, now you must give me a show of one hour for mine—after that I take my chances."

A striding step, a bang of the door, a galloping horse, and—*silence.*

I had been squirming around, easy like, trying my bonds, and had got myself pretty loose, so that it took but a few minutes' tugging to get free, and I was by the side of the agent. He was in a cold sweat, with his teeth clenched and an ashen paleness over his face, visible even in the dim light of the office. I loosened him and the porter, and in a short time the town was alarmed.

The amount taken was not as large as it might have been at almost any other time, as the receipts from the mines had been light that day. But it was enough to cause the express company to offer a handsome reward for the arrest and conviction of the robber whom the agent was so well able to describe. But nothing came of it for years.

The agent received a terrible shock, which affected his health to such a degree that he could never even allude to this night's experience without the perspiration starting on his brow. He was given a pleasanter and more lucrative situation in the San Francisco office, and was looked up to by the fledgling expressmen as "grit to the backbone."

One day he received a telegram from a branch office in a southern mining town to "come up immediately." He obeyed, and on arrival was unsuspectingly ushered face to face with the man who had so fiercely argued with his leader for a man's life. The robber had been shot through the lungs while being pursued for horse-stealing, and the reward yet out had sharpened the wits of his captors, and they wanted the agent to identify him.

The identification was complete, and horrified the spectators, for the instant the agent saw the robber he sprang for him with blazing eyes and clenched teeth. The bystanders immediately grappled him, and then the ensuing scene was said to be terrific. The robber, with his life ebbing away, lay supinely on a pallet, blood slowly oozing from his mouth, while the agent raged, a madman, in the hands of the bystanders. He foamed at the mouth, cursed the dying wretch as never man was cursed before, and was finally dragged away to fall, weak and exhausted, into a chair in an adjoining room.

The robber died of his wounds, without disclosing anything concerning the robbery, but the recollection of it, to us who were there, is a terrible reality, as vivid as ever.

Stock raising in San Diego County has experienced a very decided increase during the past year, the aggregate value now being $577,903, against $373,306 in 1874 and $320,680 in 1873. The amount of bees has also increased from 2,458 hives a year ago, to 8,761 hives in 1875.

In making whiffletrees, they will be srtonger if the front side of the whiffletrees is nearest the heart timber and the back side toward the bark; they will retain their shape longer if the timber be split in this direction, not across the grain of the wood.

Do not forget to renew your subscriptions at once. In doing so, obtain the names of your neighbors also.

Boys and Girls.

The Country Boy.

"PITY the poor little country boy,
Away on his lonely farm!
The holidays bring him no elegant toy;
He has no money; there is no shop;
Even Christmas morning his work
doesn't stop;
He has cows to milk,—he has wood to
chop,
And carry in on his arm."

Did you hear that, Fred, as you came through the gate,
With your milk-pail full to the brim?
No envy hid under your curly brown pate—
You were watching a star in the morning sky,
And a star seemed shining out of your eye;
Your thoughts were glad, you couldn't tell why:
But they were not of toys, or of him.

Yet the city boy said what he kindly meant,
Walking on by his mother's stately side,
With his eyes on the toy-shop windows bent,
Wishing for all that his eyes could see;
Longing and looking and teasing went he,
Nor dreamed that a single pleasure could be
Afar in your woodlands wild.

You ate your breakfast that morning, Fred,
As a country boy should eat;
Then you jumped with your father upon the sled,
And were off to the hill for a load of wood;
Quiet and patient the oxen stood,
And the snowy world looked cheerful and good.
While you stamped to warm your feet.

Then your father told you to take a run,
And you started up the hill;
You were alone, but it was such fun!
The larch and the pine tree seemed racing past
Instead of yourself, you were so fast;
But, rosy and out of breath, at last
You stood in the sunshine still.

And all of a sudden there came the thought—
While a brown leaf toward you whirled,
And a chickadee sang, as if they brought
Something the wonder or surprise for you,
As if the trees to delight you grew,
As if the sky for your sake was blue—
"It is such a beautiful world!"

The graceful way that the spruce trees had
Of holding their soft, white load,
You saw and admired; and your heart was glad,
As you laid on the trunk of a beech your hand,
And beheld the wonderful mountains stand
In a chain of crystal, clear and grand,
At the end of the widening road.

Oh, Fred! without knowing, you held a gift
That a mine of gold could not buy:
Something the soul of a man to lift
From the tiresome earth, and to make him see
How beautiful common things can be—
A glimpse of heaven in a wayside tree—
The gift of an artist's eye!

What need had you of money, my boy,
Or the pretty money toys bring,
When every breath was a breath of joy?
You owned the whole world, with its hills and
trees,
The sun, and the clouds, and the bracing breeze,
And your hands to work with: having these,
You were richer than any king.

When the dusk drew on, by the warm hearth
fire,
You needed nobody's pity;
But you said, as the soft flames mounted higher,
And the eye and cheek of your mother grew
bright,
While she smiled and talked in the lovely light
(A picture, of pictures, to your sight),
"I am sorry for boys in the city!"

—[St. Nicholas.

"OUR CORNER."

Well, little folks, here we are, with so many letters I'm afraid the Editor will hardly give us room for them all, but Aunt Polly won't have to talk so much if you young folks keep the corner filled. Don't make your letters too long, and there'll be plenty of room for all. We'll let Jenny speak first, as she brings a rebus with her letter:

LIVERMORE, January, 1876.

Dear Aunt Polly:—I was reading the AGRICULTURIST and saw your Greeting to the Young Folks and the puzzle you gave out, and thought, as you asked the "cousins" to send in the answer if they could find it out, I would send it, as I had made it out. I think it a very hard one indeed. I did not understand it at first, and my brother showed me how to make out the first one or two and I found the rest out myself. The three-fourths of a cross is T; the circle complete is O; the upright where two semi-circles meet is B; the acute-angled triangle standing on feet is A; the two semi-circles are C-C, and the circle complete is O—all together forming "Tobacco."

I remain your friend, JENNIE D.

Well done, Jenny! Your rebus will be found below. I hope others will follow your example and send in original rebuses, charades, enigmas, riddles, conundrums—anything for us to puzzle our brains over.

SOQUEL, January, 1876.

Dear Aunt Polly:—My papa takes the AGRICULTURIST, and I have read the letters of the little boys and girls, so I thought I would try and write one. I have a nice little colt named "Stocking-feet." It is not old enough to ride yet. We—my brother Frank and I—have got a nice big black dog named "Nig," that we are training to work in harness. When we get him trained so he will work good, Papa has promised to make us a nice wagon. We have lost the paper that had your address in and don't know how to direct this letter. Mamma says direct it to the AGRICULTURIST Office, San Jose. From your nephew,

G. M. OED.

Aunt Polly is very glad you tried, and wishes every one would do as much. Next time direct to Aunt Polly, AGRICULTURIST Office, San Jose.

Dear Aunt Polly:—Mamma says that you want all the little children to write to you every month. I don't know what to tell you about because I don't know what you would like to know, but I hope some more boys and girls will write to you and tell what they got for Christmas. I think Tom's sister Mary was real good to write for him, don't you? I laughed at Tom losing his apples, but I think it was real mean to play such a trick, don't you? I believe I know that boy, Tim, that shot that rat, but his name ain't Tim. To-day it is snowing a little, right here in San Jose. GEORGIE.

What Aunt Polly wants to hear about is just what most interests you, and whatever you think would be interesting to the other little readers of Our Corner.

Aunt Polly:—I am twelve years old, but not too big to want to write to you, because I've guessed the puzzle you put in the paper, and hope you will give us a new one every month. I like puzzles. The answer to this one is "Tobacco," and I don't mean to ever use it. My father don't, nor Uncle Ed, and it don't seem as if a gentleman would, either.

EDDIE T.

Certainly you're not too big, Eddie. Aunt Polly allows a great deal older boys than you to write to her, provided they don't use tobacco.

SPRING LAKE, Cal.

Dear Aunt Polly:—I am afraid to try to write you a letter, because so many little boys and girls will write so much better letters than I can. I think of lots I want to say, but somehow I don't know how to tell it in a letter. Mamma says we should always try. I think it is a real nice plan to have a corner all to ourselves in the paper, and hope lots of little boys and girls will write letters for it, because it is such fun to read them. I did not guess your puzzle, but was told the answer to it, and I'm sure I hope that no one I like, or ever care to like, will ever use such nasty stuff. If all the girls in the world were like me they would just say to the boys, "If you use tobacco at all when you are men we will never, never speak to you, or go anywhere with you, or do anything you want us to—no never!" Would not that be just right, Aunt Polly? And they mustn't *drink whisky* either. Oh, Aunt Polly, I guess my letter is too long already, so I will close it. From your little friend WILLA ROSE.

It would no doubt be a good thing if every little girl, and big girl too, were as determined as Willa on the tobacco and whisky subject; but she must remember that there are habits almost as bad that little girls are apt to fall into. There isn't room in the corner this month for Willa's little brother, so he'll have to wait.

Aunt Polly thanks you all for your letters, and hopes to hear from a great many more cousins before next month. She is sorry she has no hard puzzles for you to crack this time, but she would like to see who can form the greatest number of separate words from the word "carpets." Of course you can use each letter as many times as you please.

Here is an enigma some one has sent us:

I was not in the beginning, yet was present at the creation, and with the morning stars when they sang together; with Moses when he talked with God and with the old prophets, but not with the disciples. I dwell neither on land nor water, yet am found in the ocean and on the continent. I am with the old in their sorrow, and share the joys of youth. I am a stranger to the rich, but the miser cherishes me in his gold. Am with the widow and orphan, yet dwell with the opulent and am embraced by all with love. I am with the school-boy when he learns his lesson or spins his top, and the schoolgirl speaks fondly of me when she exclaims, "O, do help me write a composition!"

Here is Jennie's rebus:

My first is in *heat* but not in cold;
My second is in *silver* but not in gold;
My third is in *fear* but not in doubt;
My whole is what no man can live without.

N. B.—The answers should always accompany puzzles that are sent.

Household Reading.

FRIENDLY LETTERS—No 1.

BY MRS. M. E. T.

DEAR EDITOR: Please permit me to express my admiration for the new volume of the AGRICULTURIST. It is delightful, and too much cannot be said in its praise. I would like, also, to thank those who have, by their labors, aided you in placing before us a magazine so admirably adapted to our real wants. Every page is fraught with interest. The selections are well chosen, the poetry excellent, and letters and other correspondence instructive in the highest degree; the whole presenting a delightful reality that cannot fail to be appreciated by readers everywhere. What a pleasant treat are the letters from the little folks to Aunt Polly? and who does not love to read them?

Please allow me to say to the

LITTLE BOYS AND GIRLS

who read the AGRICULTURIST, I hope you are all trying to be good children. Little boys, let me say to you, be very careful about the habits you form. Do not use bad words, do not swear, and above all never learn to smoke or chew tobacco, and some day you will feel thankful that these fetters do not bind you in slavery. I have a boy, taller now than his mother, and of whom I am proud. I will tell you of the little contract we made, when he was scarcely higher than my knee. Willie promised that he would never use bad words, never use tobacco, nor visit saloons before his twenty-first birthday. For these promises I gave him the pretty speckled hen and her brood of chicks, the beautiful hay colt that trotted so nicely, and then, if he kept his pledge faithfully till the specified time, he was to have other presents according as we may make further agreement. This contract is still standing firm. It has never once, to my knowledge, been violated, and I feel sure now that it will not be. Perhaps some of the little boys who read this would like to make such a contract. I think it a very nice plan, for bad habits are generally formed in youth.

Sometime, if our kind Editor will grant me space, and you wish me to, I will tell you some funny little stories that a mother's memory has treasured—the wise saying of a sister and brother that will make you laugh all over. I think your little letters to Aunt Polly are very nice, and I hope to see many of them in the AGRICULTURIST.

THE UP-COUNTRY LETTERS.

And now, if my letter is not already too long, I will say to my invalid friend—Yes; there is one reader at least that can "comprehend it all," that has "felt and endured" the very same, that can tell the same sad story. For twenty years I have been a member of this "Order of Wretchedness," submitting as patiently as possible to its cruel laws. Ah! if we only knew before entering what a gloomy place we should find, how careful we would be to guard our footsteps! But, alas! we venture on till we cross the threshold, until the door is shut; we find no way of escape, and no rest for the aching body. Separated from the happy outside world, everything seems changed. We cannot understand the unequal laws that govern our destiny. Not all the guilty are doomed to enter—some escape with impunity; others declare that injustice is done them—that the rod of affliction falls not in consequence of violated laws, nor through inherited sins.

Are we, then, unfairly dealt with? Does Mother Nature surround us with mystery in order to hide her partiality? Or does she grieve over our ignorance, and lament over our short-sighted vision? To these perplexing questions comes only the echo of a silent answer, too faint to satisfy the anxious soul. How much wiser to cease from worrying. Why oppress ourselves about that which we can neither make nor mend? Why be troubled about that which is beyond our sphere, and which only tends to lengthen the shadows that darken our pathway? Rather let us trust in Providence, believing that an all-wise Creator governs the universe.

And now, kind Editor, I once more crave your indulgence before concluding my variety letter. "A Devoted Subscriber" asks

HOW TO WASH FLANNELS

without "shrinking, changing color, and feeling sticky." Of course, some colors are so poor that a simple wetting will fade them; but aside from such exceptions, the first requisite is *good soap*. Never use any of the cheap chemical soap for flannels, but make a suds from good soap, in quite hot water. Rub the pieces to be washed quickly and carefully and wring them; then, in water equally hot, rub them through a very light suds. Two waters as usually sufficient to cleanse them. Wring as dry as possible, and

shake out the wrinkles. The entire process should be gone through quickly, and always on bright, drying days. This is my plan, and the best I have ever tried.

THE NECESSITIES OF LIFE.

BY MRS. LILLIBRIDGE.

The necessities of life, such as food, raiment, shelter, warmth, etc., are so indispensable to life and comfort that where we see the lack or want of them, it arouses our sympathy and thrills our hearts with pity. The horrors of slow starvation, or the death by exposure, as the cast-away upon the ocean, or the still more frequently met homeless, houseless wanderer, the foot-sore, friendless outcast, who meets no smile, no joy on earth—these vibrate each sympathizing chord of our natures, and we give of our abundance, or even share our scanty means with them. This is well. Surface sorrow strikes the eye and awakes the pitying spirit, which seeks to relieve. Would that this feeling were more general.

But how few think of the soul needs—the heart hunger—the slow starvation of the affections—the more than blight of all that renders life happy or desirable! How many maidens, forced to barter themselves for a home and find they are only unhappy wives and unwilling mothers, can attest this truth. There is an atmosphere of coldness in a loveless home—Oh! so cruel, so hard to bear. It freezes all the life-springs of endeavor, and sets a hopeless seal of discouragement upon the brow of youth, causing a poverty of spirit worse by far than the tattered garb of the street beggar. There is a sorrowing motherhood in unmated hearts and an orphanhood of soul in the offspring of such uncongenial parents. There is loneliness and desolation for those who yearn love and companionship. There is death—death by keenest of starvation.

Many possessed of wealth and fame, are writhing in torture and privation for their soul-needs are unresponded to, and their gold is but a mockery, and fame worthless to a soul who thirsts for love. Oh, no; the great necessities of life are not merely food and clothing for the body; that is well, but cannot satisfy all the aspirations of humanity. We want the blending of soul with soul, and life with life, in harmony and love. This is wealth worth possessing; this is an inheritance worth receiving. Let us cultivate it, live it, and bestow it more fully upon our children.

UP-COUNTRY LETTERS---NO. 3.

BY RACHEL A. ELY.

Fatigue, weariness of soul, discomfort, rain, mud, swollen streams and snow—all these, and a sense of homelessness, have been my daily companions the past week of travel to my retreat in these mountain hills where, in a charming little valley, I propose to tarry a while. But now that the sun shines once more, snow is gone, mud drying, and Nature smiles in her spring garments of emerald, my own flood tides are drying, hope again tips my weary heart with its golden light, and as the old aches and pains grow less under its magic touch, I calmly wait and fold my patient hands to watch if the quiet calmness of mountain air and life is truly building up wasted vitality and easing the everlasting cough which threatens to sunder soul and body. My hostess is one of the old-fashioned sort, fat and motherly, but full of duties—three men and four children beside myself constitute her family—but, by keeping steadily at work from early dawn until ten or past at night, she manages to keep ahead of her work. But wnen harvest times comes I fear she will fail. I sit and watch her by the hour (for the weather won't permit of my sitting outside yet), wondering how she can manage to keep so fleshy under such a press of work, and why, if she is truly healthy, is she so full of aches and pains. Sifting down to a breakfast table with fried bacon, hot griddle cakes, coffee, cream, fried potatoes and buttered toast, is simple enough, but yet this hearty woman eats a bit of toast and drinks a cup of coffee, and even that distresses her. To be sure, she is tired and warm with being up since four o'clock, feeding pigs, helping milk, etc, and cooking the breakfast, with the children about her wanting this and that, and distracting her mind in a thousand ways. I pity her, as I quietly lie in my adjoining bedroom and hear distinctly even the frying of the meat. No wonder she loses command of her temper, with three men watching and hurrying, but not offering to help her—all the children half dressed, and the baby crying from the cradle—the frying bacon making as much noise as any, and filling every corner with smoke, even creeping into my room. I wonder they don't open the windows and door and air the room. Can all this have anything to do with her weak digestion and gorged liver?

After quiet is restored, men are gone to work and baby sleeping, I go out, take my cup of new milk and bread, and, as I eat, watch the washing of dishes and sweeping of rooms—if it is not washing day—and I am more surprised continually to see how much and varied are this woman's duties. No sooner are the beds made, rooms swept, milk skimmed, dishes washed, butter worked or churned, and lamps cleaned—between all of which the care of the baby and the two-year-old boy and four-year-old girl must be attended to—than is the dinner to be got, with vegetables (mostly cabbage or beets), boiled salt pork and potatoes, and pudding or pie. Again the hurry and heat, and with blazing face and baby in arms she sits down to try to eat. Poor soul! a cup of tea, slice of bread and butter, or bit of pie, is all she can swallow—though she feeds the fretful baby, to keep it quiet, on pork and potato, with sips of strong tea. I wonder if such food is not one cause why the baby cries and is so troublesome—though she dont seem to be able to nurse it enough, eating so little herself.

Well, these thoughts tend to amuse me and when I gain strength I shall try to study them out, for I cannot understand these things. Do all farmers' wives work so—helping milk, feeding pigs, etc., besides so many in-door cares and inconveniences of house, carrying in water and emptying again, etc.? Her husband is kind and affectionate, but he thinks her strong and hearty, yet I know her to be ailing and hurt by the constant drain upon her system, which, I fear, will give way one of these days.

A VOICE FROM THE RURAL DISTRICTS.

DEAR EDITOR: I hear that an agricultural journal published in San Jose designs offering, for the accommodation of its numerous country subscribers, to fill orders in groceries, dry goods, or fancy articles at a small advance upon the first cost.

If yours be the enterprising company ready to help us poor dwellers in rural districts in making life more endurable, accept our most earnest thanks. Your estimable paper has been a welcome quest at our fireside ever since its first number was issued, and the valuable hints for the farmer and stock raiser, with the useful household reading, make it the *very best* paper published on this coast. Your friend and well-wisher,

HOUSE-KEEPER.

[Yes; we have really undertaken to accommodate our subscribers by procuring any articles they may order on the best possible terms as to quality and price. We do this without asking remuneration in commissions. Persons who desire to take advantage of full markets, but cannot afford to spend the time and go to the expense of traveling, can be just as well, or better served by sending orders to us for anything sold either in San Jose or San Francisco. Our arrangements for doing this business, in both places, are most complete, and will be found thoroughly reliable.—ED.]

A HOUSEHOLD LETTER.

BY MARY MOUNTAIN.

FROM "OVER THE HILLS."

One of the pleasantest things I have found in the beginning of centennial year is the improvement in our agricultural papers. When the January number of the CALIFORNIA AGRICULTURIST came to hand, we first admired the handsome, new title page, and then a dip here and there assured us that it had brought a well-furnished interior, and such variety that each one might find something especially suited for self.

It is right that farmers' papers should be sociable and in some sort familiar in style, and I am often astonished that they suit our conditions of life so well, when prepared, as they must be, amid the distracting activities of the city.

Yet here they come from out those "noisy ways,"—come dropping into homes on hill or plain, breathing the very quiet of these homes, filled to the brim with sympathy and cheer, becoming thus a part of all our lives.

Last summer, when Jewell and her advisers were agitating the yeast and bread business, it became a lively topic for us, and how free we were endorsing this, or censuring that, according to the range of personal experience! There was great temptation to snatch a pen and take a turn at "stirring the dough," or giving the obstinate loaf a "raise;" but just then we were in the midst of the "company campaign," and one must look sharp or her own cake will be dough. If we always had time to write when the fit is on, when suggestion or question has roused the wish and ability to respond, the editor would be overwhelmed with "copy" and might even cry out in dismay, "save me from my friends!"

For my own part, I never read one of our good home papers without finding something to which I would like to respond, and in your last there is so much, so much—as if each contributor had brought a "best gift" to enrich the first offering of the year. Yet we feel sure there is plenty more as good and yet to come from Grandfather, Snip and Jewell, from Up Country Letters, Busy Bee, and brisk Nell Van, who can turn her hand to anything. To her I looked up with the profound respect that is due to one who can calmly and gallantly lead in the upper ranks of hygiene. How, then, can I describe the tremor of doubt and dismay that seized my mind as I stepped one morning inside her gate and sniffed—doughnuts! Nell Van frying doughnuts! I could as easily imagine "Watercure Trall" inside there eating them. However, that "smell may come from the neighbors." So I "composed myself," as Sairy Gamp would say, and rang the bell as if nothing had happened. But inside the door it smelt nuttier than ever, and I could not help asking the gay little woman, "Is it possible, Nell Van, that *you* fry doughnuts?" And she answered, truthful as George Washington, "O, yes; once in a while!" So I had something to think about as I came home, and was very glad I had caught her at it. For, although I read papers that do denounce doughnuts (and some deserve this ill name), yet I continue to make them in the winter, "to please my husband," and then, very kindly, I help to eat them up; for they are plain and light, no more greasy than a piece of bread and butter.

There are two prime faults that spoil a great many doughnuts. Fault No. 1—Made up too rich, or two soft, and sure in either case to soak fat. Fault No. 2—Fat not kept at boiling point. Must be boiling (not burning) all the time.

A receipe for doughnuts in your January number is very good, I should think, if the butter were left out. It seems as if any grease mixed in the dough opens wide doors for the entrance of more grease while the cakes are frying. If mixed with skim milk, a very little cream may safely be added, and buttermilk will do for mixing if not too buttery.

Domestic.

FAMILIAR TALKS---No. 6.

BY SNIP.

BEFORE I commenced gardening I thought there was more fun than work about such an occupation, but have come to the conclusion that it is just the other way—especially when one has a piece of work nicely finished and suddenly finds it must all be done over again. For instance, last month, thinking one day it was going to rain, I hastened to set out nearly a hundred cabbage plants. The storm did come, and before it was over, part of the garden fence blew down, and before it could be repaired the chickens destroyed the plants. I have an idea they were better natured about that than I was when I had to set out another lot. But in spite of all discouragements and drawbacks, I enjoy the work; for while I am putting the dry seeds into the warm earth and watching the tiny plants springing up, I enjoy, in anticipation, as I shall in reality after a while. The nice, fresh vegetables I will have next summer independent of the vegetable peddler. Of course, it will take work and time and care, but do you not think I shall be well paid by being able to gather vegetables fresh and crisp? Last season, during a visit to a friend in this valley, I went with one of the girls to get some tomatoes. On entering the garden, I looked around to see where they were, and finally saw them pulled out of the weeds which were in greater abundance than the vegetables. "Do you raise many vegetables?" I asked. "No; somehow they do not do very well." I should think not. On a farm of 160 acres a small garden was fenced in, and one-third of it occupied with Mission grape vines that did not furnish enough fruit for the table, and of course none could be canned or put up in any way for winter. The remainder was used for vegetables, but as they received but little cultivation, and weeds will grow without it, the latter were in greater abundance than anything else. With a good artesian well on the place, not a particle of

water was turned to the garden. "To what use do you put that stream of water?" "None at all." Although the same man has owned the place for sixteen years, he put out last season, for the first time, some evergreen trees. With plenty of water, these trees had to be watered by hand—the water carried all of two hundred yards in pails. All the water for the house, and for washing, had to be carried still farther. When the chickens were not laying they were not fed, because "there was no profit in feeding" them then; and when they laid, why, they were "doing well enough on what they picked up." As a matter of course, chickens don't pay on that farm. The cows are milked anywhere from five o'clock to ten in the evening. There is butter on the table only half the time. "Cows don't pay without green feed;" but no effort is made to supply such feed. The boys are leaving home as soon as they are old enough, and the girls learning trades. This, as many a one in California can testify, is not an exceptional case. Is it because nature is so lavish that people think *no work* or carefulness is needed?

In strong contrast to this picture, another arises before my mind's eye, viz: farming in the old Keystone State. The outside things were different. The farm in good order, fences in perfect repair, a large, commodious barn, well filled. Instead of one or two cows to furnish milk and butter about half the year, five to eight and ten was the number found on nearly every farm, and a tub of butter for market every week. Every farm had a large garden and a good orchard. The farmer carried berries of nearly every kind to market, with apples, potatoes, beans, and nearly every week a basket of eggs. In the winter turkeys and chickens were sent off by dozens. True, many of the farmers were what people here would call "old fogies," but as a general thing they were intelligent, and once convinced that a new idea was a good one, *that* was the right way to do ever after.

I do not wonder that Eastern people are in ecstacies over California when they come here in the winter. Two days ago I had a letter from Baltimore in which the writer stated that the weather was bitterly cold and it was dangerous to venture out because of the ice. To-day, the 14th of February, is too pleasant for one to remain in-doors. Bright and warm, at least it is here in the mountains, the air pure and bracing, everything green and fresh, the wild flowers springing out of the warm ground—is it surprising that the first settlers here called it God's own country?

But you have such terrific storms in the mountains. Well, suppose we do. Do you not think we appreciate pleasant weather when it comes? We are free from fogs, have an ever-changing picture of beauty before us, for we can look over an area that you dwellers in the valley cannot see one-tenth of at one time. The air is pure and free, and we are healthy and free, too. Not so entirely shut out from the world as one might think, for we have the best of companions—books and papers.

THE GENIUS OF THE KITCHEN.

BY MRS. E. M. ABBOTT.

Yes, dear reader, why not? If we have always associated the word *genius* with those who excel in the arts and sciences, back of all these there is an army of presiding geniuses, who require for the faithful discharge of their duties and responsibilities, a talent more varied and a labor more complicated than that of a Raphael or a Hogarth, Who will deny that the faithful housewife is guiding a pencil which paints life-pictures more beautiful than those of a Guido.

The kitchen which we have in our mind's eye is not the separate hut, as at the South, where the "help" preside as of old, and which the wealthy mistress never sees the inside of from one month's end to the other; neither is it the California kitchen (where the Mongolian is the caterer and man of all work for a consideration in gold coin), built in shanty style of rough redwood boards, with one window looking out into the back yard; but the New England kitchen, with its sanded floor, in a large wing of the main building fronting the street, spacious, neat, airy and sunny, the throne of the wife and mother, where her large family have arisen to call her blessed, where her radiant face bent over the little cradle as she kept time with the rocking in a sweet lullaby, the constant accompaniment of her manifold labors and duties. The evening is occupied with her knitting-work, her only resting-spell, which she alternates with helping the boys in their "examples" in arithmetic and the girls with their sewing and embroidery. If this is a fancy sketch at the present day—the commencement of the Centennial year, a half-century ago it was true to life. The presiding genius of the kitchen was also the inspiring genius of the home, the central magnet and heart, which was eminently a position of honor if not of power. If the average woman of the present day cannot sit for the portrait herein drawn, we will not say that it is due to degeneracy, or that they are not as intelligent, refined and noble-minded as their mothers and grandmothers were; but that habits, tastes and opportunities, which are in the legitimate order of progress, have changed with the cycles of time. True, some apparently for the worse, but in the main we have added to the storehouse of knowledge, which in turn has "sought out many inventions" whereby bone and sinew labor have been lightened, thus adding to the means and opportunities of obtaining useful information, which in olden time was considered, for woman at least, superfluous. The time has come, and let us be thankful, that she can, in addition to those home duties which are first in importance, do even those better by participation in cares and objects outside. The one point conceded by every intelligent mind is the necessity of *education*. Not a smattering of reading, writing and arithmetic, but in its broadest and most liberal rendering. This change has been wrought by a comparative few, at a sacrifice of wealth, reputation and friends, by hard work, with no pay but hard names. But who will argue for a moment that the change has not been for the better for both men and women. After obtaining an education it is not in the nature of things for woman to rest satisfied without putting it to practical account, for every step towards enlightenment is only a suggestion for a further demand, and she is no longer looked down upon by men from an eminence on which experience alone, and not ability, placed them. A new age and era have come, which were as inevitable as the law of gravitation, and that which once had the name of fanaticism is now *common sense* and nothing more or less, and that is a very good thing to have in abundance. Among other things women have learned that the everlasting knitting-work is not their *normal state;* and men are no longer satisfied with wives who know nothing beyond the cooking stove. The genius of the kitchen may also be a genius in the arts and sciences.

San Jose, February, 1876.

CHOICE RECIPES.

CONTRIBUTED BY LADY CORRESPONDENTS.

Ginger Sponge Cake.—One cup of molasses, one of butter, two of brown sugar, four of flour, one of hot water, four eggs, one large teaspoonful of soda, two tablespoonfuls of ginger. Bake in a moderate oven.

Plain Railroad Cake.—One tablespoonful of butter, one cup of sugar, one egg, one and a half cups of flour, two-thirds of a cup of milk, half a teaspoonful of soda, one teaspoonful cream of tartar.

Lemon Pie Without Lemons.—Two tablespoonfuls of vinegar, one of flour, three of water, four of sugar, and one teaspoonful of extract of lemon.

Good Breakfast Cake.—Cold mashed potatoes mixed with flour and rolled out and cut into biscuits are very nice and healthful.

Oatmeal and Cocoanut. — Oatmeal mixed with grated cocoanut makes a very attractive cake to both old and young. Take three heaping teaspoonfuls of grated, or two of prepared dessicated cocoanut; add to it half a pint of fine oatmeal and two heaping teaspoonfuls of sugar; stir into it one gill of boiling water, and mix thoroughly together; turn it out on the rolling board, roll thin, and cut out as for common crackers. If wanted very nice, put a piece of citron and half a dozen currants into each cake, sticking them into the dough. Bake in a slow oven, and watch carefully lest they brown a shade too deep. To make crispy, let them stand a day or two in an uncovered dish.

A Nice Dish.—To cook fine hominy, boil with considerable water until soft, and thicken just before serving with corn starch dissolved in cold water.

Graham gems, with cocoanut and sugar added, are also an improvement on plain gems when eaten cold.

Graham Flour Puffs.—One quart of sweet milk, two eggs, flour to make a thin batter; fill the gem pans two-third full, and bake in a quick oven.

Mashed Potatoes.—Mashed potatoes are very nice with only salt and *sour* cream added. You will find it better than sweet cream to use.

To make nut cake, take one-half cup of butter, one and one-half cups of sugar, two cupsful full of flour, three-fourths cupful of sweet milk, one cupful of nut meats, two eggs, or the whites of four, one teaspoonful of cream tartar and one one-half teaspoonful of soda.

Women.

SOMETHING ABOUT WOMAN'S SUFFRAGE.

AGAIN women citizens of the United States have memorialized Congress, this time asking the right of suffrage in the District of Columbia. Why the "white men" who represent us—or pretend to—don't give up and let the women vote, is more than we can account for. Surely every man born of a woman should know that when a woman makes up her mind for a thing she will accomplish it sooner or later. This matter of suffrage for women is only a question of time, and that time can only be gauged by man's perverseness and stupidity. Here is a string of "whereases" and a "therefore" in substance as set forth:

Whereas, the United States Supreme Court has decided (in the cases of Spencer vs. The Board of Registration, and Webster vs. The Judges of Election of this District,) that by the first section of the Fourteenth Amendment "women have been advanced to full citizenship, and clothed with the capacity to become voters," and further, that this section does not execute itself, but requires the supervention of legislative power in the exercise of legislative discretion, to give it effect; and whereas Congress made an unjust discrimination in giving suffrage to colored men in the District of Columbia, and refusing to give it to women—thus depriving the intelligence and moral power of citizens of said District of a fair opportunity of expression at the polls; and whereas woman suffrage is no experiment, but is universally admitted to be successful in Wyoming, which has been redeemed from lawlessness through it; and whereas, a fair trial of equal suffrage for men and women in the District of Columbia, under the immediate supervision of Congress, would demonstrate to the country that justice to woman is policy for men; and whereas, "the woman citizens of the United States are governed without their own consent, are denied trial by a jury of their peers, are taxed without representation, and are subject to manifold wrongs, resulting from unjust and arbitrary exercise of power over an unrepresented class;" and whereas, this is the centennial year, when the spirit of '76 is breathing its influence upon the people, melting away all prejudices and animosities and inspiring in our national councils a clearer perception of individual rights; therefore, the memorialists pray Congress to establish a government for the District of Columbia which shall secure to its woman citizens the right to vote.

One of the strongest petitions of this kind ever offered was placed before Congress, in 1873, by Dr. Mary E. Walker. Among a host of reasons why suffrage should not be withheld from woman, the doctor urged the following strong point:

"The equality of the rights of women with men, when the Constitution was framed, was not questioned by our forefathers, for *women were at that time voting* in the State of New Jersey, and *continued to exercise the right for two generations,* without their constitutional rights ever having been questioned, *clearly proving* that it was the intention of the fathers to secure such rights to women as well as men. The fact that the women did vote unquestioned, proves *the spirit* of the Constitution, for it was in the time of its framing, and while its framers were *all living,* and ready to explain the spirit of the same."

Authentic reports from Wyoming show that great benefits have resulted from women's power to over-balance such evils as politically curse the communities where they are denied the ballot.

We cannot close this article without calling attention to the fact that a sister republic on this continent recognizes that woman has a right to her rights, at least politically, and no foolishness. Read the annexed on woman suffrage in Chili:

"A curious question has arisen in some towns in Chili on occasion of the inscription of citizens in the electoral registers. At San Felipe one woman presented herself for registration, one at Casablanca, and ten at La Serena. As the law makes no distinction of sex, and as the only qualifications required for citizenship are to have attained one's majority and possess a knowledge of reading and writing, the Boards decided to register said representatives of the weaker sex, so that at the coming elections women will be admitted to vote."

Correspondence.

DEEP PLOWING.

BY MECHANIC.

Ed. Agriculturist: The correspondence on this subject, in your last issue, reminded me of the fact that I had promised you an article on the same subject, and I propose to state facts, as they have come under my observation, believing demonstration to be the crowning point of theory.

In the famous Genesee valley (when it was new) some of the most successful farmers were advocates of shallow plowing, which succeeded for a time in producing fine crops. In a few years the shallow surface appeared to be exhausted of its fertility and produced very light crops, when deep and thorough pulverizing of the soil, to the depth of ten or twelve inches, again produced heavy crops.

The old, worn-out fields of Montgomery county, and other counties of Maryland and Delaware, in 1848, could be bought for 75 cents to $1 50 per acre. Shallow plowing and repeated cropping wore out the surface, and deep plowing —with a little guano for the first two or three crops, and the straw of the crops returned to the soil, with a little lime for a solvent—made the worn-out fields more productive than when the land was new.

I saw an old field of sixteen acres, in Jackson county, Ill., planted to corn in 1866: The field had been worn out by shallow plowing and repeated cropping with corn. Four acres of the field were plowed thirteen inches deep, three acres five inches, and the balance nine inches deep. The whole was thoroughly pulverized, but no manure was used. It was all planted in corn, on the same day, and all tilled in the same manner. Wheu the corn was ten inches high there was a rain of 4.26 inches in forty-eight hours, and no more rain until the crop was matured. The yield was eighty bushels per acre on the part plowed thirteen inches deep, forty-five bushels on that plowed nine inches, and about five bushels of "nubbins" on the five-inch plowing.

In 1867 there were sixteen acres summer-fallowed and thoroughly pulverized to a depth of fourteen inches, on an old farm of 170 acres on the Bois Brule bottom, about eighty miles below St. Louis, on the Mississippi river In the Fall it was ridged for corn and planted in the Spring—the first of April. The balance of the farm was plowed in the Spring twelve inches deep and planted in corn. The farm was settled by the French at the time of the settlement of Koskoskia, about 1666. It had never (before) been plowed over four inches, and repeatedly cropped in corn. The place had been rented for several years for ten bushels per acre, yet seldom raised enough to pay the rent; but in 1867 the ground and corn was thoroughly tilled, and the yield on the summer-fallow was 165 bushels per acre, and 80 bushels per acre on the spring plowing.

I came to Marysville, California, in April, 1871. I had a letter of introduction to Wm. P. Harkey, of Sutter county. Mr. H. showed me his wheat field, which had been summer-fallowed and thoroughly pulverized the previous summer to the depth of eight or nine inches. The wheat looked healthy and vigorous, notwithstanding the bed rock was near the surface and the wheat in the neighborhood a failure. This deep and thorough tillage yielded about twenty-five bushels to the acre.

Moze Ellis, of the Placer Mills, Marysville, had a farm not far from Mr. Harkey's, but nearer the Buttes, and deeper to the bed rock. Mr. Ellis informed me that he had a piece of wheat that season which was summer-fallowed twelve inches deep, and yielded thirty-five bushels to the acre. Mr. Ellis also informed me that the same dry season he tilled a piece for grapes *very* deep and thoroughly, and that he could, with one scrape of his foot, reach moist dirt any time in the summer.

I have given the successful experiments above mentioned as correctly as my memory serves me. If I have made any mistake, it can be ascertained in the last two cases by an appeal to Messrs. Harkey and Ellis. The former is now Sheriff of Sutter county, and the latter owns and runs a flouring mill at Tehama. Send them this communication, and ask them wherein I have erred.

A few more remarks, and my long article will close. First—From forty-two years of close observation, with much of my time spent in farming, and being an earnest advocate of deep and thorough culture—with all this, I am free to admit that there are two sides to this question. For instance, where virgin soils are very open and fertile, as in the Genesee valley and California, shallow culture often produces fine crops until the ground becomes packed by repeated cropping and working.

Second—I have noticed, in some instances, in California, that where land was plowed deep and the clods not pulverized by rain or thorough culture, the crops suffered much more from drouth than similar land that was tilled shallow and made fine.

Third—I have had the best success by deep and thorough culture for small grain, as well as corn, and found the roller, after seeding, beneficial; but when the top became tight, by rain after rolling, and liable to bake, the trouble was remedied by a thorough harrowing with a fine-tooth harrow, with the teeth well slanted back to prevent tearing up too much grain. What grain was torn up by the harrow, was replaced by the extra stooling of the balance. The harrowing, making the surface fine and loose, makes a good mulch to prevent the escape of moisture from below. I have tried this with wheat twelve inches high with benefit.

Fourth—I have often taken pains to discover the depth to which the roots of small grain penetrate the earth, and where the soil was loose and thoroughly tilled have usually found them at the bottom of the furrow, and often struggling (in a dry soil) to go deeper. There is no danger of tilling good corn land too deeply, and it is important for corn, if you desire thick stalks and large ears, to plow deep, pulverize fine, plant early, work the ground deep and often while the corn is young, and when the lateral roots start deep the surface fine until the corn shades the ground. If the soil and climate are good you have nothing further to do, except to harvest a large crop in the fall.

Every farmer who has corn land should make corn one of his rotation of crops, and feed it to hogs or other stock, and return the manure to the soil. I am very skeptical about the inexhaustible fertility of any soil when repeated cropping is the rule and no return made to the soil. Compensation is the universal law of nature, and it is easier to impoverish a good soil than to renovate one that is worn out by bad farming.

Whatever promotes a comfortable and harmless state of mind promotes health.

TREE CULTURE.

Friend Herring:—Your valuable paper has given hints and instructions on nearly every point in farm and garden matters, but I don't remember anything in regard to the *best kind of pears to graft on the quince*. I read some time ago that it was not best to graft Bartlett on quince stalk, but no reasons were given. I wish to graft a lot of seedling quince (set in place), and would like to graft some to Bartlett. If convenient, please tell me in March number if there are any real objections to Bartlett, and what are the best varieties to dwarf. I would like to know if there is any fruit I can successfully graft on white mulberry stalk.

The more experience I have with seedling trees, the better I like them. Where it is anyways difficult to start an orchard a tree that will not throw up an abundance of suckers is worth only half-price. Many of our long-shanked, smooth-bodied, short-root-grafted trees will not sprout about the trunk unless injured by some damage to the top or depredations of borers; then Mother Nature makes one more desperate endeavor to assert her rights, and shade the trunk in her own unrivaled style. The orchardist and gardener should assist rather than defeat Nature. I don't know a single point in favor of a small, suckerless tree.

A good growth of small suckers is a great protection from the many accidents to which even well cared for trees are liable, while the trunk at and near the ground will be better shaped and tougher in fiber for their attachment to it. As much *root* is made to develop a foot of sucker as a foot of limb, and by the time the root is all needed to sustain the top and fruit, the tree will be able to dispense with the sucker. Nature almost invariably starts her most stalwart trees as bushes. Any one who has taken out oak grubs knows what fine, loose, moist soil is found close about the stump. The close overhanging green bush has gathered moisture from every dew, and the leaves and grass have rotted and enriched the spot they could not be blown away from. It is only in close, moist swamps that trees naturally run up without sprouts from the root.

There has been so much written and said about the slovenly look of suckers around trees and the beauty of tall, straight trunks, that I feel I am on dangerous ground. I can hardly blame any one for casting admiring glances at a solid, Samson-built, mature man in close fitting pants; but will any sane person say that the immature, spindle-shanked boy, in short coat and tights, is a thing of beauty? But the young lady, with her drapery gradually increasing in diameter from the waist to the ground, is shaded and protected on natural principles. May fashion, in the near future, revive the *hoops* and leave off the *pullbacks*. Nature will revenge herself for every sin and indiscretion against her laws. I expect she has allowed the pullbacks as a punishment to us for saying and writing so many hard things about the way she starts, protects and develops her young trees.

C. A. W.

Cozy Nook, Feb. 9th, 1876.

REPLY.

The objection to grafting the Bartlett pear on the Quince is, that even on a strong pear stalk it is a delicate grower—makes a slender tree. On the quince, which still more reduces the vigor and flow of sap, it has not enough vitality to make a handsome tree or produce good fruit. The strongest growing pear trees seem to do the best upon the quince. The Easter Buerre, Duchess and Winter Nellis have been proved to do well upon the quince. Such varieties of pear as make a good deal of sap wood on their own stalks will, by becoming dwarfed, produce fruit more prolifically and sometimes of better quality on the quince than on pear roots.

2. The only thing that will pay to graft into the white mulberry, so far as we know, is Downings ever-bearing variety. This makes a very nice fruit, as also a fair ornamental tree.

3. Although many orchardists might call the allowing of suckers to grow very slovenly, yet we believe it would be better than the close pruning that many of them give their trees. We know of some who rub off every bud and trim off every side shoot as if they were enemies instead of friends to the health of the tree. Our advice is, don't rub off a single bud from the trunk and lower limbs. Let every one grow; but keep them nipped or cut back so short that they do not get too much in the way. If a tree has its entire trunk sheltered by a growth of suckers and spurs it will grow all the healthier and stronger for it. We would encourage them to grow, and make fruit spurs from the ground up.

EXPERIENCE OF A BUSINESS MAN AS A FARMER.

Many men in business, vexed with cares and confinement, sigh for the freedom and independence of the farm. They have sometimes looked upon a cabin, with its smoke curling quietly up towards the heavens, and envied the occupants whom they fancy to be free from care and trouble, and they would almost sacrifice their luxuries for such quiet and like them

"Keep the noiseless tenor of their way."

They are apt greatly to over-estimate the profits of farming in the rather limited way that they propose to engage in it, for they intend to make it a sort of pastime. Many have tried the farm to find that they have only fled from one sort of trials to another, and the man of more muscle and more experience may smile at their complaints.

I take the liberty to extract from private letters of one who, rather late in life, has left active business engagements for the farm. He says:

"I have been very busy with my farm work, and, while at work, your remark came forcibly to my mind that 'a man working at farming has to do more work for a dollar than in any other business.' It is but a few bushels of potatoes that a man can dig in a day, and when dug they cannot be sold at any price at present. Now I am prepared to say that there is more disappointment in farming than in any other business on this earthy footstool, and any man who knows enough to lick molasses off a smooth stick had better never engage in farming. Cain, I believe, was the first farmer, and for his crime divine wrath has rested on farming ever since.

"In the first place, you have the fowls of the air, the beasts of the field, and all creeping things to destroy your crops. Secondly, you have the elements to contend with; if there is too much rain, or too little, your crops will be destroyed; and what seems to be the most provoking part of the whole thing is, that while you have been striving against all the above judgments, and your poor crops look withered or decayed, the worthless weeds by their side are green and flourishing, holding up their heads with rejoicing. Lastly, and finally, if by any chance you escape any or all of the above calamities and raise a good crop, then the price is down and you get nothing.

"Brother J., buy the ——; buy anything; get a clam hoe, and go on the top of Mt. Diablo and try to dig clams there, but don't buy a farm with the idea of ever making anything at farming. With me it was not so; when I bought my place I did not expect to make one cent —not a red—and I have succeeded so well that I have no reason to complain—feel very much encouraged."

SAN JOSE, February, 1876. C.

NEW AGRICULTURAL PATENTS.

Issued by the United States Patent Office from Jan. 11th, to Feb. 11th.

[Reported for the CALIFORNIA AGRICULTURIST by Louis Bagger & Co., Solicitors of Patents, Washington, D. C.]

Hay loaders—Jno A Bower, Eureka, Kansas.
Grain binders—C G Crouse, Sun Prairie, Wis.
Machines for untying bands on cotton bales—S H Gilman, New Orleans, La.
Machines for punching and shearing cotton bales—S H Gilman, New Orleans, La.
Cradle fingers for scythes—W Hamilton, Fallsburg, N Y.
Hand plows—M Y Thompson, Arkadelphia, Ark.
Machines for twisting hay or straw—Addison A Wells, Iowa Falls, Iowa.
Bean threshers and separators—C S Hall, Rochester, N Y.
Beater-reels for threshing machines—C S Hall, Rochester, N Y.
Horse-rakes—Wm J Lane, Millbrook, Port Chester, N Y.
Corn planters—A C Burgner, Charleston, Ill.
Horse-rakes—Orlando Clarke, Isaac Utter, Rockford, Ill.
Plows—Wm A Estes, Chevia, Mo.
Tooth fastenings for horse hay rakes—T A Gait, Sterling, Ill.
Corn planters—T A Galt, Sterling, Ill.
Apparatus for manufacturing fertilizers—H O P Lecoguay Puntin, near Paris, France.
Corn coverers—Thos B McChesney, Hamersville, Ohio.
Hand corn planters—Milton Pollock Koel, St Cloud, Minn.
Harrows—J Van Ortherick, Hillsdale, Mich.
Potato diggers—P M Bawtinhimer, Woodstock, Canada.
Bands for binding grain—David Olmsted, Minneapolis.
Grain binders—Wm R Baker, Chicago, Ill.
Harvesters—Peter Kline, Lisbon, Iowa.
Grain bags—C Lazarevitch, Brooklyn, N Y.
Plow points—W B Ready, Sacramento, Cal.
Harvester rakes—T H Bacon, Hannibal, Mo.
Machines for making grain conveyer flights—H I Chase, Peoria, Ill.
Harvesters—Jas B. Mohler, Pekin, Ill.
Harrows—Jas B Oakey, Indianapolis, Ind.
Harvesters—Wm F Coehrne, Lafayette, Ind.
Corn planters—Levi Scofield, Grand Haven, Mich.
Cutting apparatus for harvesters—Frederick H Wolschlaeger, Bensonville, Ill.
Churns—Eli F Beard, Republic, O.
Apparatus for steaming food for stock—R Dalley, Quincy, Mich.
Reaper reels—S Hamilton, Mount Sterling, Ill.
Cotton seed planters—J C Jenkins, Lebanon, Tenn.
Corn Planters—S P Babcock, Adrain, Mich.
Cultivator teeth—J C Bannigan, Umuleith, Ill.
Milk coolers—Langdon Clark, Crary's Mills, N Y.
Straw cutters—Levi Cossit, Guelph, Canada.
Plow handles—Wm A Crouch, Hannibal, Mo.
Gang plows—Enoch C Eaton, Pinckneyville, Ill.
Churns—D L Epperson, Mill Shoals, Ill.
Band cutters and feeders for threshing machines—G L Gearhart, Lebanon, Neb.
Bee hives—Wm B Hamilton, Glasgow, Ky.
Hay rakes and loaders—Geo Lambert, Hill Grove, O.
Fence posts—Lake Lightfoot, Walnut, Iowa.
Fence posts—Archibald Taylor, Keecketon, Va.
Combined land rollers and grass seeders—F M Dowling, Ida, Mich.
Corn planters—Sol F Holly, Rockford, Ill.
Processes of manufacturing fertilizers—L Stockbridge, Amherst, Mass.
Torsion springs for harvesters—R Dudley, Erie, Pa.
Grain Separators—Henry B Stevens, Buffalo, N Y.
Compositions for preserving eggs—Abigail S White, Chunchila, Ala.
Hay stackers—Moses Amidon, Lathrop, Mo.
Churns—Henry T Davis, Sherman, Tex.
Cutter bars for reapers and mowers—Thomas Henderson, Baltimore, Md.
Cotton seed Planters—Wm Jarrell, Humboldt Tenn.
Wheel cultivators—Benj W Reney, Brookville, Ind.
Harrows—Bardon W Taylor, Roseville, Cal.
Harvesters—Wm N Whitely, Springfield, O.
Harvester rakes—Wm N Whitely, Springfield, O.
Combined stack and feed cutters—Isaac S Wilson, Waldo, Mo.

A STUPENDOUS FRAUD.

Before our present Legislature put their hands into the people's pockets for twenty thousand dollars, or any other sum, wherewith to pay the debts of that gambling institution known as the State Agricultural Society, they ought to weigh well a few facts.

It has long been apparent to all who have given the subject a thought, that the State Agricultural Society, although a perpetual stipendiary upon the people's bounty, has been so conducted as to make every legitimate interest for the promotion of which such societies are supposed to be organized, tributary to and productive of that most seductive of all gambling games—pool-selling. As conclusive evidence of this fact we need but refer to the report of the Society for 1874. That year the Directors awarded to the horse-racing department, as premiums for speed, the sum of $16,330. Deduct ten per cent. entrance—$6,750—and the amount given outright for the encouragement of this species of agriculture(?) was $9,850. For other than racing money there was given that year to the horse department the additional sum of $2,315, making a net total for the horse of 11,895. We now consult the same report to see what was done to encourage the breeding of fine cattle, and find that the total amount of premiums awarded that year for all classes was the meager sum of $1,839!

The recent resignation of Col. Younger as a member of the Board of Directors of the Society leaves the entire southern portion of the State, south of San Francisco, without a representative in the Board. For the five years he had occupied a seat there he had earnestly endeavored to prevent the encroachments of the pool-selling interests upon the legitimate purposes of the Society. An extensive Short-horn breeder himself, he represented the great cattle interests of the State. He was one one of the largest exhibitors at the Fairs, and without his stock, together with that of such men as Ashburner, Emerson, Quinn, Clark, Jones, Carr, Boots, Hamilton and many others, all from this section of the State, our State Fairs would have have been very slim affairs indeed. The people had a right to expect, in view of the important industry he represented, some little consideration from the Society—the right to insist that horse-racing and pool-selling should not swallow up every other end and aim of the Society. But they found their representative in a hopeless minority of the Board, out-voted at every point. Hence, when the Society elected, a few weeks since, the editor of a horse-racing journal, whose business partner is at the head of the pool-selling evil of the State, to a Directorship, against his wishes and the wishes of all who had the best good of the Society at heart, Col. Younger thought he might as well quit. And so may the cattle men of this section of the country as well quit, and henceforth let the ring of blacklegs, into whose hands the Society has fallen, run it to their hearts' content.

Those who have never visited our State Fairs can have but a poor conception of the extent to which gambling is carried on in connection therewith. Thousands of the young men of the State are there brought face to face with a form of gambling more dangerous, because more enticing, than faro, roulette, or cut-throat monte. Respectable farmers, who never wagered a dollar in their lives at a horse-race, are found bidding at the pools. Under the guise of an agricultural or stock exhibition, the State becomes a "capper" for a stupendous system of gambling, "roping in" thousands to their ruin.

Isn't it about time that this condition of things ceased? Or, if it must continue, that the State withhold its countenance, and the Society be compelled to sail under its true colors and be known by its true name—"Society for the Promotion of Pool-selling."

We are aware that certain journals have intimated that Col. Younger's resignation is in keeping with the supposition that the southern stock breeders are moving to take the State Society away from Sacramento. We know that this is not true. Surely San Jose does not want it. We have a better society and more valuable property of our own. We would see the State Society remain where it is, but divested of the excrescences which have fastened themselves to it.

The foregoing from the San Jose *Mercury* is just about what we wanted to say upon this subject; only our own local Society needs as radical reforming as the State Society does. We are glad to see that a sentiment is growing in favor as to the right use of agricultural societies. Probably no paper in existence has labored for it more earnestly than the CALIFORNIA AGRICULTURIST, or been worse abused for such work. We believe in commencing this reform right at home.

SEEDS. SEEDS.

THOROUGHBRED SPANISH MERINOS FOR SALE.

SIXTY ONE AND TWO YEARS OLD—Thoroughbred Spanish Merino Rams, California bred, from Ewes imported from Vermont, and sired by Severance & Peet's celebrated ram FREMONT, and by their ram GREEN MOUNTAIN, which took the first premiums at the Bay District and State Fairs. Last shearing, 35¾ lbs, year's growth. Also, about 100 Ewes and Lambs, all of GREEN MOUNTAIN stock, bred last year.

B. F. WATKINS, Santa Clara, Cal.

SAN JOSE INSTITUTE
—AND—
BUSINESS COLLEGE!

A Day and Boarding School for Both Sexes.

THE SECOND SESSION OF THE CURRENT School Year will commence January 3d, 1876.

In acknowledging the kindness of the patrons of this School, the Proprietors desire to assure them that with the increased patronage will be added increased facilities for imparting instruction. They intend that the School shall offer the very best opportunities for acquiring thorough education, both theoretical and practical.

The conrse of study in the Academic grade is extensive and thorough.

The Business College has no vactions.

Students from a distance will find pleasant rooms and board at reasonable prices at the boarding-house.

The Faculty accept to its fullest extent the growing demand of the industrial classes for recognition in the public educational system hailing it as the harbinger of a higher and better civilization.

ISAAC KINLEY,
Superintendent of the Institute.
JAMES VINSONHALER,
Principle of the Business College.

1865. 1876.

HANNAY BRO.'S Nurseries.

WE, THE UNDERSIGNED, HAVE BEEN engaged in the Nursery Business for the last ten years in San Jose, and our chief aim has been to grow and produce only the very best varieties of Fruit Trees, and those of a healthy growth, and such trees as will give satisfaction to our patrons. In order that purchasers may know our varieties, and also our prices at wholesale or small lots, we give the following:

ONE YEAR OLD TREES.		TWO YEAR OLD TREES.	
	Per 100.	Per 1000.	Per 100.	Per 1000.
Apple.....	$12	$100.	$20	$150
Pear.....	20	160	38	280
Prune.....	22	200	30	---
Plum	20	180	28	250
Cherry	22	180	30	260
Peach	22	180	---	---
Nectarine..	25	---	---	---
Quince	20	---	---	---
Almond....	20	---	---	---
Apricot.....	25	200	---	---
Figs.....	---	---	20	---
Currants...	5	---	---	---

We also offer a large assortment of the leading kinds of Ornamental and Evergreen Trees. Purchasers who wish choice grown trees are invited to visit our Nurseries and examine our stock, as we know their character and healthy growth will please them. Persons unknown to us, that order trees, should send the cash or good reference, in order to secure their trees.

Our Nursery is situated upon Julian street, one mile east of the Court House.

HANNAY BROS.

The American Bee Journal,

Established in 1861 by the late Samuel Wagner, at Washington, D. C., is now published Monthly at CHICAGO, Ill.

Every Beekeeper should Subscribe for It.

IT IS THE BEST SCIENTIFIC AND PRACTICAL Journal of Apiculture in the world. The most successful and experienced Apiarists in Europe, as well as America, contribute to its pages. In fact, it is the **oldest, largest,** and one of the most **reliable Bee Papers** in the English language. Terms—$2 per annum. Send a stamp for a Sample Copy. Address,

THOMAS G. NEWMAN,
196 & 198 South Clark St., Chicago.

THE TRUTH ABOUT

THE DAVIS

VERTICAL FEED

SHUTTLE SEWING MACHINE.

IT DOES NOT TAKE AN HOUR TO get ready to do a minute's work, but is always ready in a minute to do a day's work.

The Favorite of the Family circle. Runs more easily and quietly than any other machine.

The DAVIS presents these advantages: It prevents pulling or gathering of goods, will sew over thick seams, or from one thickness to another, without change of stitch or tension, and make the most Elastic, Durable and Uniform Lock Stitch of any Machine before the public.

The only one having an Automatic Bobbin Winder, and the most wonderful attachment for making the Knife Plesting.

The peculiar feature of the DAVIS is its VERTICAL FEED, which is essentially different from any other Machine manufactured, requiring no acquired skill to operate it, nor basting of the goods, and all should give it an examination at least before purchasing any other.

After six weeks' trial at the Franklin Institute Exhibition, held at Philadelphia in 1874, it was

Awarded the Grand Medal Against Nineteen Competitors!

And has universally been awarded the FIRST PREMIUM at all principal Fairs where exhibited.

We have the best manufacturing machine in use.

Energetic and responsible Agents wanted in all unoccupied territory.

For further information, circular and terms, call on or address

PROCLAMATION.

Chicago & Northwestern Railway.

Is the popular route overland to the East.

Passengers for Chicago, Nisgara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their trans-continental tickets via the pioneer route,

THE CHICAGO & NORTHWESTERN R.R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fort Wayne and Chicago and Pennsylvania Railways.

Through trains daily, with Pulman Palace Cars through to Philadelphia and New York on each train.

THROUGH TRAIN, WITH PULLMAN PALace cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (New York Central and Erie Railways):

THROUGH TRAINS DAILY, WITH PALACE Drawing Room and Silver Palace Sleeping Cars through to New York.

By the Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways:

Through trains, with Pullman Palace Drawing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

By the Baltimore and Ohio Railroad:

Through trains daily, with Pullman Palace Cars for Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace sleeping cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through cars to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento, and in all the Ticket Offices of the Central Pacific Railroad.

THE CAL. AGRICULTURIST PUB. CO. have constituted themselves a **Purchasing Agency**, to accommodate Agriculturist subscribers. Anything wanted in San Jose or San Francisco purchased at lowest rates for cash, and forwarded to order **Free of Commission.**

THE CAL. AGRICULTURIST PUB. CO.

ANNOUNCE TO SUBSCRIBERS OF THE "AGRICULTURIST" that they have made arrangements whereby they can supply almost any desirable book published upon any subject, at publishers' prices, postpaid, upon receipt of its price. People living in the country, away from book stores, have experienced difficulty in getting what books they want at any price, and are frequently imposed upon when they do get books. Now, we propose to remedy this matter entirely, and without further trouble to our patrons than the sending of their orders, accompanied with the cash, to select the book they want, and send it to them at publishers' own price, free of other costs. Our arrangements are fully perfected, and we mean business! We shall continue our Catalogue of good books from time to time, adding the most desirable books published.

IMPORTANT TO SUBSCRIBERS.

We have made further arrangements so that we can offer PREMIUMS OF BOOKS for every prepaid subscription, to old and new subscribers alike; and to every person who solicits subscriptions we give extra premiums of his own choosing. Our premium rates are as follows: Upon each $1 50 subscription, prepaid for 1876, we credit to account of subscriber 50 cents reckoned in his favor upon an order for books to the amount of $2. In other words, after paying for 1876, upon receiving an order for any book or books at any time worth $2, only $1.50 in coin need be sent. The 50 cents added to the 50 cents to his credit, will pay for the books. Persons who, at the time of paying their subscriptions do not order books, or who order but a part of what they want at once, will be entitled to the benefits of OUR PREMIUMS AND REDUCTIONS whenever they choose to take advantage of it, at any time during the continuance of their Subscriptions.

TO SOLICITORS.

The agent sending us four subscriptions with $6 (the bare subscription price), will be entitled to $2 worth of books, his own choice, without further remittance. This gives every young man or woman a chance to get all the reading they want WITHOUT COST, and to the subscriber a chance to get books BELOW COST. We are sure that no better opportunity was ever offered to the public on this coast to obtain good reading. The AGRICULTURIST, greatly improved for 1876, will be worth more than the subscription price, which is within the reach of every one's means, and our arrangements of giving premiums is such as to be sure to please and satisfy everybody, whether young or old, rich or poor. We are determined that the AGRICULTURIST shall reach every home on the Pacific Slope, and while we propose to be liberal towards all of our subscribers, we hope to be favored by the efforts and good will of each and every reader of good books, and of the CALIFORNIA AGRICULTURIST.

If you ever intend buying a WIND MILL, examine the record of the solid-wheel ECLIPSE, tested 8 years; 3500 in operation—IMPROVED Hand or Windmill Force Pumps; Second-hand STEAM Machinery; CHEAP. Write me for circulars, or call. CHAS. P. HOAG, 118 Beale St., San Francisco.

AN ENTERPRISING FIRM.

Smith & Ryder, Jewelers, and dealers in Chickering Pianos and Esty Organs, have just fixed up, in splendid style, the fine store in McLaughlin & Ryland's Bank-building [lately vacated by Hart's dry goods store], and have moved their magnificent stock of goods from Wilcox Block to the new quarters. They are now right in the middle of the town, and will make such a display of Fine Jewelry, Watches, Sliver and Plated Tableware, etc., as will be sure to please their many friends and patrons.

Their Manufacturing and Repairing Department will not be neglected; will, in fact, be a feature of their business.

Since these gentlemen were flooded out of Marysville, and have made San Jose their home, they have not only made hosts of friends and built up a good business in spite of all competition, but, by their enterprise and liberality, have insured a success that warrants them in stepping square to the front.

If you want to be fairly dealt with, and get the best the world can produce at low prices, and no humbug about it, just give Smith & Ryder a call. Examine and price their goods; or, if you know what you want—a Watch, a Ring, a Tea-Set, a Piano, or an Organ—do dot fear to send them your order.

Remember the New Place, in McLaughlin & Ryland's Bank-building, First street, near the corner of Santa Clara street, San Jose.

Ho! For the Coming Harvest!!

Where to get the BEST

MOWERS & REAPERS

Is now the important question.

Examine these introduced by the

FARMERS' UNION.

THE LATEST IMPROVED

Two-Wheeled McCormick

AHEAD OF ANYTHING.

The cutter-bar of the Mower has the action of the Champion and the Buckeye, with Elasticity, Strength and Easy Control superior to all others. It is Powerful, Durable, Reliable; costs LESS than other first-class machines, lasts longer, and needs no repairing for years.

THE IMPROVED ADVANCE

COMBINED

Self-Raking Reaper and Mower

Has SEPARATE BARS for reaping and mowing —a truly Combined machine.

THE FAMERS' UNION

Has the agency for these machines in Santa Clara, San Benito, Santa Cruz, and Monterey Counties. Depots of Sale will be established in the towns of Gilroy, Hollister, Salinas, Watsonville, and Santa Cruz. Farmers will find it economy to see and examine these machines before buying others.

GENTEEL INTEMPERANCE.

A TALE OF OUR OWN TIMES.

BY NELL VAN.

"MAMMA," said Gertrude Dean to one of our staunch prohibitionist mothers, "can you imagine any evil that can consistently be called genteel?"

"Well, my dear, that depends upon circumstances," said the lady, with a puzzled look; "for instance, one might speak of a genteel dram shop with a degree of correctness to distinguish it from a low den where liquor is dealt out. Now a dram shop is in itself an unmitigated evil in any community—a plague-spot to contaminate the morals and pollute the very atmosphere to all within breathing distance. But, child, what prompted such an odd question? Of what were you thinking to suggest it?"

Gertrude frankly explained to her mother that, the afternoon previous, she and Fanny R. had sat next to a ministerial-looking gentleman, in a street car, who was conversing with a fine, benevolent-looking lady. "They spoke earnestly, mamma," said she, "and so loud that we became unintentional listeners and deeply interested in a remarkable story related by the lady. I can never forget the sorrowful expression of the old gentleman's face as he said, with a sigh, 'Alas! madam, it is but another example of genteel intemperance. We have plenty of such on every side, and it is the more lamentable because of our inability to prevent it.' He continued: 'the habitual drunkard can be dealt with by law, but this fashion of fostering drunkenness in the family circle, by offering hospitality with the wine cup, feeding invalids upon strengthening bitters and tonics, and drinking hot whisky punch to induce sleep, are all demoralizing in the extreme.' And, mamma, you should have seen the expression upon his countenance as he spoke—his hoary locks moving in the breeze and his eyes brightening with enthusiasm. I scarce ever saw a finer face, and both Fanny and I felt sorry to see them stop the car and go out, for we had been so much interested in them both."

It was now Mrs. Dean's turn to speak, and glad was she to remind her usually giddy daughter of the terrible evil which fashion had placed at our very doors to combat.

"On every side, my dear," said she, "we find men and women, and children even, either battling with or yielding to temptation in the wine-cup. Frequently the taste for liquor is inherited, and more frequently fostered by the habit of ignorant and unprincipled nurses feeding young babes either soothing syrup or gin-sling to keep them quiet. Upon the young women of to-day, my dear, rests a great responsibility—that of using your influence towards crushing out this hydra-headed monster. If more of our young girls were as firm in their convictions of right as my school-mate and friend, Amy Stanhope, much good might be accomplished. You've heard me speak of Amy, my dear. She passed through town a few years ago, with her husband, on their way to Japan, where he has been to establish a Christian mission. She was a girl of unusual power. Her youth had been spent where she had become familiar with the devastating results of intemperate habits, and upon every occasion she would read a lecture to the young men who hovered about her because of their fondness for wine. Young Oscar Metcalf was one of her chief admirers. He was the only son of a wealthy merchant who had spared no pains to give him a fine college education. At that time Oscar was a splendid-looking youth, generous to a fault, and the admiration of all the young women of the village when he spent his vacations at home, where he formed the acquaintance of Amy, who was spending a few weeks with his sisters. Like all the young men of the time, he had formed the very *respectable* habit of wine-drinking, and more than once had he remarked the sad expression and quivering lip of Amy while listening to his recitals of the lively times he and his college chums enjoyed together at the festive board. Occasionally a gentle remonstrance would fall from her lips, and she would tell him how disgusting the habits of smoking and drinking were to any right-minded young lady, that she pitied the one who became his wife, if he did not mend his ways, to all of which he replied in an off-hand way; but the truth of her arguments would rankle in his heart and destroy, for the time, his peace of mind, for he was madly in love with Amy, and desired to please her that he might win her for his own.

"In those days I was more thoughtless than she, and cared less for the future than for the glorious present. How well I remember taunting Amy with the remark that she would lose her lover with her reproachful talk, and that it was well enough for old folks and spinsters to preach temperance, but to one of her youth and good looks, she should take the world as she found it, for young folks would be young folks, and wine-drinking and smoking was a fashion among men which it was simply impossible to disturb. Such talk aroused Amy to use her influence upon me, and many interesting conversations we held together upon the subject, till I grew to love the girl for her strong principles and desire to influence all within her reach to do right, because it was right, regardless of fashion or custom.

"She afterwards made me a long visit, and I became conscious of the fact that she really loved the wild, harem-skarem Oscar, and desired above everything to save him from the ruin which seemed inevitable. She had won his affection and esteem and hoped to be able to shield him from the enemy.

"One evening we all stood on the moon-lit porch, where climbing vines filled the air with perfume. Her brother and mine, young Oscar, Amy and I had been talking over a grand party which we had all attended. Amy, as usual, deprecating the habit of the young men's frequent visits to the wine room, and, stamping her foot to give emphasis to her words, she said, decisively, 'I'll never marry a man who cannot find sufficient enjoyment in the society of his friends and the dance, without seeking outside stimulants.'

"'Tut, tut, little one,' said her brother, laughing; 'I dare say Oscar here will take wine at parties all the days of his life, notwithstanding his partiality for you—which he does not try to deny—and you never would try to coerce so clever a fellow as he is now, when he pays you the highest compliment a young man can pay a lady. Don't be too severe upon us young fellows with your strict ideas of propriety which belong to a past generation.'"

"And what did she say to that, mamma?" said Gertrude, with animation.

"Well," continued Mrs. Dean, "she turned upon him, with her large, brown eyes full of earnestness, and drawing herself up with indignation, she said, impressively, "George, I know a young lady—who shall be nameless, for she is very dear to your heart—who, to enhance the beauty of her complexion, is slowly poisoning herself with arsenic! She has not acquired the habit thoughtlessly for social indulgence, but to gratify a desire for the admiration of the world and the envy of a few of her own sex. Would you, in your sound senses, lead that young woman to the altar to become your wife, even though you loved each other to distraction, without attempting to awaken her to a sense of her danger and urging her to denounce the habit? Now, this wine-drinking, being a social habit, is much more disastrous in its results; for it does not necessarily kill its victim, but leads on to ruin no end to the number of participants. Henceforth, George, go your way, and let me go mine. Marry your transparent faced beauty and have her to bury; but I'll live the life of a spinster and deprecate the small vices of men to my dying day before I'll succumb and entail upon future generations a disgraceful inheritance.'

"Not a word was spoken in reply, and, Gertrude, those words sank deeply into the hearts of more than one of her hearers, as I afterwards learned."

"And did she marry Oscar, mamma?"

"No, child. He sat moody and uneasy the whole evening after we went in-doors, and before leaving had a long conversation with Amy, which made him renounce forever all claim to her hand.

"He found he must choose between the life he then led and a future with a new state of things. She year of trial she demanded before a final answer could be given was more than his weak nature could stand. They met for a time only as friends, and then as Amy was lost to him forever, he became reckless, and died as he had lived, a victim to what might be called "genteel intemperance." His passion for the cup was already stronger than his love for this pure girl. She had a lucky escape from a fate worse than any that can befall a noble woman—a sensual, selfish, drunken husband.

POOL-SELLERS AND AGRICULTURAL FAIRS.

Our Legislators will do one good work if they succeed in classing pool-selling as gambling, and subject it to the severest penalty of the law. We have had enough of it, and sufficient of its evil effects. Pool-selling is gambling—and pool-sellers are no better than any other class of gamblers. It is the most dangerous of all gambling; the most demoralizing, exciting, enticing, and therefore the most dangerous to the morals of a community. If pool-sellers are allowed to ply their avocations, why not license, or remove restraint from all other species of gambling? The power of pool-selling is felt all over the State, and wherever it is allowed. There are rings of pool-sellers who control State and county agricultural societies. They do not foster agriculture, or in the least benefit it; but agriculture is made to serve pool-selling, and whatever industrial interests are drawn together at fairs are controlled by the pool-sellers are a sort of breast-work and shield behind which they are sheltered. As a general thing, the presidents and directors of State and county agricultural societies are elected by the pool-sellers. Whom they oppose cannot be elected. The pool-sellers make up the boards, the speed programmes, the pool privileges. They match the horses so as to produce the largest sales of pools. They influence the boards to give twice as much for horse-racing as for all other exhibits. Pool-selling is chargeable with all the disgraceful conduct of drivers. They so manipulate the races as to rob the dupes who buy their pools and bet at races. They monopolize half the day at fairs, to the exclusion of all honest interests. We say, as we have heard dozens of honest farmers say, if all this horse-race gambling is to be forced upon us, and we cannot rid ourselves of it, let the fairs go down—the sooner the better. The public demand that pool-selling shall not be allowed at our State and county fairs. Pool-sellers have had control of fairs long enough. In place of our fairs fostering gambling, drunkenness, reckless profanity, extravagance and immorality, it is time that they be devoted to advancing material interests of honest producers, and fostering the virtues of our wives, sons and daughters.

Since 1854, the State has given the State Agricultural Society $118,000, and it has so managed, with all its vast patronage, as to be now some $16,000 in debt. The State Society is now praying to the Legislature for relief. Within the past three years the State board has given the horse, in purses and premiums, $52,592. For entrance to these purses they have, for the same, $21,071. Amount of all premiums paid for other purposes during the years 1873 and 1874 (excepting medals and diplomas), only $12,530. These figures, compiled from the transactions of the State Agricultural Society, will tend to show what interest is fostered by "State aid."

The pool-sellers take a percentage of

all money thrown into their game, the same as monte and faro banks do, the winner to pay the percentage to the game. Of the tens of thousands of dollars that go into pools over and over again during several weeks of horse-racing, how much, think you, is lodged in the game? What a convenience for these gamblers to be made respectable by law, and be subsidised by the State, and be allowed to virtually control the the fairs which are ostensibly held in the interests of agriculture and its kindred industries! How nice to be patronized by gaiety and beauty! How flattering must it be to a gambler's profession to be able to draw to its support the presence, and the dollars and dimes, of gentlemen and ladies, and boys and girls who walk in the highest strata of society!

In New York, Illinois and Wisconsin, we believe, pool-selling or other gambling is not allowed at agricultural fairs. In Canada no horse-racing is allowed within five miles of any place where a fair is being held, during the time of the fair. The testimony of our exchanges is all one way, that where there is no horse-racing there are better and more successful fairs. In Canada their agricultural fairs are probably the best supported by attendance of the people and by exhibitors of any fairs in America. Where the industrial interests alone are fostered, the fairs have better success financially than do fairs where horse-racing is fostered. And it requires no very deep reasoning to see that the grand results of fairs conducted to benefit industry must be vastly more profitable to the people.

We hope our legislators will favor the best interests of the people, and throw pool-selling where the gambling is deposited—on the criminal list.

We have never opposed the exhibition of horses. All of their desirable qualities should be shown—their strength, speed, action, stepping, walking, training, etc., to the best advantage. We believe that our fairs might be grand exhibitions of everything worthy included in the list of products of a civilized people. We much desire to see them become such, and hope our Legislators will subsidize no societies or fairs that include pool-selling, liquor-selling and other demoralizing practices in their exhibitions.

WIDE WAGON-TIRE BILL.

Santa Clara county has been provided with a law, by our present Legislature, to regulate the width of wagon-tires. This has been enacted to prevent loaded teams from cutting the roads to pieces. The expense of changing the felloes and tires of wheels will be considerable—a heavy tax upon many persons in the start, but the benefit in preserving roads will probably, eventually, pay, and when once established will be a good rule to follow.

Here is the act, in substance, as approved: All wagons used on public roads in this county, or wagons of any other county, used in this for habitual teaming, shall have tires as follows: If the axle in its vertical diameter be one and a half inches, the tire shall be two and a half inches wide; if one and three-fourths inches, three inches wide; if two inches, three and a half inches wide; if two and one-fourth inches, four inches wide; if two and a half inches, four and a half inches wide; if over two and a half inches, five inches wide. Or, if the axle be of wood, then the tire shall be as follows: For wagons constructed to carry one and a half tons burden, the tire shall be two and a half inches wide; if to carry two tons, the tire shall be three inches wide; if two and a half tons, three and one fourth inches wide; if three tons, three and a half inches wide; if four tons, four and a half inches, and all over five tons the tire must be five inches wide. This act takes effect after the first of May, 1878.

EDITORIAL NOTES.

E. M. Bishop & Co., who have lately gotten up a fine directory of San Francisco, are at work vigorously on one for San Jose. We judge by the pains they are taking that it will be a most complete affair, and a really reliable guide.

The Archer Railroad Bill was calculated to regulate the price of fares and freights on railroads in an equitable manner, allowing ample compensation to railroad companies. The Assembly passed it—the Senate Committee reported adversely. If this means defeat, it also means that *the railroads own the people.*

Retrograding.—The State Legislature has repealed the laws providing for the schooling every child, called the compulsory education law; also, the law allowing women to hold public educational offices. Either there is something radically wrong in our system of law-making, or else in the law makers themselves. At any rate, whoever looks for acts superior to the mental and moral calibre of our representatives will evidently be disappointed all the time.

Several fine contributions are held over for our next issue, and some departments are left out for want of room this month.

Premiums.—Any subscriber who has ordered books or chromos from this office, and has not received the same, will confer a favor by at once notifying the publishes that the matter may be attended to. Mistakes will sometimes occur. Letters and articles sent do not always reach the proper destination. It will cost only one cent to drop us a card. We design that every one shall get what he is entitled to without fail.

The local rain fall for the season, up to the middle of March is 19.8 inches. This is the exact measurement kept by Mr. Ethell at the San Jose Bank building. After the most stormy winter ever known on this coast, the weather cleared up on the 13th ult. with a fair promise of fine weather. But, as the longer we live here the less we know about what will follow, we will not venture to prophesy.

A Sample.—Those Legislators who advocate the bill compelling publishers of newspapers, etc., to append the name of the writer to each article published, are probably very wise and efficient representatives, in their own estimation; but if the exact estimate in which they are held by their constituents generally could, by any possible means, be comprehended by their immense intellects, they would have reason to "bag their heads."

(Signed),
S. HARRIS HERRING.

The visit of Dr. Mary E. Walker to this coast, and her lectures to the people, have made for her many warm friends amongst the better classes. She ventured to give expression to many wholesome truths, which were obnoxious only to such as were viciously inclined. In defense of honest marriage, of virtue and morality she uttered noble and feeling sentiments; while the way she handled libertinism, free-loveism, and the bad generally, was a caution to youthful looseness and gray-headed reprobates. The doctor's talks are calculated to make whoever hears them, hold purity in a higher estimation and despare wickedness with a deeper contempt.

McCall's Road Grader is certainly a very superior implement. It is so constructed as to be completely under the control of the manager, upon side-hill or level ground, in heavy or light work. The wheels are set on crooked axles that can be turned to any degree of pressure against the furrow-lifter, with a lever and coupling ratchet. It will work right or left with equal facility, and at any angle to suit light or heavy, hard or soft ground. The scraper is swung to a turn-table resting upon the running gear, the whole weight of which can be thrown upon it at will. A neater, or more admirably constructed device adapted to its work, it is hard to imagine.

There are three of these McCall graders now at work upon the Mount Hamilton road, doing each the work of over fifty men with ordinary scrapers. By the way, the construction of the Mount Hamilton road is being pushed with vigor, nearly all the men employed being white men—not Chinamen. This we are glad to notice, as there are hundreds of our own race who really need the work, and to send to China for a road which can be made at home would not be true economy.

Sheep and Goats.

ANGORA PROFITS—A FEW FIGURES ABOUT MOHAIR.

It has been asserted by some outside parties that there was no profit in Angora goats' fleece—that sheep's wool will pay much better than mohair. Until lately the owners of Angoras have not been able to fully refute the charges, owing to the fact that the low grades, brought from common goats, would not prove anything. Now that there are many high, and more pure-bred Angora goats than formerly, facts and figures are abundant to show that there is profit in breeding for the mohair.

We can present figures from three different breeders: Mr. C. P. Bailey, of San Jose; Stockton & Buffin, of Hornitas, and Mr. Gilmore, of El Dorado. Mr. Bailey weighed several of his best pure-bred fleeces, which ran as follows: Buck Romeo 2d, five years old, eleven months' growth of fleece, 8½ lbs; a two-year-old buck, one year's fleece, 7½ lbs; ewe, Scotch Woman, six years old, twelve months' fleece, 6½ lbs; ewe, Queen of Monterey, three years old, twelve months' fleece, 6 lbs; ewe, two years old, 5¼ lbs. The above fleeces are worth $1 per lb, net. From a flock of 1,000 young goats, one and two years old, were sheared 1,600 pounds. These were grades from 7-8ths to 31-32ds, and the fleece will average worth 60 cents per pound. Mr. Bailey says that he can get as good results from 31-32ds and 63-64ths as from pure-breds. Soon there will be many such, as the high-breds are increasing wonderfully fast now.

From a private letter written to Mr. C. P. Bailey, of San Jose, we are permitted to take the following facts and figures of Messrs. Stockton & Buffum's flock: They commenced grading up from the common goat and grade bucks, 15-16ths and 31-33ds, in the year 1864. The bucks were purchased in Ohio and driven across the plains by Thomas Brock, from whom they obtained their stock. These and similar grades were used a few years, when they obtained pure-breds, and have used nothing but pure-breeds since. Owing to a limited range, they have but a small flock. They have readily sold their surplus stock for fair prices, always carefully selecting and keeping the best goats for breedess. Their flock now consists of 550 head, of this number 36 are pure-breeds and the balance grades from 7-8ths to 127-128ths. Last year they shipped 1,500 pounds of mohair to New York (being the clip for two years) and sold it for 85 cents per pound, unassorted. They have a better clip this year, and expect a good price for it.

Messrs. Stockton & Buffum send figures of forty fleeces weighed separately. One pure-bred ewe sheared 7 lbs; one 31-32ds ewe's fleece weighed 7 lbs; a 15-16ths ewe sheared 6¼ lbs; a 7-8ths ewe sheared 4¼ lbs; five 7-8ths ewes sheared 18⅜ lbs; three 15-16ths sheared 17¼ lbs; two 31-32ds ewes sheared 13¾ lbs; four pure-bred ewes sheared 25¼ lbs. One of their pure-bred bucks sheared 7½ lbs, and a pure-bred buck kid 3⅛ lbs, while a grade kid sheared 4¼ lbs; twelve kids sheared 39 lbs of fine mohair; three pure-bred bucks sheared 20 lbs. But the most remarkable fleeces were the wethers'. One wether sheared 9¼ lbs! ten wethers sheared 76 lbs of fine mohair. We must make special mention of the produce of wethers. Evidently they will make the best mohair. The expenditure of vital

force incident to breeding, caring for, and nursing the young, detracts from the fleece production of breeding animals. The wethers keep in more uniform and better order on the same feed, and their fleece is not only fine and heavy, but uniform in texture during its growth the entire year.

About Stockton & Buffum's management, we learn that they drive their flocks to the mountains during the summer, where the animals have at once the advantage of a cooler atmosphere and greener feed, which conditions are favorable to fleece growing and the general growth of the goat. These gentlemen have this season sheared some 2,000 pounds, which is probably the largest shearing ever made in our State by any one breeder in a single season.

The Gilmore Angora Goat Breeding Association has made a report, and gave weights of best fleeces 6½ pounds ranging to 4 pounds. The entire fleece, we understand, was about 1,600 pounds, from some 2,000 goats. Of course, many low grades did not shear much, if any, mohair. This association claims, we believe, some 4,000 acres of land near Shingle Springs, and about 10,000 acres near lake Tahoe. The association also claims to represent some $350,000 in capital. Also, that it designs bringing to this State a large flock of pure-breds from Asia, soon. The breeders of goats in the State are anxiously awaiting the advent of this fresh supply.

The San Francisco *Chronicle* says: "Little pure mohair has been marketed as yet, because it is too costly an undertaking to import both bucks and ewes with which to stock the State, but the more expedient and slow method has been adopted of crossing pure bucks upon our native ewes. These half-breeds in turn will be bred to imported bucks, and as these animals breed so often, it will only be a few years at most until we shall have a stock of high-grades which will be so near thoroughbred that the difference cannot be distinguished, and producing a quality of mohair equal to that of the pure-blood animals. In a few years there will be goats enough in this State and in Oregon and Nevada to justify the building of a factory on this coast to work up the mohair, and when that event happens there will be profit in the business."

L. H. Gaskill writes from Campo, San Diego county, to the *Rural Press* as follows:

"I have been the Angora goat business only two years, and I think that it will not be long before it will supersede the sheep business, for several reasons. The goats do not need as fine quality of food as sheep. They will live entirely in the mountains, subsisting upon the browse of this lower county. I have a band of 600 and they range in the mountains all the time. I was afraid that they would pull out their wool, but they are as careful about that as a person would be about pulling his hair. The mohair I have worked right at home, the women work it the same as wool, into yarn, and knit it into socks and stockings. It is the old-fashioned style, but a very economical way of putting in long evenings. They work it by hand. It would be much better if there was some machinery for carding and spinning it into yarn; then they could afford to knit it very well and make it profitable to the manufacturer and the consumer. These socks sell from seventy-five cents to one dollar a pair, when you can get sheep'e wool for three to four bits for a pair made in the same way. One pair of mohair socks will last as long as four pairs of wool. They are more elastic, and the fiber is so long that the yarn is as strong as hemp twine, and very soft and white. I hope to hear from some other experimenters with the mohair."

In previous articles, we have written up other advantages and profits of this industry. There is no doubt in our mind that the Angora goat will yet be admitted to be the most profitable fleece-producing animal, and will discount the best breeds of sheep.

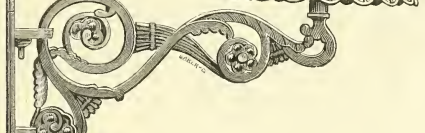
Poetry.

The Farmer.

Of all pursuits by men invented
The plowman is the best contented,
His calling's good, his profit high,
And on his labors all rely.
Industrious plans by him are laid;
Mechanics all by him are fed:
His hand gives meat to everythin,
Up from the beggar to the king.

The milk and honey, corn and wheat,
Are by his labors made comple;
Our clothes from him doth first arise,
To deck the lofty or dress the wise.
We, then, by vote, may justly stats
The plowman ranks among the great;
More independent than they all
That dwell upon this earthly ball.

All hail ye farmers, young and old,
Push on your plow and courage bold;
Your wealth arises through the clod,
Your independence from your God.
Hi, then, the plow supports the nation,
And men of rank in every station,
Let kings to farmers make a bow,
And every man procure a plow.



ORNAMENTAL WINDOW FLOWER BRACKET.

William Brown, of Oregon.

AFTER JOAQUIN MILLER.

They call him Bill, the hired man,
And she they call her Mary Jane;
And lovers often drew a rein
To chat and sigh as lovers can
Across the gate in snatch and catch;
And women winked across their tea,
And said, and truly so thought he,
That she would make a splendid match.

The hired man had loved her long,
Had loved her best and first and last;
Her very garments as she passed
For him had symphony and song.
So when one day, with brow arown,
She called him Bill, he raised his head,
He caught her eye, then faltering said:
"I love you, and my name is Brown."

She fairly waltzed with rage; she wept;
You would have thought the house a-fire;
She told her sire, the portly squire,
Then smelt her smelling salts and slept.
Poor William did what could be done—
He swung a pistol on each hip,
He gathered up a great ox-whip
And drove towards the setting sun.

He crossed the great backbone of earth;
He saw the snowy mountains rolled
Like mighty billows, saw the gold
Of awful sunsets, saw the birth
Of sudden dawn upon the plain,
And every eve found William Brown
Eat pork and beans, and then lie down
And dream sweet dreams of Mary Jane.

* * * * * * *

The teeter board of life goes up,
The teeter board of life goes down;
The sweetest face must learn to frown;
The biggest dog has been a pup.
Her lovers passed. Wolves hunt in packs.
They sought for bigger game. Somehow
They seemed to sea about her brow
The forky sign of turkey tracks.

At last she nursed a new desire;
She sighed, she wept for William Brown,
She watched the splendid sun go down
Like some great sailing ship a-fire;
Then rose and checked her trunks right on,
And in the cars she lunched and lunched,
And had her ticket punched and punched,
Until she came to Oregon.

She wore blue specks upon her nose,
She reached the limit of the lines,
And then set out to reach the mines,
In rather short and manly clothes;
Her right hand held a parasol,
Her pocket held a testament,
And thus equipped right on she went—
Went waterproof and waterfall.

She asked a miner gazing down,
Slow stirring something with a spoon,
To tell her true and tell her soon
What had become of William Brown.
He looked askance beneath her specs,
Then stirred his cocktail round and round,
Then raised his head and sighed profound,
And said, "He's handed in his checks."

Then cars fed on her damaged cheek,
And she grew faint, did Mary Jane,
And smelt her smelling salts in vain.
Yet wandered on wayworn and weak,
Until at last she set her down
Upon a sloping hill alone;
And there, good gracious! stood a stone,
And lo! that stone read—William Brown.

"O William Brown! O William Brown!
And here you rest at last," she said,
"With this lone stone above your head,
And forty miles from any town.
I will plant cypress trees, I will,
And I will build a fence around,
And I will fertilize the ground
With tears enough to run a mill."

She went and got a hired man,
She brought him forty miles from town;
Then in the tall grass she sat down,
And bade him build as she should plan.
But Digger herders, with their bands,
They saw and hurriedly they ran
And told a bearded cattle-man
That some one builded on his lands.

He took a rifle from the rack,
He girt him in his battle-belt,
He thrust two pistols in his belt,
Then mounted on his charger's back,
And plunged ahead. But when they showed
A woman there, about his eyes
He pulled his hat, and he like-wise
Pulled at his beard, and chewed and chewed.

At last he got him down and spake:
"O, lady, dear, what do you here?"
"I build a tomb for my own dear,
I plant some flowers for his sake."
The bearded man threw his two hands
Above his head, then brought them down,
And cried, "O, I am William Brown,
And this the corner of my lands."

Her specks fell off, her head fell back,
Some like a lifted teapot lid;
She screamed—this ancient maiden did—
Then, fainting, split herself, slack!
Right in the heart of William Brown.
Then all the Diggers were amazed.
They thought the lonely maiden crazed,
And circling there, they squatted down.

* * * * * * *

The preacher rode a spotted mare;
He galloped forty miles or more;
He vowed he never had before
Seen bride or bridegroom half so fair.
And all the miners, they came down,
And feasted as the night advanced,
And all the Diggers drank and danced,
And cried, "Big Injin, Willirm Brown."

Up to the date of our going to press, the season is remarkably promising for a large fruit crop, as well as for grain, hay and vegetation generally. If we have no heavy, late frosts, all is well.

City Gardening.

Spring Flowers.

Oh! dainty baby foresters,
That hide in silent nooks,
That linger by the cow-paths,
And peep into the brooks,
To me you are the warders
Of the realm of Long Ago,
At whose soft beck unnumbered forms
Like shadows come and go.

By mossy rocks and nodding ferns
You lift your timid eyes,
And by the wounded maple tree
In smiling groups arise.
No more the shrieking winter winds
Affright the naked woods,
But all the scented aisles are gay
With Flora's dappled hoods.

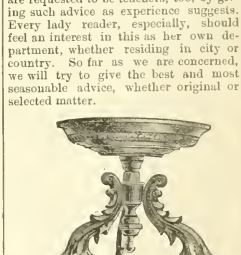
Though years have sped since first for me
You made the meadows bright,
And many a sunset-tinted dream
Has faded into night,
Still do I hail with boyish love
The violets' sweet perfume—
Still joy to see the crocus burst
Like Lazarus from the tomb.

I thrill to see the buds again
Upon the apple tree,
Where every branch is eloquent
Of glories yet to be;
Where soon the winged Argonauts,
From lands beyond the main,
Will sing their merry love-songs,
And build their homes again.

Trace the tints of deathless Hope,
Sweet flowers, in all your beauty;
You come as meek interpreters
Of man's exalted duty.
You whisper of a dawning heaven
Beneath us as above,
When earth shall melt with poetry,
And man be full of love.

CULTIVATING FLOWERS.

THERE is so much that needs to be said, and that should be said, under this department, that we are almost puzzled where to begin or leave off. But as we cannot get it all into one paper, and as it is necessary, to be a successful gardener, that one should learn well what he or she does learn, it may be well to give short lessons, and request each reader to commit to memory and to practice, each month, as much of it as possible. We can all be pupils, and all are requested to be teachers, too, by giving such advice as experience suggests. Every lady reader, especially, should feel an interest in this as her own department, whether residing in city or country. So far as we are concerned, we will try to give the best and most seasonable advice, whether original or selected matter.



HOW TO DESTRY PLANT LICE.

A lady subscriber near Virvinia City wants to know how to destroy lice *(aphids)* on house plants. It can be done by fumigating with tobacco smoke, also by dusting fine snuff upon them. To fumigate, place your plants in a small room, or into a large dry goods box where they can be closed from outside air; then upon live coals, or a hot stove cover, drop pulverized tobacco, and close the entrance for several minutes. The

smoke will kill the insects without injuring the plants unless they are exposed to the fumes over fifteen minutes. Hot water will kill insects. A single, quick plunge into, or pouring of hot water upon plants, will kill all aphids without killing the plants. The insects get under as well as upon the leaves, and must be reached, whatever the means used to destroy them. A drop of carbolic acid in a wine glass of water will kill aphids if put upon them.

These lice are hatched from eggs that a small fly, the size of a gnat, with long wings, lays upon the plants. Once killing of them may not last forever, as more eggs may be laid and another crop soon grow. But keep at them. They are mortal, and will succumb to persistent treatment, generation after generation.

Illustrations.—We present a picture of an ornamental, hinged, metalic window bracket, and also another of an elegant single flower-pot stand, to set upon a shelf or table. These convenient and beautiful articles we see for sale at Mr. T. W. Mitchell's floral depot, in San Jose, who sells a variety of ornamental flower furniture at low prices. They will also suggest to the reader rustic work that can be constructed at home, out of such materials as can be obtained in the vicinity of most homes. A thousand things can be made to beautify the home, by the exercise of a little ingenuity.

Window Gardening.—It may be beyond the reach of a good many to possess a greenhouse, says an experenced gardener, but there is no one but may have a few plants in the window. The culture of plants has a weighty moral influence upon those who indulge in it for the love of it. In fact, a study of nature in any of her varied forms leads the mind away from that which is ignoble to that which ennobles it. Especially is this the case with the young, and it should be the aim of every head of a household to bring the younger members under the influence of whatever teaches morality, and helps to direct the intellectual abilities in a legitimate channel. A study of nature, therefore, as she exhibits herself in the floral world, is within the reach of nearly all; and every one possessing the convenience should endeavor to cultivate a few plants for the sake of amusement, as well as to help make home attractive for the younger members of the household

That the plants be in good healthy condition, is really more needful with regard to what is required for the window than for the greenhouse. In the window, although the atmosphere is suitable for plants to continue to flower and keep in health, if in good health when put in, yet it is difficult to revive into luxuriant health when sickness has ruined the constitution. In the genial atmosphere of the greenhouse, a sick plant *may* be brought into good health again. Therefore, for the house, get small but healthy plants. Large plants soon fill the space allotted for them, and have not room for freedom of growth, and look miserable. Small ones, in healthy condition, give the owner considerable pleasure in seeing them grow, and also do best. Large plants cannot be grown very satisfactorily where they get insufficient light, and enough cannot be given them when hampered in a small place. A window with a southern or eastern aspect is considered the most suitable. Keeping the glass in the window clean has often a good effect on the plants. In hot, sunny days in summer, a thin muslin between the sun and plants will prevent scorching and drying of foliage. Careful washing of the leaves cleans off all dust which may accumulate upon them.

When it is necessary to repot plants, do so with care. Destroy the roots as little as possible; after placing the drainage, then as much soil as will raise the base of the plant so high that about an inch will be left from the surface of the roots to the rim of the pot. Use a narrow strip of wood to press the soil between the roots and the side of the pot, taking care that no empty spaces are left around the roots, especially if it is a hard wooded plant. If empty spaces are left when potting it is very difficult to tell when the plant is dry, as it has always an empty and dry sound even when saturated with water. When pots are kept in saucers in windows, do not allow much, if any, water to remain in them long after watering the plant. Never water the plant by putting the water into the saucers, but water always at the surface of the pot, and allow it to drain through the roots, which is the far superior and more natural way. Plants allowed to remain in stagnant water get so saturated that their health is soon destroyed.

Testing Seeds.—All seeds should be tested before planting, especially all small seeds, which can be done in simple ways. One way is to take a saucer and fill it with white sand, and then fill it with enough water to wet the sand and keep it so, place the seed on the wet sand pressing it gently into it so that the seed is about half way imbedded into the sand and set the saucer in a light, warm room, in the sunlight.

Another plan is to take two thicknesses of woolen cloth—either flannel or fulled cloth will answer. Dampen them with water, and lay them in some shallow dish, as a plate or saucer. Then sprinkle a few seeds on them, being careful not to spread the seeds so thick that one will lay upon the other. Now dampen another piece of cloth and lay over the seeds. Keep the plate or saucer in a moderate warm place, and by removing the upper cloth at will you can watch the result. The good seed will gradually swell and finally sprout, while the seed that is too old, or that is bad from any other cause, may swell at first, but, instead of growing like the good will mold and rot.

Still another way: Take a wide-mouthed, clear glass bottle nearly full of clear water, and take lint cotton and mix the seed through it and lay the cotton, after being moistened, on the water. This plan has the advantage of keeping the seed in a uniform moisture until it germinates. The bottle should be placed in a light room, where the sun can reach it. Seeds will germinate in from 24 hours to 10 days, governed by the kind, size and age of the seed and the warmth of the room. The seed being exposed to view can be watched as their daily progress, which will furnish a very interesting study to both old and young.

Planting Seeds.—If seeds are planted too deep, they either rot in the damp, cold earth, for the want of warmth necessary to their germination, or after germination, perish before the tender shoots can reach the sun and air; and thus that which was designed for their nourishment proves their grave. Sand, sawdust, vegetable mould or some light material should be used to cover seeds. Then the soil should be kept gently and regularly moist until they are well started.

Warmth and moisture are necessary to the germination of seeds. Neither of these will do alone. Seeds may be kept in a warm, dry room, in dry sand or earth, and they will not grow. They may be placed in damp earth, and kept in a low temperature, and they will most likely rot, though some seeds will remain dormant a long time under these circumstances. But place them in moist, warm earth, and they will commence growth at once,

After seeds are nicely started, the plants three inches high may be transplanted with a trowel, with the earth about the roots.

Roof Gardening. — Roof gardening has, in Chicago, one very admirable illustration in the case of a hotel. On the roof of the first story is a court, opening outward to the south. Above this, on three sides, in a circular style, run three more stories. This court or roof is simply a garden. The tiles are set over with vases, and these during summer are filled with gorgeous bloom. A hundred windows look out upon this loveliness, and from the second floor persons can walk out for a pleasant promenade. The designer and owner, Mr. Phinney, tells me the thought came to him while on shipboard crossing the Atlantic, and he hastened to put it into form. Of course the whole establishment becomes a family. The ordinary hotel barrenness is an impossibility. A gorgeous display of gilt and fresco is displaced by nature's adornment. That kind of refinement arises which can come only from a fusion of city and country life. Cottage hotels in the smaller cities, such as the Dwight house on the old Dickinson place at Binghampton, surrounded with parks, fountains and flowers, are an easier possibility. Indeed it seems strange that they are not more general; but here is a garden home, for the first time in America, embedded for the public in the heart of a vast city.—*E. P. P., in Gardeners' Monthly.*

Window Plants.—A writer for the *Scientific Farmer*, who professes to know all about it, says that according to the temperature required for the healthy growth of different plants, they may be divided into two classes, namely: Those that grow well at an average temperature of 50 degrees, that is, ranging from 40 to 60 degrees, and these that require a higher temperature, an average of 60 degrees, ranging from 50 to 70 degrees.

The first class will include geraniums, carnations, centaureas, camellias, azaleas, abutilons, ageratums, callas, sweet alyssum, English ivies, smilax, mignonette, hyacinths, palmudas, stevias, petunias, verbenas, lobelias, and roses. In the second class are begonias, bouvardias, epiphyllums, cacti, fuchsias, gloxinias, German ivies, heliotrope, pileas, zorrenias, and roses. Roses are included in both lists, as they will succeed under either conditions.

Plants grow much better where the temperature runs lower at night than during the day. It never should go below 40 degrees in the first case, or below 50 degrees in the second case.

Look to Your Axles. — How many horses suffer by the want of attention to the axles of carts and wagons. We often see the wheels running at an angle ten or fifteen degrees "out of true," the teamster seeming not to realize how much this increases the burden. If the wheel will only revolve, it seems all that is needed by the thoughtless driver. Then, again, want of care in greasing the wheels is another source of unnecessary labor for the horses. It is only fair, that while we require reasonable labor from our animals, we shall grant them reasonable facilities for doing it.

A YOUNG MAN ASKS ABOUT THE STOCK BUSINESS.

New York, Feb. 11, 1876.

Ed. Agriculturist and Live Stock Journal: *Dear Sir*—I hope you will pardon the liberty I take in addressing you, but I desire some information and do not know who else to apply to.

Having a desire to go to Southern California and engage in stock raising, I wish to know what chance there is for a strong, healthy young man. I would like to engage myself to some large stock grower, learn the business thoroughly, and, as soon as possible, start in business for myself. Can you give me any necessary information?

Very truly, yours,
Horace M. King.

Remarks: As Mr. K. has not intimated what kind of stock raising he wishes to engage in, we hardly know what answer to make. The old way of cattle-breeding on a thousand hills—wild stock with wild vaqueros to herd them over hundreds of leagues of land, is drawing to a close. As the country gets settled up, a more civilized and better system is being adopted. There is abundant room for introducing the better breeds of all kinds of stock. It will require some money to get land, and time to accomplish much, but there is no surer business if properly conducted. But do not entertain an idea that your services will be valued by such men as adhere to the old style of cattle and sheep husbandry. All they want is a wide, free range, and Mexican herdsmen mounted upon bronco mustangs—a half-civilized condition and business. We request such of our readers as may know of any opening, or as can give information or encouragement, to write to Mr. King.

BENTLEY'S HOT-AIR FURNACE FOR DRYING FRUIT.

Dr. G. J. Bentley, of Michigan City, Ind., who has been spending the winter in Santa Clara, has shown us a device for producing hot air for drying purposes that seems to be constructed on rational principles and is so simple as to commend it as worthy of attention. To us it appears to be just about the thing, whether hot air is required upon a large scale, or is wanted in ever so small quantities, as the furnace can be made of any size, and do equally good work according to its capacity. Of course, an economical dryer must utilize as much of the heat of the fuel as possible. Dr. Bentley's furnace is so constructed as to waste the least possible amount of heat. He proposes to construct three sizes, worth respectively $50, $75 and $100, capable of drying 10, 20 and 30 bushels of fruit at a time. The rooms and apparatus for drying can be made at the option of the parties using the dryers. The smaller sized need not cost over $25, screens and all complete. This would make a dryer and furnace, suitable for any ordinary orchard, cost only $75.

The dryer is also an excellent heater for dwellings—better than any stove or fireplace. It is already in use in public and private building in various places.

One of these can be seen in operation at Mr. Menzell's hardware store, Santa Clara, and also a model of the furnace. Next month we will give a description of this furnace, as we believe it must prove of great advantage, and is the very thing that our orchardists need.

Truth and honesty often neglect appearances, hypocrisy and imposture are guarded.

Stock Breeder.

Two Kinds of Cattle Husbandry.

THE Colorado *Farmer and Live Stock Journal* exactly expresses our sentiments upon this question:

A citizen of New Mexico owns not less than forty-two townships of land, and has it stocked with sixty thousand head of cattle. In Texas there are cattle ranches nearly as large, the number of cattle ranging from twenty to fifty thousand head. In early times ranches stocked with twenty or thirty thousand cattle were not uncommon in California.

There was an attractive side to this primitive cattle husbandry. It was a grand thing to send forward great herds of cattle to market, or to ride over a domain as large as a whole county. But this kind of cattle husbandry involved no improvements. No crops were raised, roads built or fences made. In short, cattle raising as followed in New Mexico and Texas, or as formerly in California, tends to barbarism. The business develops nothing that is best for the individual; it stimulates no growth, encourages no agricultural improvements, organizes no society, supports no school, and does nothing for a well-ordered community.

There are few who sigh for the good old times when if a hungry man wanted a beef he took it from the fields, or if his horse gave out he exchanged it for a fresh one with the next ranch man. No doubt the rude hospitality of these early times was attractive. But then an ox was worth little more than his hide would bring, and a horse had no commercial value. The "pastoral days" have departed, and they are succeeded by much better ones.

The new cattle husbandry involves the best improvements. When a farmer undertakes to raise the best breeds of cattle his enterprise is sure to carry him far enough to adopt the best methods of culture. The home-farm is put under conditions of renewal. It is conveniently sub-divided, the exterior fences are well-built, and the problem is, how many cattle can be sustained on a given number of acres. These high bred cattle will pay for all the care bestowed upon them. They want rich pasture and a small area.

The sheep and cattle husbandry which have become accessories of the home farm have an influence just the reverse of primitive cattle husbandry. The latter was continually lapsing and carrying everything towards barbarism; the other involves skill, stimulates the best methods of agriculture, and lifts up farming to an intelligent and attractive home pursuit. The great ranges of New Mexico and Texas may serve a useful purpose in furnishing beef for populous cities, but even then it is not the best. The business will disappear before the advancing wave of population, because the very conditions of success are immense ranges and an absence of population.

Best Varieties of Peas.—Early sorts—Daniel O'Rourke, Carter's First Crop, Bishop's Long Pod. Late sorts—Champion of England, Blue Imperial, Veitch's Perfection and several varieties of Marrowfats.

Mammoth, overgrown steers have had their day, and we now come down to the neat, compact, well-fattened animal, both in hogs and cattle. To accomplished this in cattle, good feeding from a calf is necessary."

THE GREAT ANNUAL SALE OF FINE STOCK.

From Hon. Cyrus Jones, President of the Short-horn Breeders' Association of California, we have received a catalogue of the "Great Sale of Thoroughbred Short-Horn Cattle, to be Sold at Public Auction at the Fair Ground in Sacramento, on Thursday, April 20th, 1876." This is the first spring sale, and it will be conducted under the auspices of the association above mentioned.

The association first undertook to conduct the annual sales in the fall, during the State and county fairs, but found that, as the fall was not the season that stock-raisers cared to purchase breeding stock, they had better change the time to the spring, when every intelligent breeder is looking for animals to improve his herds.

We expect that there will be a rush of competitors to this grand sale of fine stock. There will be no horse-racing, or crowd of sight-seers as at the fair times, to divert attention from the sales. Whoever attends will be likely to mean business. The way such sales are attended in the great Short-horn districts east of the Mississippi should be a fit example for the cattle breeders and owners on this coast. There is no place under the sun where fine stock is more needed than in California, to grade up our bands of cattle and improve the general farm stock. There is every reason why our stock men should be awake.

The Short-horn Breeders' Association of California is composed of the best breeders of fine stock, and they represent some of the finest Short-horns in America. Several of the principal breeders will put up some of their best, and an opportunity will be offered to buy that no enterprising owner of cattle can afford to lose. Such breeders of thoroughbreds as Cyrus Jones & Co., Col. Younger and Wm. Quinn of San Jose, W. T. Overhiser of Stockton, John Brewster of Galt, Moses Wick of Oroville, J. D. Carr of Gibilian, M. B. Bourgis of Centerville, and E. Comstock of Sacramento, will put up several head each. We notice pedigrees of twenty-nine bulls and several cows and heifers, and are assured that several head of thoroughbreds not catalogued will also be sold. Besides, there are a number of fine grade Durham cattle to be sold, also Berkshire swine and fine sheep.

We expect the time is not far distant when much importance will be attached to the annual spring sales. They only need a little popularity to draw all the cattle men and fine stock men on the coast. But, really, now is the most important time, for the sooner such stock is obtained by our beef and butter producers, the better for them and their stock. As a purely business proposition there is no better investment for a breeder than *pure blood*.

Camels.—The breeding of camels was begun in Texas, twenty years ago, by an importation of the War Department. From Texas the camels were taken to Carson valley, Nevada. The first importation were India camels; the second were the two-humped camels of China. These two varieties cross well together. The two-humped are preferable, as they are more docile and kind to handle than the one-humped.

The breeding of the camels has been a success, and, as pack animals, has been profitable. They subsist on the sage brush and less desirable herbage of this rugged, barren region, and attain such size as is unknown in any other country. They were the largest we ever saw, and were selected with reference to shipping in the cars. The largest ones could not be put into the ordinary stock cars used on the Pacific railroad. The man who owns and breeds them is a Swiss, and wants to sell out and return to his native land. If he does not, he intends to remove to Arizona with them, for the reason that camels as pack animals frighten the teams of "freighters" and make trouble for him continually. They breed once in two years; and in this lot there was one cow camel with her year old calf at her side, taking his dinner like any other great, saucy calf. The most of these were two and three years old. The five-year-olds were, as stated, small-ish selections from this herd, yet their hums were very near the roof of the car, and their odd-looking heads had to be kept in a very cramped position.

It is a matter of wonder and congratulation that the breeding of superior camels is added to the live stock interests of the country. From this camel-breeding establishment can be supplied all the show animals needed for the world, as they cost no more to rear than mules, and are far better as pack animals. The rigors of winter, and the heat of summer, are alike favorable to their growth and prosperity. Nevada, though, is a fine stock growing region for cattle, horses or sheep, as well.—*Live Stock Journal*.

Sale of Short-Horns During the Past Year.—Says the *Pall Mall Gazette*: Short-horn sales are becoming almost as sensational as those of thoroughbred yearlings were a short time since, and it is no uncommon thing for an animal of the Bates or Booth blood, each of which strains has its respective admirers and even champions, to be sold for a price equal to that which a Derby winner would have realized a few years ago. From comparative tables of the results of those sales during the past year in Great Britain and America, which are published in the almanac of the *Agricultural Gazette*, it appears that the total amounts realized at these sales were almost the same for both countries. The returns refer only to the sales of "pedigree Short-horns"—that is to say, animals inscribed in the Herd Book, which is for cattle what the Stud Book is for the turf; and from them we learn that, while the sixty-five sales held in Great Britain yielded a total of £228,088 16s. 6d., the fifty-seven sales in America amounted to £204,790 6s. 10d. Each of the American sales amounted on an average to £3,593, as against £3,509 for each of the English sales; but the advantage does not in reality remain with American breeders, for though eight less sales were held there, the number of animals disposed of was within ten of those sold at home. The 2,589 Short-horns sold in America averaged £79 each and the 2,589 sold in Great Britain £87 each. The largest total realized at any one sale was £42,019 18s., for which 84 animals belonging to the late Mr. Torr, a Lincolnshire farmer, were disposed of in September. The highest price given at this sale was 2,160 gs., and the average for the whole lot was £510 19s. Still more remarkable was a sale held in Scotland a week previously, when 39 animals, the property of Lord Dunmore, brought £26,223 15s. This gives an average of £672 8s. for each animal, one of which went for 4,500 gs. At a third sale 34 animals brought more than £10,000, and several others took place at which the total was over £7,000 and the average over £200.

The most successful sale held in America was that at which 83 animals brought £18,534 15s. 5d., with an average of £402 19s. 9d. for the whole number, one of them reaching £3,225. At two other sales in America totals of rather more than £10,000 were obtained for 35 and 33 lots, the average in the two cases being slightly over and under £300. These figures may be left to speak for themselves; but it is impossible to avoid the suspicion that purchasers will not in the long run get the best of the bargains.

The *London Court Journal* says the following about Short-horns:

Whether the top price for Short-horns has yet been reached we do not know, but that a Duchess bull was sold for 3,500 guineas is a "great fact." The animal was named the Duke of Connaught, the purchaser was Lord Fitzhardinge, and the price was paid at the sale of Lord Dunmore's castle at Dunmore, near Stilling. It is not surprising to learn that this animal was described as "the finest Duchess bull in the world," and it is satisfactory to know that he is not going out of England. Strange to say, both the sire and mother of the Duke of Connaught came from Canada, having been bred there by enterprising purchasers of Bates' stock. The other prices realized at Lord Dunmore's sale were higher on the average than ever before known. Another Duchess bull brought 3,000 gs., two magnificent cows, 1,950 gs. and 4,810 gs. respectively, and very few of the animals offered realized under £300. The average of the bulls was £992 16s. 8d. per head, and of the cows, £576 5s. 6d. per head, the total average of the sale of 39 lots being £672 16s. 8d. per head.

American Beef on the London Market.—An article in *The Farmer*, published in London, England, representing that forty-two tons of American beef had just been sold on that market for six pence per pound, was deemed of sufficient importance to telegraph to this country. The beef in question was the fourth consignment made by Eastman & Martin, well-known dealers of New York city. They claim to be the first experimenters in this direction, fitting up a line of steamers with refrigerators of the Bates patent, having a forced circulation of air. While the enterprise has proved successful in delivering the beef in good condition in the new Smithfield Market, it remains to be seen whether there is sufficient margin in values between New York and London to make it profitable. Shipping about the best beef found in this market, the first cost, with the subsequent expense of sending abroad—using about 40 tons of ice to each 100 head of cattle—so run up the bills that it is a question whether a successful competition can be carried on with the choice English and Irish beef sold at about 8 pence per pound. After landing in Liverpool the meat is run to London by car, and to prevent its getting dirty by handling, each quarter is bagged or wrapped in cotton, so that the care, labor, and expense are considerable items in the cost of delivery. Further experiments, with a view of economizing some of the expenses are being made, and the question will soon be settled.

The New York *Sun* says: The shipment of American beef from this country to England is an established business. The "Nevada," "Wyoming" and "Dakota," of the Williams & Guion line, have been supplied with refrigerators, and two others are being furnished in Liverpool. The refrigerators are 40 feet long, 28 feet wide, and 9 feet high. At one side is an ice-house, holding 40 tons. A blower, run by a steam engine, keeps a current of cold air from the ice box on the meat.

The Foot and Mouth Disease in Europe—a Remedy.—The foot and mouth disease continues to make its ravages

here; it is a malady more troublesome and annoying than dangerous; it is unpleasantly contagious, also, especially for pigs; it does not destroy the animals, but retards their development and production. The Veterinary College of Alfort recommends the isolation of the affected, and the free use of diluted carbolic acid in the sheds; to break the pustules with a rag-stopper, and garcle the mouth with a preparation of honeyed water sharpened with vinegar, alum, or brandy, several times a day; administering linseed or other meal drinks requiring only to be swallowed. When the feet are sore, the bedding ought to be very dry and clean, and the ulcers each touched with a mixture of alum and carbolic acid in 95 parts of water. If fever be declared along with diarrhea, half a pound of Glaugher salts is added to the drinks to cleanse the blood. Connected with the malady, is a plan of insurance in operation in Upper Savoy. The farmers of a townland form a society; each animal insured pays two francs, and an additional franc as an annual premium. In case of loss, the farmer receives the full price of the animal, provided he has followed the instructions for treating it when diseased. At Lille there is a society that will insure cattle against all risks; the premium being five per cent. on the estimated value of the animal; a single farm can insure as far as 300,000 francs.

Value of Improved Stock.—A writer in the New York *Times* put the question plainly in saying that if a farmer keeps thirty cows that average $30 a year each for milk, and he can increase the average to $40 a year by the use of a thoroughbred bull, of a good milding breed, he can afford to pay a good round sum for a bull. And yet better results than this have been accomplished. If he is raising cattle for beef, and he can add two hundred pounds to the carcass of each, by the time it is ready for the shambles, by the use of a Short-horn bull, it will certainly be profitable for him to pay a good price for such a bull. And yet this is the average result of using thoroughbred bulls on the native cows of the country, as estimated by all the best stock breeders. And this two hundred pounds is clear gain, for it is produced with no greater consumption of food. If the use of a thoroughbred ram on a flock of common ewes will increase the weight of fleece one pound, on the average, certainly more than "five in a hundred could make it pay;" whether more than one in five would or not, is another question. And so with hogs. The difference between the common "woods" breed of the past, and the improved breeds of to-day, is beyond comparison.

Guernsey Sale.—A herd of choice Guernsey cattle imported by the Massachusetts Society for promoting agriculture, over a year ago, were sold at auction at Jamaica Plain, on 3d of November. Twelve head were sold at prices ranging from $64 to $301, and the aggregate amount realized at the sales was $1,734.

Be kind to the young stock. Let the first thing it knows, after its parent, be the kind voice and gentle hand of its master. Accustom it to kindness as it grows up, and when it reaches maturity there will be no difficulty in teaching it to perform its duty.

What men want is not talent, it is purpose; in other words, not the power to achieve, but the will to labor.—*Bulwer.*

The Horse.

BREAKING COLTS.

WHETHER it is best to handle a colt while young, and accustom it to the bridle and obedience, or to wait until it becomes of age to be broken to work, is a question with many persons that will bear discussion. California farmers have, many of them, tried both methods, and we would be glad to getthe opinions of such as take an interest in the question. One thing should be considered: colts that are handled young are generally fooled with by boys, or in playful sport by men, and are likely to lose confidence in men, and to become persistently unruly. On the otherhand, if never handled, they have as much respect as fear of man, and, having no bad tricks, are more likely to become fully obedient as soon as they find it is required, and that it is easier and better for them to be observant and yield compliance than to resist their master. We have often thought upon this subject, and were reminded of it by reading the following from a working farmer in the *Rural New Yorker:*

An old saying is, "live and learn," and to-day my son taught me something I had forgotten. I set him to break a colt rising three years old, which, being by a fast trotting horse, has been saved entire. He had never been touched by any one, being as wild as any animal could be. My son, with a man to help, put on a head-stall, with a long rope attached, which they did in a stable after he had been separated from the company he had been running with all summer. He was then moved about until he discontinued hanging back, which he persisted in doing for nearly two hours, when, as his neck probably began to get tired of the strain and he found by sundry plunges that there was no getting away, he commenced to walk along quietly, and then a collar was first put on, and at intervals, as he cooled off and submitted to be handled all over, harness was put on, so that by dinner time he had drawn a log of wood three-quarters of a mile and back again. He was then put into the stable, when he ate the first quart of oats he ever had and also a little hay, after which old "John"—a steady, heavy, fine cart horse—was hitched into a stone boat with the colt by his side, and after one hour's hard walking around a paddock the two were put to a wagon, and they went a distance of two miles to some oat stacks which had been pulled by some steers having broken down the rails, and about half a load of loose oat straw was brought home, and his coltship seemed perfectly quiet and willing to move as guided, so that, instead of waiting to go day by day in training, it was done hour by hour, and judging from his lack of fear and apparent liking to be brushed and cleaned, it is probable he will do half a day's work to-morrow quite as tractably as if he had been in hand days instead of hours. I shall have him work about three days a week, so as to keep him growing and looking in good condition.

We worked a filly in the above manner last winter and turned her to grass in the spring. She is now doing regular work and is a very fine animal; but in that instance we took days to do what has been done since morning.

I recollect now that years since, when I farmed in England, that although it was a month's job to break a nag, there being regular colt breakers by profession who got them quiet to ride and with good mouths, yet the cart horse breed of colts had a more summary way of breaking than the one just related, for as horses are worked a good deal there three or four in length, one before the other, the colt was haltered and forcibly pushed to the horses, and two before and one behind started to work, with a man on each side to keep him straight, which, as the horses kept regularly walking on, was not a difficult job. Of course there would be a deal more trouble with some than with others; but after finding there was no escaping, most of the colts would soon become docile, and often there would be one which would walk away from the first and give no trouble, the men walking on each side leaving, so that the regular driver would be all required to mind him.

Again—The colt has worked half a day, going quietly and actually standing instead of a horse hauling corn stalks. Advocates for handling colts from the time they are weaned won't like to read of such dispatch.

Hereditary Disease in Horses.—Darwin sums up his researches upon this subject as follows:

Even if no single fact had been known with respect to the inheritance of disease and malformations by man, the evidence would have been complete in the case of the horse, as horses breed quicker than man, are matched with care and are highly valued. I have consulted many works, and the unanimity of belief by veterinarians of all nations, in the transmission of various morbid tendencies, is surprising. Authors who have had wide experience give in detail many singular cases, and assert that contracted feet, with the numerous contingent evils of ring bones, curbs, splints, spavin, founder and weakness of the front legs, broken and thick wind, melanosis, specific opthalmia, and blindness, (the great French veterinarian, Hugard, going so far as to say that a blind race could soon be formed) crib-biting, jibbing and ill temper—are all plainly hereditary. Youatt sums up by saying that "there is scarcely a malady to which the horse is subject that is not hereditary," and Mr. Hugard adds that the doctrine "that there is scarcely a disease that does not run in the stock," is gaining new advocates every day. I may add to these facts, established by such weight of concurrent testimony, what I have before marked in general, namely, that it is not the actual ailments, such as contracted feet, ring bones, curbs, splints, and spavin, but the predisposing causes that are transmitted. The disposition of parts, the imperfect shape and size, or the faulty texture of any tendon, bone or muscle most favorable to a particular disease, are transmitted from sire to son. The same may be said of those disorders which affect the internal organs or the whole body. The abnormal condition of the blood, and not the scrofulous symptoms it produces, is hereditary. The weakness in some of the muscles of the larynx that cause roaring, has a hereditary tendency. The narrow loins and flat sides that give a proneness to attacks of diarrhea and colic, belong to a certain lienage. This constant tendency of morbid condition or defective organs to re-appear in the line, shows how important it is that horses selected for breeding should be sound in wind, limb, and condition.

For a Cribbing Horse.—Feed with a nose-bag and give hay only from an iron rack. Coating the wood work in a manger with crude petrcleum is also recommended. The bad taste will soon cure the animal of all desire to bite his crib.

Treatment of Shying Horses.—Shying generally arises from timidity, but sometimes it is united with cunning, and induces the animal to assume a fear of some object for the sole purpose of finding an excuse for turning aside. The usual cause of shying is, doubtless, the presence of some object to which the horse has not been accustomed, and if he has defective eyes, which render him short-sighted, it will be difficult to convince him of the innocent nature of the novel object. There are endless peculiarities in shying horses, some being dreadfully alarmed by one kind of object which to others is not at all formidable. The best plan of treatment which can be adopted, is to take as little notice as possible of the shying, and to be especially careful to show no fear of its recurrence when the "alarming" object appears in the distance. When the horse begins to show alarm, but not till then, the driver should speak encouragingly to him, and if necessary with a severe tone, which may even be supported by the use of the whip if his onward progress cannot otherwise be maintained.

The principle which should be carried ont is to adopt such measures as will get the horse to pass the object at which he shies, somehow or other, and this should be effected with as little violence as possible, always commanding in an encouraging tone as soon as the purpose is gained. Nothing has so great a tendency to keep up the habit as the plan so common among ignarant grooms of chastising the shyer after he has passed the object of his alarm. If he can be pursuaded to go quietly up to it, and examwith his muzzle, as well as with his eyes, great good will be effected, but this can seldom be done with moving vehicles, and heaps of stones or piles of sand are generally only alarming from defective vision, so that each time they assume a new phase to the active imagination of the timid animal. Punishing bits only make a high-courraged horse worse, and the use of "overchecks" rarely, if ever, proves beneficial.—*Wilkes' Spirit.*

The selection of a stallion is an important matter. He should be from a family with well established characteristics which he, like the other members of the same family, will be likely to transmit and stamp upon his offspring. He should be of good size, have good bone and muscle, and power and ability to do what will be required in his offspring. He should have a kind and tractable disposition, for vicious characteristics are transmissible. He should have good action, for action is wanted in a horse. If a horse is wanted for draft purposes, breed with that object in view, and breed heavy draft horses. If horses are wanted for general purposes on the farm—to plow, to mow, and to do all kinds of farm work, and also to ride, to drive before the buggy or carriage—then a different horse is wanted—more active, and that can be used more handily for any and all purposes. If he has fine action and gets over the ground rapidly and in fine style, he is better to ride or drive, and will command a high price; for all people will pay for beauty and speed in a horse if they have the means. Many of our fastest trotters have been bred on a farm, by farmers, and worked at farm work. Even Occident, the great California horse, was worked hard (in a butcher's wagon and otherwise) for several years, and after that trotted in 2:16¾.—*Ex.*

There are in San Jose only twenty-one livery stables for the accommodation of the inhabitants of, and visitors to this burg.

Spavin.—The exciting causes of spavin are strains, concussion, and sometimes, though rarely, blows. A kick from another horse has been known to produce one of a very serious character. Any cause which will excite inflammation of the tissues of the joint, is liable to cause a deposition of bony matter, or ulceration of the tissues covering the bones.

The first and most important step to take in the first stages of spavin is to place the animal in absolute rest. The hock joint of the horse and the ankle of a man are anatomically nearly alike. If a person sprains his ankle the surgeon orders rest, not for a day or week, but for a long time, then apply a cooling lotion—cold water freely applied is perhaps as good as anything to arrest the inflammatory action. Afterwards some stimulating application, perhaps counter irritation (a blister) may be necessary to bring the deep-seated inflammation to the surface.

Balky Horses.—The following devices have been successfully tried to accomplish the desired end:

Tying a string around the horse's ear close to the horse's head.

Hitching the horse to the single-tree by means of a cord instead of the tugs; the cord fastened to the horse's tail.

Filling the mouth full of some disagreeable substance.

Tying a stout twine around the leg just below the knee and then removing it when he has traveled some distance.

Never whip a balky horse, for the more he is whipped the crazier he will become. Let everything be done gently, for boisterous words only confuse him and make him worse. Treat him in the mild manner that you would a crazy man, and you will succeed.

A Good Colt of 1900 Years Ago.—We may prognosticate great things of a colt if, when running in the pastures, he is ambitious to get before his companions; and if, in coming to a river, he strives to be the first to plunge into it. His head should be small, his limbs clean and compact, his eyes bright and sparkling, his nostrils open and large, his ears placed near each other, his mane strong and full, his chest broad, his shoulders flat and sloping backward, his barrel round and compact, his loins broad and strong, his tail full and bushy, his legs straight and even, his knees broad and well knit, his hoofs hard and tough, and his veins large and swelling all over his body.—*Varro.*

A Practical Use of Dogs.—It is a fact perhaps not generally known that there is a firm doing business in San Francisco who purchase the thousands of dogs slaughtered by the pound master of that city or that may have been otherwise killed, for which they pay 40 cents each. The carcasses are conveyed to their manufactory at South San Francisco, where the skins are removed and sold to the tanneries, the hair taken off and resold to plasterers, the hide tanned, made into gloves and sold in the market. The denuded carcass is then thrown into a huge caldron and boiled until the bones are easily separated from the flesh, when they are removed and sold to the sugar refineries, where they are ground to a powder and used to clarify sugar. The oil that rises to the surface of the boiling mass is skimmed off and manufactured into cod liver oil, and the remainder is used for the purpose of fattening hogs. *Ex.*

They who are most weary of life, and yet most unwilling to die, are such who have lived to no purpose—who have rather breathed to no purpose.

Porcine.

The So-Called Hog Cholera.

The past season has been very fatal to many of the Western hogs. A large portion of many herds has been carried off by what is known as hog cholera. The disease is so virulent, that before any course of treatment can be determined on, it has run its course, and in the majority of cases most of the herd is lost. Treatment is either of no avail whatever, or if the animal recovers, it is left in such a wretched condition, paralyzed, rheumatic and emaciated, that it is of less value than the cost of restoration. It is therefore necessary to consider how to prevent the "hog cholera," rather than to treat it.

The disease is closely related to the so-called Texan fever, or splenic apoplexy of cattle, and on examining a dead hog, the spleen is found gorged with black blood, soft and greatly enlarged. Sometimes it takes the form of carbuncular erysipelas, or the black leg of cattle, the legs breaking out in sores. It is a true case of blood-poisoning, that results in a fever which may be called typhoid, enteric or intestinal, or anthrax, as persons may choose. The disease can be prevented, but can hardly be cured. It is most common in low, undrained, marshy places, or where the hogs are kept in filthy pens, and have to drink water fouled with their own evacuations. From these it spreads to other quarters where it would not originate. Sanitary measures, good food, pure water, clean quarters, and the regular removal of the droppings, and the abolition of the disgusting practice of permitting hogs to "follow cattle" and consume their excrement, would doubtless entirely prevent it. The most economical thing in stock keeping is humanity, and such measures as would preserve the health of the owners themselves, would immediately remove their stock from the danger of the virulent diseases which now decimate them.—*National Live Stock Journal.*

A Profitable Hog.—The following description of a profitable hog, was reported by the committee, at the Swine Breeders' Convention at Indianapolis, Ind.:

He must have a small, short head, heavy jowl, and thick, short neck; ears small, thin, and tolerably erect, not objectionable if they droop slightly forward; must be straight from the neck back to the flank; must be let well down to the knees in brisket; of good length from head to tail; broad on the back; ribbed rather barrel-shaped; must be slightly curved or arched in the back from shoulder to the setting on of tail; tail small; long in the ham from hock to letting off the loins; shoulder not too large to give symmetry to the animal; ham broad and full; hair smooth, and evenly set on; skin soft and elastic to the touch; legs short, small, and well under; broad between the legs; good depth between bottom and top of the hog; with a pleasant, quiet disposition; should not weigh more than three or four hundred pounds gross, at twelve to eighteen months old, according to keep; color may be black or white, or a mixture of the two. The above described hog will measure as many feet from the top of the head to setting on of the tail as he does around the body, and will measure as many inches around the leg, below the knee, as he does feet in length around the body; depth of body will be four-fifths of his hight.

Old Foggy Farmers.—Is not a farmer an old fogy who will continue to breed the common scrub hogs of the country, when there is undoubted testimony from everyone who has tried the improved breeds, such as the Berkshire, Poland China, etc., that there is a saving of at least 25 to 50 per cent. in feed, in producing a certain number of pounds of pork, by keeping the improved breeds? Is it not everywhere admitted that some animals will fatten more readily than others—that some breeds will fatten more easily than others, on less food? That some breeds of cattle are eminent for their butter-producing properties? That some breeds of sheep are noted for wool, and others for the quantity and high quality of mutton they produce? That some horses are noted for their speed as trotters, and others for their speed as runners? Is it strange, then, that hogs should be subject to the same law of improvement? That skill and care and pains-taking selection of particular animals, should finally give us breeds that keep easily, fatten easily, mature early, and have all the desirable points required in swine? And yet there are farmers who think the hazel-splitting, razor-backed, alligator hog just as good as any. They must believe the world stands still; that there is no change, no improvement in anything. Such farmers we class old fogies.—*Coleman's Rural World.*

The hog is properly a European animal, though the wild hog was found in the mountains of Syria and Asia Minor, and still exists in the wilds of the Atlas mountains in Africa. The prohibition of swine's flesh among the Egyptians and Hebrews, shows that it was known as a domestic animal even in those early times. Among the Greeks and Romans the hog was rather popular as a flesh furnishing animal. It is the most prolific of our domestic animals, and a given weight of flesh can be produced at a less expense than any other form of animal food; but it is the hardest of digestion, and least healthful of all our meats. In cold climates, however, the large amount of fat it contains is important as a heat producing element, and, therefore, Northern nations use largely of pork. The filthy habits of the hog are owing chiefly to his domestication. In the wild state the hog is a cleanly animal, living almost exclusively on vegetable food, while the domestic hog is omnivorous, and quite fond of animal food.—*Rural San.*

How to Keep Boars.—We read about the care bestowed upon stallions, rams and other breeding animals, but rarely do we ever see a word on the care of boars. They are usually raised with breeding sows, and run and worry and become nothing but runts. They go days without food. They disappoint their owners and everybody else. Now, it is just as important to take care of a breeding hog as it is of a horse, and a good snug pen or yard should be used to enclose them. They can be well fed here, and made to grow; and if their services are needed, it is easy to have a door or gate to let breeding stock in. If this plan is followed, one will have a far better animal, and far better stock. The slops of the kitchen, sour milk, vegetables, bran and soaked corn can be fed to him, and he will be a credit to all concerned.—*Rural World.*

A man that will swear at the pig that neglected to eat the acorn that grew the tree from which came the refractory piece of oak he is vainly trying to split, may be said to have gotten down to the *root* of the thing.

Dentition in the Pig.—At birth the pig has the temporary tusks and the corner incisors well up. These teeth are very fine and sharp, almost like needles, and occupy a position on each side of the mouth, leaving a clear space in front. In a month to six weeks the central temporaries are cut, and soon after the completion of the second month the lateral incisors are cut, and the animal has its full set of temporary teeth, including three molars on each side, top and bottom, six incisors, top and bottom, and a tusk each side, top and bottom. At the age of six months the premolars, which occupy a position between the first temporary molar and the tusk, are cut, also a permanent molar, which is fourth in situation. The premolars are not always present, and in their absence the fourth molar will be accepted as an indication of the age of six months.—*Agricultural Gazette.*

A successful swine-breeder says sows should be put in their farrowing-pens about two weeks before the expected time. This pen, for the large breeds, should be eight feet square, and for the small breeds seven feet square. A shelf of one and a half inch plank, eight inches wide, should surround the inside of the pen, fastened securely, with the underside of the shelf seven inches from the floor. This shelf will prevent the sow from lying on her pigs or crushing them against the wall.

This letting males run promiscuously with a lot of breeding stock, and particularly so far as hogs are concerned, can not be too strongly condemned. Every good breeder knows it, and no good breeder will permit it to be done.—*Rural World.*

Quantity of Seed for an Acre.

The following table, from Mr. Gregory's *Annual Seed Circular*, is inserted as giving useful information which is often wanted by our friends in guiding the amount of their seed purchases.

Seed men vary much in their directions for the quantity to be planted to the acre. In the following list we give the quantities of the more common sorts used by practical farmers:

Dwarf Beans, in drills	1½ bush.
Peas, that make small vines	½ do
Peas, that make large vines	1¼ do
Beets, in drills	4 lb
Cabbage, in hills	½ lb
Cabbage, to be transplanted	2 oz
Carrot, in drills	1 to 1½ lb
Musk Melon, in hills	1 to 1½ lb
Mangold Wurtzel, in drills	4 lb
Onion, for bulbs, to sell green or to trace in drills	6 to 8 lb
Onions, for dry bulbs, in drills	3 to 4 lb
Onions for sets, in drills	30 lb
Onion sets, in drills	10 bush.
Potatoes, in drills, cut, depends on number of eyes	8 to 14 do
Radish, in drills	5 lb
Spinach, in drills	1 to 15 lb
Sage, in drills	2 to 6 lb
Squash (run varieties) in hills	2 to 2½ lb
Squash (bush varieties) in hill	3 to 4 lb
Tomato, in bed to transplant	2 oz
Turnip, in drills	1 to 1½ lb

The Illinois Farmer's Association, at their convention at Bloomington, adopted, among other resolutions, one demanding the withdrawal of the national bank circulation and the issue of a greenback currency direct from the treasury, to be made a legal tender for all debts, both public and private, except the principal and interest on the public debt, contracted to be paid in gold, and interchangeable for registered bonds bearing interest, to be paid in gold or legal tender, at the option of the holder, at a rate not exceeding three per cent., said bonds being redeemable at the pleasure of the Government in from ten to fifteen years.

Poultry Yard.

Domestication of Wild Fowls.

BEING an enthusiastic sportsman as well as fowl breeder, I have learned from many years' experience in the hills, marshes, and tules of this country, the habits and merits of many varieties of wild fowl, and am looking forward to the time when I can provide the place, and have the leisure to demonstrate the feasibility of crossing our domestic fowls with those beautiful and edible birds of the valleys and marshes. Mr. Rodman mentions "the peerless Rouen duck, produced from the domestication of the wild Mallard," (or as is generally supposed, the tame duck bred to the wild Mallard, as has the domestic turkey with the wild bird, producing the large and beautiful Bronze turkey), instance also the mongrel goose, so much prized and sought after by the epicures. I think many fine birds could be obtained by crossing several varieties of the wild fowl with the domestic Mallard, as I have seen and obtained several beautiful specimens of hybrids during my hunting excursions in San Pablo and Suisun bays in this State. One I particularly remember was a cross between the wild Mallard and the Pin-tail (commonly known here as the Sprig-tail). These birds are similar in their habits, often flock together, are non-divers, feeding on the mud-banks, on slugs and snails, or in the ponds for grasses and the like. The flesh of the former is very juicy, and of a rich orange color, while the latter is equally rich and juicy and of a delicate white, and finer grained, much like that of a chicken in color. I think the cross would produce a most desirable bird for the table, and by domestication produce as large a duck as the famous Rouen. The only question in my mind regarding their success is the chance or their progeny being "mules." I could mention others that in my opinion could be bred or domesticated with flattering results.

My old lamented friend Ward Eaton, of San Francisco, imported several years ago from Oregon and Washington Territory a dozen or more of the red grouse of that section of country, which he thoroughly domesticated in his yard; but he died before he had fairly completed the experiment of breeding them, and they were finally turned out in the hills of Marin county. What the result has been I have never ascertained. They may have met the fate of most of the Eastern quail which have been brought out here—they having been killed by their stronger neighbors, the California quail, which seems to have taken an antipathy to them and "go for them" as Bill Nye did for the "heathen Chinee."
—*Chas. A. Morse, of Oakland, in Poultry Journal.*

VERMIN ON FOWLS.—The *Fancier's Gazette* speaks as follows: A very important duty of the poultry breeder is to see that his chicks are free from vermin. Sprinkle sulphur continually over the chickens, roosts and houses, the latter two occasionally washed with kerosene. If you find the slightest symptoms of the presence of vermin, get rid of them immediately. Sometimes careless breeders will lose whole settings of eggs simply by not occasionally sprinkling the hens and nests with sulphur, or other good insect powder, and the poor hens, unable to stand the dreadful pests, have forsaken their nests. A careful breeder will never allow the scourge of lice among his poultry to trouble him, but will see that he "has none of it.

FINE POULTRY.

Our attention as been called to the yard of Judge Collins, of San Jose. The judge has spared no expense to get the very finest pure-bred fowls to be obtained in England and America. He makes specialties of the black-breasted Games, brown Leghorns and dark Brahmas. For one trio of Game fowls, he says he paid $75. We have never seen finer birds. He has one Game cock imported from India, called the Wild Game—a novelty—powerfully built, but not a very heavy fowl. The brown Leghorns are beautiful, and just such hens as farmers who have plenty of room for fowls to run about should have. The dark Brahmas are also beautiful, large and extra fine. Being heavy and of quiet habits, they are better adapted to small yards than lighter poultry. This is not saying that heavy fowls are not also good where room is plenty. The other fowls kept by the judge are Game Bantams and Rouen ducks.

One word about Games. It has been found that they are of other, and better, use than to breed for fighting purposes. You will remember that, on general principles, *the healthiest fowls are the best.* Now while other breeds of hens are bred for certain fine points, independent of healthy considerations, the Games are invariably selected for hardiness, strength and endurance. Hence they are standards of excellence in this direction, and are found to be the very best blood with which to cross all other breeds. The chicks are the hardiest and easiest to raise, and there is less liability to get sick among the Games than any other breed. The hens are trim-built, cleanly, good layers, and as peaceable as any hens. The cocks are not more likely to fight than others, unless trained to it, or thrown among strange fowls. The very fact that they fight so desperately, shows the abundance of vital energy they possess. In California, where hens so often get sick, we think this is the best blood to mix with other sorts to insure health.

DOMESTIC FOWLS IN AFRICA.—Dr. Livingstone wrote: "When I was coming through Londa, my men carried a great number of fowls, of a larger breed than any they had at home, (Linganti, almost exactly in the center of Southern Africa). If one crowed before midnight, it had been guilty of calling death to visit the tribe, and was killed. The men often carried them sitting on their guns, and, if one began to crow in a forest, the owner would give it a beating, by way of teaching it not to be guilty of crowing at unseasonable hours." In his writings he very frequently refers to domestic fowls as one of the principal articles of diet, and every tribe in the great region over which he traveled had them; and he stated that it was customary for every tribe that he approached to send men with cooked fowls and other food to meet him, thus showing a genuine hospitality scarcely credible among savages. When he was 350 miles inland from the western coast, he writes: "My men were busy collecting a better breed of fowls and pigeons than those in their own country. The anxiety these people have always shown to improve the breed of their domestic animals is, I think, a favorable point in their character." At Rovuma, on the eastern coast, he said: "The people have no sheep or goats; only fowls, pigeons and Muscovy ducks are seen." Although he mentions the Guinea fowls occasionally—and every traveler agrees that they abound in Africa—it is evident that he more frequently had reference to large breeds of which the cocks *crawed;* for when 550 miles inland from the eastern coast he mentioned the Guinea fowls particularly, viz.: "Guinea fowls and francolins abound."

When Chuma and Lusi, Livingstone's faithful attendants, who brought his remains to England, saw some immense Cochins at a poultry show, they said these fowls were not larger than those they saw when with their master on the islands of lake Tanganika.

It is singular that no other domestic fowls besides the Guinea fowls have been brought from Africa to this country, considering that there are fine fowls there, and that so many have been brought from Asia. Some enterprising fancier should make inquiries of men engaged in the African trade, and try to import some of the large varieties of fowls mentioned so frequently by Livingstone. Africa is a very large and a very old country, and probably the varieties of domestic poultry are many, useful and curious. How did they get there? may be a question of the curious; but a more profitable one might be, How can we get them *here?* Had Livingstone seen those fowls with Mr. Felch's eyes, the account would have been so wonderful and enthusiastic as to have induced some fancier to procure some very soon, but Livingstone was absorbed in a greater matter, and gave them only a passing notice, which, small as it is, suggests the importation of some remarkable fowls from Africa yet. The Asiatic fowls differ much from the European or American, and, doubtless, the African differ from either as widely, judging from the only specimen from that country—the Guinea fowl.—*Poultry Journal.*

WORMS IN FOWLS.—Some years ago I had several fowls drooping about with all the symptoms of cholera, except that they lingered for a longer period. After experimenting with almost every known remedy, I at length determined to make a *post mortem* examination, and, if possible, determine the cause. Accordingly I proceeded carefully, that nothing should escape my notice. Arriving at the intestines, I found that the entire lining was apparently removed, and they contained no less than fifty worms, about two inches in length, and as thick as an ordinary knitting needle, both ends of which coming to a sharp point like a pin. They were white in color and as tough as sinews. I then gave the remaining fowls close attention, and frequently saw that as soon as they passed from one fowl, another would hastily swallow it, and, I doubt not, would soon become affected. At length I hit on the following remedy: After they had gone to roost, I made a strong tea of common worm seed, and gave each one about three tablespoonfuls. Early next morning, before they had left the perches, I removed the dropping from beneath them, and found it literally alive with worms. I again dosed them on the following evening; this time they did not expel so large a quantity. I then began feeding them wheat shorts and bran, adding a little stimulant, and carefully avoiding anything that had a tendency to irritate the intestines. In the course of a week they were seemingly as lively as ever. Since then I have found on several occasions small, conical worms in turkeys in great numbers, and am of the opinion that thousands die from this cause, while it is attributed to cholera. The symptoms from which I detect it are from their slow, stiff, crampish movements, and disorderly, sorrowful appearance.—*Ex.*

RED PEPPER AND POULTRY. I do not know if other persons who raise poultry and pet birds are as much dependent as I am on red pepper; but I have found so much benefit from its use in my poultry yards and bird cages, that it may not be amiss to call the attention of others to its good properties. I do not speak of the article that is sold in drug stores—and sometimes not remarkably fresh—but of the capsicum that grows in our gardens. I have tried all the different varieties, and the most pungent and efficacious is the small kind mostly known by the name of "bird's pepper." The plant in itself is a beautiful object; grows about two feet high, and in autumn its bright little scarlet berries look like coral beads peeping from under the dark-green foliage. Indeed, one plant in a pot is a very pretty ornament for a flower stand. The seeds possess a stimulating and reviving property, and I find that two or three given to newly-hatched chickens, especially if they are weakly, have a most happy effect. If a hen looks feeble after moulting, six of these berries or pods, given daily in some corn meal and sweet milk, improves her wonderfully. Last summer two of my canaries began to droop. Every day I gave them each one seed of the "bird's pepper," and in less than a week they were quite well. The same remedy is invaluable for mocking birds.—*An Old Farmer, in Woonsocket Patriot.*

SCURVY LEGS.—Having seen many cases written out at great length on healing this eyesore, I have yet to hear definitely what is the cause. Many are no doubt ready to say, lice, of course, to which I would say, from microscopic revelations, this is a peculiar insect by itself, and is brought into existence by the adherence of filth to flesh. In short, it is just exactly *Itch.* For a preventive see that your fowls have clear runs and coops; and for a sure and speedy cure, use an ointment of lard and sulphur. One or two applications is sufficient.—*Ex.*

YUNO HEN is one of the two new Chinese Ministers to this country. With a diplomatic Shicken already in Washington the place seems likely to become a first-class poultry yard. Russia might contribute a Pulletowski to help the thing along.

IT is the belief of a writer that many of the diseases incident to poultry are due to neglect in providing them with pure water.

ALWAS thoroughly clean out the nest after the hen is through setting.

EVERY year the use of iron in the manufacture of implements is extending. The best mowers are now made without a particle of wood about them except the tongue and whiffletrees. But iron might be usefully employed to a greater extent than it now is in the furniture of barn buildings and implements in every-day use. Feed-troughs of all kinds, racks and mangers, gutters, drains, gate-posts, gates, fencing, wheel-barrows and many other things now made of wood, would be much more durable and economical if made of iron. The cost would be more at first, but a set of iron furniture in the stables, barns, pens and yards would not need replacing in a lifetime.

MODERN TIMES. "You see, grandmamma, we perforate an aperture in the apex, and a corresponding aperture in the base, and by applying the egg to the lips and forcibly inhaling the breath, the egg is entirely discharged of its contents." "Bless my soul," cried the old lady, "what wonderful improvements they do make! Now, in my younger days we just made a hole in both ends and sucked."

Pisciculture.

Progress in Fish Culture.

From *Harper's Monthly* for March we take the following:

As usual, the subject of pisciculture and the fisheries continues to occupy a large share of the public attention, in view of the popularity of the measures taken looking toward the increase in the supply of fresh-water fishes and the proper utilization of the products of the waters generally.

Of the various State Commissions, those of Virginia, California and Maine have lately published their reports of satisfactory work.

The varied enterprises in which the United States has been engaged during the autumn have been successfully prosecuted, the United States hatching establishment on the Sacramento river, under the charge of Mr. Livingston Stone, having obtained nine millions of eggs, in bulk amounting to eighty bushels. Some two millions of the young were hatched out and placed in the Sacramento for the purpose of keeping up its supply, and the remainder of the eggs were sent East, for the most part to the State Commissioners of Fisheries. The introduction of the young fish into suitable waters was prosecuted mainly during the months of December and January and nearly all the waters of the United States east of the Missouri river have received their share. A very large number were planted in the head waters of the Ohio, the Mississippi, and other streams in the central parts of the United States, as well as in the waters tributary to the great lakes, and those of the East from Maine to Georgia. It is not too much to hope that in a few years most satisfactory results from the experiment will be experienced. Mr. Atkins has also continued his work in collecting and developing the eggs of the Eastern salmon at Bucksport, Maine, and has secured between three and four millions. These, as being taken later in the year, and of slower development, will be distributed in March or April. In addition to his labors with the sea salmon, Mr. Atkins has also secured a large number of eggs of the landlocked salmon from the Grand Lake Stream, in Eastern Maine, some nine hundred thousand eggs in all having been placed in the hatching boxes. In the course of its labors during the summer of 1875, having reference to the shad, about twelve millions of young were hatched out and distributed in various waters by the United States Fish Commission.

A very important enterprise of the same general character is that which is now in progress under the direction of the Fish Commissioners of Michigan, Ohio and Canada. The Michigan Commissioners are now hatching about seven millions of white-fish eggs, those of Canada having almost as many. The Ohio Commissioners were unable to complete their establishments in time for extensive operations this season, but they have at their four hatching stations a considerable number of the eggs of the white-fish, partly furnished to them by the Commissioners of Michigan.

An important movement has been made on the Hudson river by Seth Green under the direction of the Fish Commissioners of New York, in the multiplication of sturgeon. The economical value of this fish is only beginning to be appreciated in this country, although in Europe it has long ranked among those of most importance. But already a large business in the manufacture of isinglass and caviar, as well as in supplying this fish for consumption, both fresh and smoked, has been prosecuted for some time. The Hudson river formerly abounded in sturgeon, which have become scarce, and the object of Mr. Green's work has been to increase the number. An incidental benefit resulting from the multiplication of these fish, it is expected, will be the destruction by them of the stake nets which at present do so much to prevent the natural increase of shad in that river, the nets being too weak to resist so powerful a fish as the sturgeon.

The prominence of the turbot and sole among the more expensive fishes of Europe has suggested the idea of introducing them into American waters; and at the request of Mr. J. S. Kidder, of Boston, the United States Fish Commissioner is now engaged in making preparations for transferring a sufficient number of young fish from the British coast to that of Massachusetts to make a satisfactory experiment, the expenses to be borne by Mr. Kidder.

Fish Culture in the Northwest.—A writer in the Chicago *Times* says:

In no State is fish culture receiving more attention than Michigan. Aside from private enterprise, the State and United States have aided in the work. A State hatchery, under the supervision of Hon. George H. Jerome, of Niles, is located at Pakagon, in which over 700,000 salmon have been hatched and distributed to the waters of the State during the last four months.

A State hatchery for white-fish is also established at Detroit, in which there are now over 7,000,000 of eggs that were taken from the white-fish of Detroit river, during the first week of November, and which are expected to hatch in March. In about ten days after they hatch the umbilical sac (from which they obtain their nourishment) will be absorbed, when they will be "planted out" in the lakes of the State that are thought to be suited to their habits.

The great success that has attended the hatching and letting loose of young shad into the Connecticut and Hudson rivers, and the consequent reduction of price at the fishing grounds, from 50 cts. to a dime apiece for shad, give encouragement to promoters of this enterprise, and inspire the hope that the investment will prove a good one.

At this place, 25 miles northwest of Detroit, is the hatchery of Mr. Frank Clark. The Deputy Fish Commissioner of the United States, James W. Milner, made arrangements last fall with Mr. Clark to hatch out 800,000 salmon eggs and 4,000,000 white-fish eggs. The salmon eggs were obtained from the head waters of the Sacramento river, California. They were out of a lot of 8,000,000 that were obtained there under the auspices of the United States Fish Commission in September last. The eggs arrived at this place on the 7th of October, and commenced hatching on the 25th, and continued up to the middle of November. When first hatched they were about an inch long, nearly transparent, and had a large appendage which prevented them from swimming, but which furnished them their nourishment during the first forty days of their existence. At the end of this the umbilical sac was absorbed, and the fish had grown to be over an inch long, and they required food. It was at this stage that they were "planted out" into streams of Ohio, Indiana, Illinois, Tennessee and Kentucky.

These rivers were selected that appeared to be the best suited to the habits of the fish. Salmon are always hatched in fresh water, where they remain till they are one to three years old. Then, when no obstacles intervene, they go to salt water where they grow very rapidly, and when of ten pounds weight or more they return to propagate their species. It is a well established fact that, if no insurmountable obstacles prevent, they will invariably go to their native spawning beds. It may interest some in Chicago to learn that 286,000 young salmon were turned loose into the Kankakee river during the last thirty days. They were put into the head waters, near South Bend. It is thought by those who have given the subject careful examination that the California salmon *(salmo quinnat)* will thrive and be able to withstand the high temperature of the waters of our western and southern rivers.

Tests were made last summer in the San Joaquin river, a good salmon stream in California, and it was found that the temperature of the water was from 80 to 85 degrees for weeks at a time, which is higher than that of the Mississippi or the Gulf of Mexico.

Mr. Jerome, in behalf of the State is making an experiment by putting young salmon into the lakes, hoping that the fish will be content to remain in the lake and not attempt to push down to salt water over Niagara falls.

Is it not best to make these experiments? The rivers of Great Britain, many of which were nearly barren, and others in which no salmon were found, have by artificial propagation become sources of income to the government and furnish an abundance of wholesome food for the people. What has been done there may be done here, and we predict that the 8,000,000 eggs which have been distributed to various States will produce salmon suited to the streams in which they are placed, and that their progeny will furnish a rich supply of food for coming generations.

The Massachusetts Fish Commissioners have reported for 1875. From a summary given by the *New England Farmer* we quote the following as of general interest: In the remarks upon trout culture great stress is laid on the fact that large and stagnant ponds are not favorable for trout, as the water becomes too warm for the health of the fish; owing to this reason many attempts at trout raising have failed. About 270,000 salmon were hatched last year, from spawn received from the Bucksport, Maine, establishment, and distributed in the headwaters of the Merrimac. A large amount of land-locked salmon spawn will be received from Maine next year; over 75,000 California salmon have been hatched from 80,000 eggs received from that State, and have been distributed through the State. Last year about 5,000,000 young salmon were sent from California to the Atlantic States, besides 2,000,000 placed in rivers in that State. For the completion of the Lawrence fish-way and for improvements of the one at Holyoke, the Commissioners recommend an appropriation of $8000, and $5000 for other expenses of the Commission. The total expense of the Commission, last year, was $6061. Among the ponds leased, last year, was Lake Pleasant in Montague to that town for 10 years; there are 55 leased ponds in the State. E. H. Kellogg of Pittsfield, for the lessees of Pontoosuc Lake in that town, reports that 400 or 500 land-locked salmon were placed in it, in 1875, that they are doing well, and that the leasing of Pontoosuc Lake will result greatly to the advantage of the public.

The culture of fish is one of the most successful enterprises of the times; and it promises great benefits to the wants of man. With proper diligence and care in this matter, warm winters, so generally fatal, as this has been, in the loss of meat, may be regarded with little concern. As an illustration we note that the United States fish-hatching establishment on the McCloud river, a branch of the upper Sacramento, has been operated with great success during the past year. Over 9,000,000 salmon eggs have been obtained, of which 6,210,000 were sent East, arriving in good condition and with a small loss in hatching. The remainder, when developed, will be placed in the Sacramento river. The eggs shipped East were put up in packages of 50,000 each, in alternate layers with damp moss. They were then packed in crates in pairs, surrounded by stuffing to prevent jarring. The total weight of the consignments was over 20,000 pounds; the bulk of the eggs alone was 80 bushels.

Apiary.

Apiculture in California.

A correspondent of the *Journal of Bee Culture* gives his account of his last year's experience at Anaheim as follows:

I commenced here the 5th of last May, with 144 swarms in the old box and Harbison hives, many of them new swarms. As the swarming season here is in March and April, you can imagine how much of the season had passed before the 5th of May. After that time I had to send for my hives, etc., so that I did not get through transferring before the 1st of June. I have increased from these 144 hives to 305, and have taken 20,305 pounds of honey. I expected to have reached 30,000, but calculated too much on honey dew this fall. However, there are 4,000 or 5,000 pounds in the hives now that I will take out. So you see I have taken on an average fourteen and a half pounds per hive spread to that the whole apiary, and I assure you that many of them were in anything but good condition when they were transferred. I have taken in one day, without an assistant, 1,170 pounds of honey, and with an assistant, 1,800 pounds.

My apiary is arranged on a smooth piece of ground, constituting a bench about twelve feet above the land below. The bee house, or honey house, is built on the edge of this bench, or in the bank; so that we can go from the ground of the apiary into the second story of the building where are the extractor, stove for heating water, a small tank, holding seventy-five gallons, etc. In the lower story are the carpenter's tools, bench, etc., the large tank, framed in one corner of the building, stout and strong, boarded up and lined with zinc. This tank holds about 1,000 gallons, is in the southeast corner of the building, and is exposed to the sun by a window on the south side of the upper story. It is covered with a fine wire gauze, and is protected with a partition in the upper story from dust, dirt, etc. The honey is first put into the small tank, where it stands until the trash that naturally gets into it when extracted all rises to the top, when it is well skimmed and the honey drawn off into the large tank below. The object of the gauze cover and exposure of the large tank is to evaporate the honey thoroughly before putting up for market. The honey is draws from the large tank into cans, barrels, etc., for market. The arrangement of the apiary is in paral-

lel rows, eight feet apart, with hives six feet apart in rows, fifty in a row, twenty-five each side of the door to the honey house. My intention is to have an arbor of grape vines for each double row of hives, the rows of posts for trellis eight, and vines six feet apart in each row and each double row, or arbor, to be ten feet apart, the rows running north and south, and hives sitting just under the edge of the arbor, with openings outward, or, the hives on the east side opening to the west. Then I can go under the arbor and between the rows of hives, and be behind each while I work with it. This I like better than any other arrangement for I am always under shade and away from the bees.

I have this season had a temporary shed made by throwing brush overhead, but I intend that the vines shall take the place of brush. My intention is to provide for 500 swarms. This, you see, will take five double rows with 100 hives in each, or fifty hives in each arbor on each side of the avenue leading to the door of the honey house. Thus, you see, I have an apiary of 500 hives in a space of 300x90 feet. The apiary being on higher ground than the front part of the lower room of the building. I am not troubled by the bees in driving a team up to the door to load or unload. My intention is to keep not over 500 colonies in one place.

I expect to go ahead of this year's returns next season. This has been a very poor season, they say, and I suppose it has been much worse than usual, but I will be satisfied if all average with this. I have a little idea in my head by which I expect to go far ahead of anything I have ever done with bees. But I will wait until another season is over before I tell it, and if I make more honey per colony next year than any other man in the United States—well, what then? And this is exactly what I intend to do. I will commence next year with 200 colonies (as bees I handled this year were not all my own). I do not make any calculation on wintering, as bees gather honey the year round.

Can you suggest any plan by which we Californians can realize more than ten cents per pound for nice sage honey? It is better than the white clover honey of the East, and it is a shame that we do not get more than ten cents for it. Our second rate honey is about like the golden rod or smart weed honey of the East, and we get seven cents for it. I have now about 12,000 pounds of nice honey that I would take twelve and a half cents for, and deliver at the depot.

FILLING THE HIVE.—A writer on the subject of how the bees fill their hive, says:

As soon as the central cell is one-eighth of an inch deep, the queen lays an egg in it. She then goes around on the opposite side and lays eggs in the three cells that are built from the base of the central one. She then returns and deposits eggs in the six cells surrounding the first one, and continues to keep the cell on both sides filled with eggs, as fast as they are ready to receive them, thus establishing the center of her brooding nest at the center of the comb structure, and when the comb on each side of the first is brought opposite the center she embraces them in her circuit, thus giving her brood-nest a globular form.

The honey-storing bees keep the store cells above filled with honey down to the brood. As the sheets of comb are widened they come down lower, and as each additional comb sheet is built they occupy more of it, thus storing the honey in an arch or dome over the brood.

The work must progress and will continue in the same order for twenty-one days, if the space be large enough; at which time the brood nest attains its full size, for at the expiration of that time, the cells in the center, first filled with eggs, are vacated by the maturing bees, and the queen returns to the center to refill them with eggs; and as they are emptied in the same rotation in which they are filled, she continues to follow them up, going over the same ground every twenty-one days.

The completion of the brood nest does not stop the comb-building. That continues as rapidly as ever, but as it is not filled with eggs by the queen the honey-gatherers keep it filled with honey, thus surrounding the brood with honey.

Around the brood on every side, and below, there is found a border of cells that are neither filled with brood nor honey, but are partly filled with bee-bread.

AGE OF BEES. The queen passes the period of about three days in the egg and five as a worm; the workers then close her cell, and she immediately begins to spin her cocoon, which takes her from twenty to twenty-four hours. On the tenth and eleventh days, and perhaps a part of the twelfth day, she seems to be exhausted by her hard labor. She now remains in almost complete repose; she then passes four or five days as a nymph, and on the fifteenth or sixteenth day a perfect queen is attained. Much depends upon the strength of the colony and the heat of the season, which will vary it from one to two days.

The drone passes three days in the egg and about six in the worm, and changes into a perfect insect on the twenty-fourth day after the egg is laid. Much depends on the strength and heat of the colony, which should be about 70 degrees Fah., for their speedy development. They lay in rather a dilatory state for several days after they hatch before taking wing.

The worker spins its cocoon in thirty-six hours. After passing three days in the egg in this state of preparation for a new life, it gradually undergoes a great change, and becomes armed with a firmer body, with scales of a brownish color, and somewhat fringed with light hairs. On its belly it has six rings or scales. After it has reached the twenty-first day of existence—reckoning from the egg—it comes forth from the cell on the twenty-first or twenty-second day a perfect insect, and is termed an image.—*Practical Farmer.*

HOW TO FILL EMPTY COMB.—A correspondent having asked Mrs. Tupper the following question, "How can we best fill a number of hives of empty combs with bees? We have ten living colonies, healthy, though weak, and twenty-nine hives full of comb," she replies through the *Iowa Homestead* as follows: The best way to fill up your comb is to watch the bees when warm weather comes, and every few days put one empty comb between two that the queen has filled with brood. In this way you will soon have any hive full of brood, if honey is plenty; if not, you must feed quite liberally with sugar syrup. There will be no trouble in getting your hives all full of bees again if you manage in this way. If the season is good, it may be necessary for you to extract honey frequently from the comb, to give the queens room. I have followed the above plan successfully for a number of years, and can therefore recommend it.

CALIFORNIA HONEY. Among other numerous products for which California seems destined to become famous, honey ranks as by no means the least valuable item. It has already found its way into the eastern markets, though so far in limited supply, and is much admired for its purity and delicacy of flavor. Its production is not limited to any part of the State, but at present it is chiefly made a specialty in San Diego county, near the Mexican border. The honey crop of that county for 1863 was 119,000 pounds, and it is expected that it will this year reach 200,000 pounds. The bees commence working in that county about the 1st of February, and the season for storing honey lasts from June to September. The finest honey is made from the flowers of the sage, which grows there in such abundance. This is the true sage plant, and must not be confounded with the "sage brush" of Nevada and the northern counties. The flat top or "buckwheat greasewood" also affords excellent honey. The bloom of this plant closely resembles that of buckwheat, hence the name. The flower of the sumac is another source, and the ice-plant, which covers so much of the country, is likewise much sought by the bees.—*Farmers' Union.*

HONEY.—The Ventura *Signal* of January 25th says: The production of honey has in the past, in this county, proved quite remunerative, and we are pleased to observe that our bee men are taking great pains to place their honey in the market in the best possible shape, and will thus make still more from it. It is a source of revenue which increases in importance each year. It is impossible to flood the market with such honey as is produced where the white sage abounds.

W. H. SEWARD'S ENERGY.—Judge S. gave his son $1000 and told him to go to college and graduate. The son returned at the end of the Freshman year without a dollar and with several ugly habits. About the close of vacation the judge said to his son, "Well, William, are you going to college this year?" "Have no money, father." "Very well, my son, I gave you all I could afford to give you. You can't stay here; you must now pay your own way through the world." A new light broke in upon the vision of the young man. He accommodated himself to the situation; left home, made his way through college, graduated at the head of his class, studied law and became Governor of the State of New York; entered the cabinet of the President of the United States, and made a record for himself.

TRIAL OF FARM IMPLEMENTS.—Mowers, rakes, reapers, tedders and horse forks were last season publicly tested at Elmira, N. Y., under the auspices of the Farmer's Club of that place. Twelve mowing machines were entered, including the Wood, Union, and Sprague. The *Country Gentleman* says the committee on mowers, five in number, found on comparing preferences that *each had voted for a different machine*, and hence no agreement as to the best was reached. On rakes, the preference was awarded to the Coates; on reapers, to Hubbard's Meadow Lark; and on tedders to the Bullard.

IMPLEMENT TRIAL AT THE CENTENNIAL. The Centennial managers have secured the use of nearly fifty acres of good land on the Philadelphia and Trenton railroad near Schenck station, which they propose to devote to an international trial of agricultural implements of all kinds. The Centennial Agricultural Bureau has already had this tract plowed so as to be in readiness for next year.

Women.

The Farmer's Daughter.

BY ANNIE L. JACK.

She lives within a quiet home,
No model of the graces,
Unknown to culture's higher walks,
Or fashion's giddy places:
A thoughtful girl, so sweet, so wise,
With earnest face and loving eyes—
The farmer's gentle daughter.

From morn till eve the little maid
Is busy at her labor;
She sweeps and dusts the old farm house
And helps a poorer neighbor.
No gossips will she listen to
(A merit rare, I own you),
So lives the farmer's daughter.

On baking days her tiny hands
Are busy at the making;
No bread more light and sweet than hers
Was ever made by baking.
She churns the butter golden, sweet,
And keeps the dairy white and neat—
The farmer's useful daughter.

Her garden is an Eden fair,
A bloom with pinks and roses—
She knows the name of every flower,
And makes some gorgeous posies—
Grows peas, and radishes, and cress,
And corn, and squash, and herbs to press—
The farmer's happy daughter.

Long may she bravely smile on us—
Our darling housebold fairy,
The queen of garden, house and lot,
And princess of the dairy—
To teach us by her pleasant way
To love the things of every day—
God bless the farmer's daughter.

OPEN LETTERS TO WOMEN---NO 1.

BY CHARLOTTE.

AMERICAN SOCIETY AND ITS ISSUES.

DEAR EDITOR: It is difficult to fairly reach the varied interests of our sex, so much has been said and written prejudicial, not only only to us especially, but to humanity in general. It is through both masculine and feminine influence upon coming generations that humanity is to be perfected and completed, thereby fulfilling the Creative Mind's purpose in making a world and peopling it with men and women.

In Miss Emily Faithful's thoughts, there is much of truth, strength and practicality. What is true in England, is also true in America of women as a class to-day. But Miss Faithful got at the right way of remedying past and present evils, conditions and circumstances over which heretofore we have had no control. Our country and our time demands that we unite, laboring from her standpoint, and in her department of the great work, education and elevation for women, or woman's "real needs," as she expressed it.

And now, as we have introduced ourself, we want to ask the close attention of all our sisters to whom this may come, simply as earnest talks about ourselves and our association in the various economies of life, in which drama we are such important actors. We wish to speak strongly and feelingly, and trust that our language will be plain and pointed.

Phrenologists tell us that man (we use the word generically) "is a social animal." And truly it would seem, when human thought, expression and action are viewed metaphisically—taken together with all its consequences for good or ill—that sometimes the word "animal" is indeed befitting. But we seek not to be sarcastic. The mind grows upon what it feeds, therefore we cannot tolerate Dean Swift's odious carricatures, nor with him believe that to hold up, or keep before the public, vice, immorality and coarse-

ness, will disgust the mind to the forsaking of all that will vitiate, blunt, or destroy the finer sensibilities.

Our own emulation is the Addison school, believing that the holding up before all people truth, purity and beauty, all that refines, elevates and touches, will at last bring about purer morals, finer feelings, more tender and beautiful examples of human love and human sacrifice.

Especially do we realize this when we consider that much of what the world contemns is only in the seeming—that, from its very nature, evil must destroy itself eventually. We would not say that the immortal Dean's proclivities were vile or ignoble, but his greatest forte seemed to be in exciting the more comprisibilities of his readers by rather indelicate, vulgarly-spoken comparisons and allusions. However, all this is neither here nor there for the question before us, viz.: social association, interest, merit, demerit, and consequences, which takes in both sexes equally, with only this difference, viz.: that there are involved by far the most largely and lastingly, feminine morals and perfection.

First—It is very gratifying to contemplate *true womanhood*, the sublime mission and responsibility of the feminine soul; but we do not love to think of our sex's enslavement to fashion, pride, frivolity, and often inexcusable ignorance. And we may deserve sometimes to be told of these faults with censorious harshness, but in person we must protest against Gail Hamilton pitching us all about so summarily, although she says many thing only too true, and many a gem of thought flashes from her potent pen, yet she is too caustic. Also wise Dr. Holland, of *Scribner's monthly*.

We cannot all be Martha Washingtons, Mrs. John Adamses, Isabellas, Queen Elizabeths, Victorias, and Cornelias, mother of the Gracchi. Why? Because circumstances, fortunate or unfortunate, govern the world. Those whom fortuitous chance makes rich, are the ones to bear the blessings and helps can be cultivated, refined and intellectual—*they* can accomplish a mighty work in the domestic and social realm. Such wives, mothers, sisters and daughters are "the cities set on a hill." But those women to whom life is unavoidably nothing but a tread-mill of deprivation of all educational influences, bringing to them poverty, toil, hardship, disappointment, obscurity and destitution, whose very existence the beast of burden is which keeps the mill revolving—*these women!* what can *they* do toward begetting men and women of God-like souls, great intellects, exhaustless patience and affection?

We are told that "it is the father's place to provide the material of the household; the mother's, to train the intellectual." But these women—*these women!* how are *they* to train the intellectual? They who often and often have neither time to eat or sleep sufficient for physical, mental or moral growth, and of whom the full half (including all nations and countries) can neither read nor write, who are unable to think of anything beside inexorable tasks, the endless chain-power which compels stepping, stepping, ceaselessly stepping, but getting no farther on—these are the candles destiny lights and places "under a bushel."

Dear ladies, let us not be understood as charging the blame of the existence of poverty, crime and misery upon any class, any community, or individuals, as abstract cause. The bare *fact*, none can prevent; but it is with its details, its amelioration, palliation, extent, and control that we, the differing casts and classes, have to do. It is in keeping evil down—destroying it—that men and women ought to be interested, earnest and vigilant. Overcoming evil with its opposite, is the great work of men and women to-day and henceforth, because everything good and god-like depends upon virtuous action.

But it is indeed true that too many of us who can labor for human regeneration have too long been content to seek amusement in fashion, ostentation and rivalry. Our mania has not been very severe for self-elevation and mental acquirements — perquisites stronger and more enduring than was ever "a love of a bonnet," latest styles of apparel, or faultless coiffure. Feminine excitements are generally not of a high character to educate and develop, in a proper direction, the masses of women for any and all exigencies of individual thought and action.

Masculinity, too, has had a large influence in making our character what it is—an influence which they are beginning to see and to be ashamed of. Sentimental philosophy holds out the seductive idea that woman is man's treasure, his charmer, his hope, his pride; but as yet it helps us very little to find out why we are of so much value, and how a correct valuation of ourselves is best attained.

We must not longer deceive ourselves with the impression that men's respect and esteem is secondary to their love and admiration, and to secure these last, the truer, better feelings must be suppressed, allowing the inferior in human nature to be the only requisition as aids and counselors.

We should always speak the truth, and confess that their admiration, their love, is of immense importance to us; but it is a vital mistake to suppose that, in order to possess it, we need only know how to make superficial little speeches to them—to flirt, fascinate, and lead captive by "physical eye batteries," instead of real, intellectual, earnest soul-power.

High mental preferment should beget a more lady-like bearing and attractiveness, enhancing appreciation of social and sexual relations; and, certainly, that woman who excels in piquant brilliancy, where desultory badinage is requisite, passing easily and ably to graver, profounder themes, bringing out depth and strength of soul-endowment—surely *she* can, and must, call forth a greater degree of reliable admiration from the masculine—add zest to pursuit -enjoyment to possession.

What, pray, in all ages has made, and at present makes women what they are? Will men or women deny that it is the ignorant oppression—narrow selfishness—a want of intellectual culture, induced by the prevailing habit in American society among men of indulging and humoring the weaknesses and foibles of woman, and requiring too little mentality of them?—a course most unwise, depreciating and ignoble—the *real foundation* of what, in later times, has become known as masculine oppression, injustice and wrong. Out of this habit comes another danger, of which we will speak at another time.

Taxation Without Representation.

We have always regarded *Harper's Magazine* as very conservative upon the question of woman's suffrage. In the March number of this excellent monthly we find, in the "Easy Chair," the following, which our *better half* requests us to quote as very much to the point, and of interest:

Last year, when the celebration of the Centennial anniversaries began at Concord and Lexington, some of the sincerest and most faithful friends of fair play for women declined to take any part or interest, because Concord Bridge and Lexington Green, they contended, are famous for the defense of a great principle, which, these protestants insisted, those who managed the celebrations resolutely opposed. This principle was one of which we shall hear very much in this Centennial year—that there should be no taxation without representation.

Sundry ladies have recently been urging this rather familiar American principle upon a perplexed committee of the New York Legislature. The Chamber was crowded, as it always is upon such occasions, and the ladies had it all their own way. The Easy Chair does not say this "gallantly," but sincerely, for there is no adverse argument. When we, either consciously or ignorantly, permitted women to become owners of taxed property in fee, we surrendered the case.

If a stupid and drunken man, owning a handsome estate in the country, may have a voice in the selection of the representative who is to lay taxes upon it, why should not his next neighbor, an intelligent and sagacious woman, owning a larger estate and paying taxes upon it, have an equal voice in the selection of the imposer of the taxes? Does the fact of sex destroy the principle? But is the Centennial year famous for the vindication of the political doctrine that male taxation and representation should go together, or simply that taxation and representation should be so united? Did Sam Adams, or James Otis, or Patrick Henry, or John Jay, or any of the heroes of '76 qualify the assertion of their principle by any word denoting sex? Or, when they declared on a certain famous day that all men were created equal, did they mean, as was gravely contended by so "practical" a politician as Mr. Douglas, that white men only were so created, and therefore?

But certainly they meant white men, interposes the objector, for at that very time they held black men in slavery; and certainly, he says, they meant male taxation, because nobody ever thought of a woman's voting. The Easy Chair once heard the ladies arguing for this claim in the same Assembly Chamber in which the perplexed committee lately sat, and the committee of that earlier day were equally perplexed. The members smiled good humoredly at the absurd claim, and they responded "gallantly" to every question, and were quite willing that the "good ladies should have their say." In the Speaker's pulpit stood Mrs. Stanton in the summer evening, tranquilly fanning herself, and with candor and force and good nature asking the terrible questions, to which no member of the committee had any other distinct reply than that the suggestion, if made in earnest, was simply preposterous. When any one of them remarked that the actual circumstances and practice of the men of the Revolution showed that they had no thought of such an application of their principle, Mrs. Stanton asked, with an amused smile, whether, as philosophers and logicians, they ought not to have thought of it, and whether their blindness was a reason that we should refuse to see? If men proclaim a principle of action which by its very nature is gradually seen to be more and more embracing is its operation always to be limited by the narrow vision and selfish aim of those who promulgate it? If, she asked, gently waving her fan, as if to scatter mosquitoes—if, gentlemen, representation should go with taxation, ought not all intelligent and moral native tax-payers to have a voice in the choice of the representative? One of the committee, who declined to go into the corner, murmured, "Not if they are women." "And why not if they are women?" "Because God did not intend that women should vote." "And where does He say that He intends that men should vote?"

There was one woman a hundred years ago who is perhaps the most famous woman of the Revolution, admirable in every capacity of woman's peculiar sphere, and equally fitted for the common sphere of men and women in human society. This was Abigail Adams, the wife of one President and the mother of another. She at least was reasonable and logical, whoever is not. Writing to her husband, who was in his seat in the Continental Congress, on the 31st of March, 1776, this typical American matron says:

"I long to hear that you have declared an independency. And, by-the-way, in the new code of laws which I suppose it will be necessary for you to make, I desire you to remember the ladies, and be more generous and favorable to them than your ancestors. Do not put such unlimited power into the hands of the husbands. Remember, all men would be tyrants if they could. If particular care and attention is not paid to the ladies, we are determined to foment a rebellion, and will not hold ourselves bound by any laws in which we have no voice or representation. That your sex are naturally tyrannical is a truth so thoroughly established as to admit of no dispute; but such of you as wish to be happy, willingly give up the harsh title of master for the more tender and endearing one of friend. Why, then, not put it out of the power of the vicious and the lawless to use us with cruelty and indignity with impunity?"

Again, in the following May, she says: "I cannot say that I think you are very generous to the ladies, for while you are proclaiming peace and good will to men, emancipating all nations, you insist upon retaining an absolute power over wives."

The tone of affectionate gayety and feminine dependence does not affect the deep and sweet seriousness of passages that show how penetrating was the glance of this admirable woman. Indeed, she but expresses the instinctive feeling of most of the noblest minds and hearts of her sex. But Mrs. Abigail Adams would have pleaded in vain before a committee of the Congress in which her husband sat. The smiling and affable chairman would have heard her courteously, and would then have replied: "Dear and respected madame, when women show that they feel the deprivation of the ballot to be a grievance, this Congress will take the subject into serious consideration. You must excuse us if we cannot regard your individual views and wishes as those of your sex. We are inclined to believe that most of them would consider the ballot to be an oppressive burden imposed upon them, not a desirable privilege. Home, not Congress, is the sphere of woman, dear madame—at least that is our opinion, and that seems to have been the universal opinion and practice of mankind. You and your fellow-petitioners, dear Mrs. Adams, have leave to withdraw."

This is very much the speech that the affable chairman contrives to make, if he makes any. Its argument really is that no political reform should be made until the wrong to be corrected has become so intolerable that is a general cry and protest. Nothing must be done in regard to the relations of capital and labor until

the peace of society is evidently imperilled. Nothing must be done about slavery until the chain eats into the flesh and wrings a cry of agony from the lips. No measures must be taken against pestilence until it is decimating the population. Statesmanship is never to try to prevent, but only to alleviate when political disease has become desperate. Foresight, sagacity, comprehension, the salvation of the state from the moral deterioration and the economical loss of acknowledged abuses, these are not to be considered as elements and purposes of political wisdom. The practice of ages and of mankind is to be our guide, as if it would not justify every enormity and folly. Home, not somewhere else, is the sphere of woman, as if the only condition of home to most women were not that they should toil somewhere else. Finally, the intelligent should not be allowed to do what the ignorant do or wish to do. The affable chairmen must do better than this. Their wisest way is to smile only, and not to attempt to answer Abigail Adamas, under whatever name she may appear.

Household Reading.

Home.

BY GEORGE SWAIN.

Home's not merely four square walls,
Though with pictures hung and gilded;
Home is where affection calls,
Filled with shrines the heart hath builded.
Home! go watch the faithful dove,
Sailing 'neath the heaven above us:
Home is where there's one to love us!
Home is where there's one to love!

Home's not merely roof and room—
It needs something to endear it;
Home is where the heart can bloom,
Where there's some kind lip to cheer it!
What is home with none to meet,
None to welcome, none to greet us?
Home is sweet—and only sweet—
Where there's one we love to meet us.

UP-COUNTRY LETTERS---NO. 4.

BY RACHEL A. ELY.

CHANGE and motion, it is said, are the eternal laws of nature, and we mortals' lives are no exception to her rules. Scarce had I taken a deep breath of air invigorated by mountains, into my weary body, when my good, kind hostess was taken dangerously ill. As I feared, a long account was to be settled with over-taxed nature. And, as they were dependent on the friendliness of neighbors to care for her and the children, I felt it best to find a new home. So here I am, in the sunniest, cheeriest spot imaginable. Already I feel the calm, quiet atmosphere of peace which pervades the household. My room is a southwest one, consequently always sunny, my new hostess and friend says a sick room always should be. The west window opens on the porch, over which the delicate and fragrant honeysuckle and clustering grape vine will soon make a bower. Already I see traces of their work—swelling of buds and the like.

In my new home I have teacher and physician combined with hostess and friend. Oh! why are there not more of such in the world? But I shall confuse you, perhaps,—and myself, too—unless I quietly paint my new life, and the new hopes and worlds of usefulness which are opening to my view. Five children and one hired man, besides the father and mother and myself, constitute our family. And, though farmers, they have but two meals a day. Meat once or twice a week; no tea or coffee, but chocolate, or a gruel made of oatmeal or Graham flour, or boiled cocoa shells, every morning instead. But the children prefer, as do I, fresh, warm milk. The Graham rolls, or gems, or corn cake, are truly sweet and delicious. My good hostess seems amazed at the ignorance and folly of the country people generally in not eating it more. Then fruit is a staple article of diet at each meal, and the vegetable garden, kept the year round to furnish something green each day, is indeed a blessing. But what surprises me most is the ease with which this woman performs her daily duties. To be sure, she wears a short dress, and has only to get two meals a day; yet that can't really make such a difference, can it? Let me see—breakfast at eight, at which all the children but baby are dressed neat and clean, and ready for school. On the table is a big dish of Graham or oatmeal mush, boiled or baked potatoes, a pitcher of fresh cream, warm milk, a plate of golden butter, and another of hot gems, with a fragrant glass of fruit, canned and most luscious to behold. Surely a breakfast for a king—and easy to get, too. The men have done their chores and been at work an hour or more, and now come in with hearty appetites, as do we all. The children go to school, and the mother, whose tasks are already in part done, gathers up the dishes, and as she has a sink and water handy in it, a permanent boiler on the stove also, which the man fills each morning, it is but a trifle to wash, wipe and put away the dishes in the closet at her right hand, not a step away. Meantime I sit in the sun by the open door and watch the quiet, happy baby, who has taken care of herself so long on its own rug on the floor, and begin to frame a world of questions to ask this woman as soon as baby is bathed and dressed and nursed to sleep. The children do not return from school until three, so that we dine at half-past two, they getting in by the time we are only *quietly* hungry, and can listen to their day's mishaps and joys. The dinner is composed of two or three kinds of vegetables, cold rolls or loaf bread, fruit, and a pudding of some kind, and always a truly lovely boquet of fresh flowers, gathered by the children on their way from school or from the front garden. After this meal the two eldest children clear away the table, wash and wipe and put away the dishes, while the mother continues her sewing and the others play with the year-old baby. A lunch of bread and fruit, after the day's work, is socially set in two dishes. Such is the daily routine of this household, except washing-day, which she has a way of turning off in the same easy manner.

I really forget my own aches and pains, if I have any, in these days, so busy are my thoughts in questioning wherein this little woman is superior to the other, and to most every wife and mother in the land. I have about concluded that she not only has brains, but uses them—applies them to her daily life, and practices what she preaches. And this is the woman I have heard sneers about—short dress, hygienic woman doctor, strong-minded woman, and many more less becoming epithets! Well, I myself should not have known her worth without this chance, which has made me a silent spectator of her family and its workings.

GRANDFATHER'S LETTERS---NO. 7.

AUNT MARY'S REPLY TO INGLEWOOD.

Dear Inglewood: True, we cannot but coincide with you in thinking—yes, and knowing how necessary is congenial, suitable companionship in life's journeyings. With every word you say on that subject we heartily agree; but with all this there yet remains an individuality that, under certain conditions and circumstances, must still remain intact. You may have yet to learn how much your own individualism may be merged in that of another, and how much that other's may be merged in yours; and what is to be the result when they will not thus merge together? Ah! I know you men, prior to marriage, during the courting season, feel like giving in to every suggestion of your lady love, but the case becomes too often sadly altered afterwards, when imperious self-will seems to usurp the place where formerly love for that other reigned supreme, and self was but of secondary consideration. True, we admire masculine supremacy and the right to reign in its legitimate sphere, but there it must be kept; just so of the feminine supremacy, that also must be kept to its legitimate sphere, all subject to that higher law of our nature in the intellectual, moral and spiritual, and love, pure and holy love, presiding over all.

Ma and I, and even Angie herself, every one of us, feel the importance of the event to which you allude, and if the young felt it as we older ones do, doubtless more would be restrained from entering upon it. However, nature asserts her own rights. I rejoice to see those who recognize those rights, in the highest departments of their natures. As to those rights, Mr. Inglewood, I appeal to you before you proceed further, when you come to discover that Angie's individualism differs from your own, and in some cases cannot be brought to merge into yours, how will you take it? We claim for Angie some rights of body and soul that no earthly power may take from her; for the former, the due preservation of her health, and for the latter, its salvation according to her peculiar notions of that subject. Your notions might take a turn quite different from your own ideas on those things. If so, can you still say, "My beloved Angie, your health and your salvation are as dear to me as to yourself. Do as you think best. I forego all in your favor, so long as you do not require a tour to Europe for the former, nor a hundred-dollar mass for the latter." Of these extreme cases, truly there is no danger, but I cannot say if there may not be something in that direction that may require, on your part, some self-control, and self-abnegation enough, at least, to subdue that imperious self-will and treat that other individualism with the courteous, loving-kindliness of manner that you would like to have meted out to you in like circumstances. Now is the time to think over these things, Mr. Inglewood.

As to that to which you refer "the physical conditions and circumstances," you authorised by ma and Angie to say if the soul affinities are all right, they will not fear for the other, but trust to that good providence that always rewards the energetic and industrious, and trust if Angie's present state of health continues, she may have heroism enough to take her own position on life's great battle field, and mutually aid her companion in his arduous efforts for victory. And here let me say to you, either as an accepted lover or a probationary one, never use deception; be frank and true in all your statements; abhor deception as you would a lie, and when you have fairly won that heroine from a pure good home, who can say "what is good enough for you is good enough for me," and you have the tact to retain that love all your life long—and it will be your own fault if you don't—you will have won a prize of which you may be proud till your dying day. Truly, your friend,

AUNT MARY.

WHAT YOUR NEIGHBORS KNOW.

BY ELIZA E. ANTHONY.

If you wish to find out anything about yourself, ask your neighbors; they will be sure to know. They can tell whether you live happily or not; and, of course, it would give them more food for reflection if you did not. They know how many visitors you have, and will peer through the window-shutters for hours, in the hope and expectation of finding out some news. If you venture on the street in a new suit, your neighbors wonder how many more new clothes you are going to buy, and how your husband can get along with such an extravagant wife; and, with raised eye-brows and pursed mouths, they will shake their heads and exclaim, "Poor man! how I pity him; but you couldn't expect much else from her." If you venture out without your spouse, your neighbors are on the *qui vive* to find out where you are going, and whom you are going with. One will say that you are a flirt; another will repeat it, with the *addenda* that you have left your confiding spouse, and so on, until the mole-hill becomes a mountain; but endeavor to trace it back, and you will get no satisfaction but "They say." If you are single, your neighbors wonder when on earth you are going to get married, and kindly (?) add that you have tried often enough, but always failed—and no wonder. For their part, they could not see what there was attractive in such a looking specimen as you were. Now if it were their Ella or Rafella, the men would be sure to propose; but you—bah! you were cut out for an old maid. When you are married, your neighbors all flock in, and pry and peer into this room and that closet, and praise everything, from your husband down to the feather pillows. But, after they have left your house, they compare notes. One says, with a sniff, that the curtains were only cheap, cotton lace; another, that the table-cover was actually darned; a third, that you need not put on such airs, for your carpet was only ingrain, after all; and she didn't see why you had so many hanging baskets and vines, unless it was to catch the dust; and then they all groan, and say that you will come to the poor-house, and you deserve it for being so extravagant, and they pity your husband for being so foolish and indulgent, and only wish they had control of you for a short time. You are entirely too independent and don't-care in your manner to suit them. Wouldn't they like to sober you down? Oh, no! If you visit the post-office oftener than once a month, your neighbors wonder who you correspond with. There must be something wrong, and your spouse ought to know it. For they actually saw you receive six letters at one time, and gracious knows how many papers. The idea of a married woman receiving that many letters more than once a year, and then *such* a bundle of papers! For their part, they can't find time to read the papers, they have so much else to do (i. e., gossiping), and think a woman must be crazy to want to know about affairs all over the world, and don't see what earthly good it does you to know about current events. They don't understand how you can perform your household duties and also write for the papers; but of course your husband comes home and sits down to a half-cooked meal, while

you are writing "The Trials and Tribulations of Timothy Toodles, Esq.," with your hair dishevelled, slippers down at the heel, and fingers stained with ink. But if they happen in at meal time (as they generally do), and find you presiding at a well-laid table, with no signs of ink about you, they say sweetly, "What an admirable house-keeper you are, my dear; your husband ought to be proud of you."

A good neighbor, in whom you can confide and trust, is a jewel of untold value; but from people who are inquisitive, deceitful, and fond of slander and gossip, may the Lord deliver us!

Santa Cruz, Feb. 1876.

THAT LETTER FROM ITALY.

"Who is the European correspondent? His 'Letter from Italy,' in March number, is certainly most interesting and entertaining." This question asks a contributor. We gave his name with the letter. Mr. James S. Lippincott was one of the editors of the American edition of Chambers' Encyclopædia, and has attained a high standing for literary ability. Now, a ripe scholar, he is spending his time in scientific pursuits and recreation, in traveling. While in California, he made extensive collections of plants, and his good wife, who always accompanies him in his travels, paints all the most beautiful and strange flowers and plants in a most natural style. What he designs to finally accomplish in this direction, we know not. But this we do know—while in California, we found him and his wife, personally, to be very modest and unassuming, yet companionable and warm friends.

We will add to this a portion of a private note which came with his excellent letter:

"Naples, January 21st, 1876.

"We have been in Europe about eight months, and purpose to pass eight or nine more, and have greatly enjoyed it, though it is my second visit. Switzerland is a glorious country, rivaling Colorado and California in scenery, and Italy is full of interest. A month at Florence and a month at Rome were filled with pleasure. I submitted the paper on crossing animals in your paper to our best zoologist, who pronounced it a canard, as several of the animals employed had not been imported into Europe. The copies of the Agriculturist sent me have been read with interest by some of our fruit growers."

We will state that the article referred to in the above, "crossing cattle," is the one that appeared in March, 1875, under the heading "Cattle Hybridization," giving the experiments of Mr. Adraanzoon Van Koppenael, near Leyden, Holland. We credited the article to the *Rural New Yorker*, and it to the *World* as furnished by a Brussels correspondent. If the experiment is a *canard*, the writer certainly shows ability for ingenious originality and cogent reasoning that would deceive the wisest and most experienced cattle breeders. We regret the article was not really true.

FAMILIAR TALKS---No. 9.

BY SNIP.

The author of "Up-Country Letters" tells of a woman who is always at work, and the majority of those who live on farms seem to belong to that class whose work is never done. But there are some housekeepers who, apparently, always have their work done. No matter what time of day it may be, you will not find them at work, except just at meal time. One such I was acquainted with, and one day she told me how she managed. All her work was done before breakfast. The washing must be done on Monday, rain or shine. She got up at half-past three or four o'clock, soon as possible got to washing, and not until it was all done did she get breakfast. The next day she was up at five and did the ironing before getting breakfast, and so with all her work. I did not wonder that she was delicate. The strain upon one's system by such a course cannot be small. For in the morning the stomach is empty, and the system needs sustenance before any very hard work is undertaken. Dr. Hall, one of our great sanitarians, writes very strongly against exercising much before food has been taken into the stomach in the morning. To return to the wash-tub: I prefer to do my washing on Tuesday, in pleasant weather; at other times, just when the weather permits. By washing on Tuesday, I can put the clothes to soak on Monday evening. I heat water and make a good suds, and the clothes wash much easier than if they had not been soaked. The most of the people rush into the washing as soon as the breakfast table is cleared, and after bending over the wash-tub two-thirds of a day, have to sweep, make beds, and wash the dishes. I used to follow that plan, but for more than two years past have taken the opposite course—do all my housework first; then, when the washing is done, I can rest at once. To be sure, I am a little late getting my clothes out, but I never care for that, for I know that as soon as the washing is done, I shall beat liberty to rest, read or write as I may wish.

I hope "Grandfather" has not deserted us, without telling us what became of Inglewood and his love-making. If "Grandfather's Letters" are a true recital of love-making a century ago, I think it must have been a queer affair. But few gentlemen now would receive a favorable answer to their suit if they were afraid to tell who they were. Neither would many girls put the matter into Aunt Mary's hands. Perhaps it would be better for a good many of them if they would, for so many of them do not attach the importance to marriage that they should, but seem to regard marriage as the great *desideratum* of woman's life; never stopping to think of the years to follow, with more trouble and sorrow than they dreamed of during their girlhood. But what use of talking to them and telling them not to be in a hurry to get married? They only think that those who talk so are old fogies.

FRIENDLY LETTERS--No 2.

BY MRS. M. E. T.

A REMARKABLE MENTAL CONDITION.

Alone, with not a sound to break the stillness of a quiet Sunday evening, save the regular tick, tick, measuring time's unceasing march, I find my thoughts wandering here and there, in a strange sort of way, at mystifying whys and wherefores.

There is so much to worry us; so much that we mortals cannot understand, that no wonder the mind grows bewildered, and is lost in the vain endeavor to solve some perplexing theory.

It was this peculiar mental condition, "a mind diseased," of which I was last thinking, when the desire came over me to relate to others the strange freaks of one I well knew while laboring under this mysterious malady. The story is quite true, and may prove interesting to the readers of The California Agriculturist.

My first recollection is of a pale, sad-looking woman, whose dark, mournful eyes deeply touched my childish sympathy. Ever in the same little corner I saw her. Day after day, year after year, she sat there, quietly spinning. Her little wheel seemed a thing of life to her—the recipient of all her silent affection. She never smiled, never spoke, save under rare provocation, and then only to utter the same simple sentence, "We don't be to know." We called her Aunt Polly; she was related to our grandfather, and for years his house had been her home. To my anxious inquiry about her, my mother said, "She is crazy."

As I grew older, and years passed on, I saw and heard much of this woman's remarkable madness. During a period of seven years she played this quiet role. She used only signs to express her desires, often displaying an ingenuity that was truly amusing. If sometimes, with a view to provoke her to speak, one made a feint of not understanding her sign, she would, after much patient trying, repeat her chosen expression, "Me don't be to know."

After seven years of quiet industry came a change of programme. Seven years jubilee followed instead. The idolized wheel was set aside. Silence no longer reigned supreme. Overflowing with life and spirit, Aunt Polly was a new person, made up of new material. She talked almost incessantly, day and night, her imagination supplying wonderful topics, to which her eloquence added a peculiar charm.

She was fond of visiting, and often made tours through the country calling on all and exhibiting a friendly interest in every one's affairs. At one place she found a rich old widower with two grown up daughters. Her sympathetic heart was at once enlisted in behalf of this companionless man and his motherless girls. A wife and mother were needed, and she resolved to fill the place, and persisted in entering upon her duties with all the dignity of a high-bred lady. The old gentleman absented himself from home for a few days, thinking she would soon tire of the new position. But she did not. She willingly stayed at home, giving orders on the big farm and carefully tending her children, just as any true wife and mother should have done, and much tact was called into exercise before she could be induced to leave. For a long time after, she called herself Mrs. K., and spoke of her daughters with much concern and affection.

Unlike many, I was glad to have her visit me. She exercised over me a kind of mesmeric influence that was truly enjoyable. I could sit for hours listening to her impossible stories; and to have her stroke my hair and pity my poor head, would send through my body a thrill of inexpressible delight.

Considered harmless, she was seldom deprived of her liberty, but came and went at will, keeping up a perfect round of pleasure and excitement throughout the seven years. And then, as naturally as the sun sets, she would step into her quiet self again, bring out the long-neglected wheel, and sit down for a seven years' rest—her countenance resuming the old sad look, and her tongue refusing to speak save only the old expression, "Me don't be to know." Thus, every seven years, this wonderful woman changed back and forth her manner of life.

She was, perhaps, about thirty years of age when, through some matrimonial trouble, her mind first became disturbed. She lived to the very old age of ninety years, her periodical changes continuing through sixty years with a regularity that passes comprehension. Surely no madness was ever more mysterious.

We cannot contemplate a diseased mind without a strange feeling of pity for the unfortunate possessor; and I often think there are more in this world deserving our pity than we are aware of. In fact, are we not all, more or less, in and out of our natural selves, according to circumstances?

A CHEERFUL LETTER.

BY BUSY BEE.

The Agriculturist comes to us freighted with interest, and with promise of even better things in the future. I placed the last year's Agriculturists on file before me, and read over the articles from the several correspondents, and found much both entertaining and instructive, and how much more may we look forward to during the present year?

"Snip" speaks of a farmer's wife who gets dinner in the middle of the day, and has a light tea about five o'clock. I have been doing so since last summer, and find it in every way more satisfactory.

I sometimes make what we call "minute pudding." I take a quart of milk—more or less, according to the size of my family—put in a little salt, and let it come to a boil; then set it off of the stove and stir in flour (I like Graham best) very fast until it is thick. I then make a sauce of butter, sugar, and an egg, all beaten up together, with a little flavoring of any kind preferred. We like it very much once in a while, and it is easily made.

"Aunt Polly" sends an invitation to the children. I wonder if she would not extend it to grown children, and tell us how to make pretty and useful household articles. Will she not invite persons to send descriptions of such things to her department, if the editor can give us the room? I suppose we should not expect everything in one paper, but I think this would be very nice. Just think how many pretty and useful things we could learn to make by next Christmas for our children and friends. I lately saw some little articles that pleased me very much. They were little brackets, made of perforated card board, hanging on the wall each side of the bureau. They were made in the shape of a horn of plenty, with lids fastended on the top to keep the dust out and hide that which was inside, and were to put the combings of hair and soiled ruffles, laces and colars in. I thought them very pretty and useful.

TO "M. E. T."

Ed. Agriculturist: I hope you will pardon a few remarks in answer to your correspondent "M. E. T." whose "Friendly Letters" are indeed what they purport to be, I feel to thank her for her words of sympathy, which invalids so well appreciate. But I would ask her if she is satisfied to endure pain and suffering without questioning the cause, or trying to regain health? While my eyes are now being opened to the new life—a life in accordance with God's (nature's) laws—in which there is health and strength if we obey, my soul yearns to spread the glad tidings, that others who are treading the path which leads to ill health, pain and misery, may take warning and retrace their steps ere it be too late. My hostess, teacher and guide encourages me in investigating and thinking upon these questions.

I wish "M. E. T." would tell us some

of her "mother's memories," for some of us big folks are only children grown big, with hearts and heads that enjoy the "Corner" as well as little folks, and I often wonder if it would not make us happier and better, to, if we all indulged more in the sports and joys of children.

RACHEL A. E.

Domestic.

Don't Take it to Heart.

There's many a trouble
Would break like a bubble,
And into the waters of Lethe depart,
Did not we rehearse it,
And tenderly nurse it,
And give it a permanent place in the heart.

There's many a sorrow
Would vanish to-morrow,
Were we not unwilling to furnish the wings;
So sadly intruding,
And quietly brooding,
It hatches out all sorts of horrible things.

How welcome the seeming
Of looks that are beaming,
Whether one's wealthy, or whether one's poor!
Eyes bright as a berry,
Cheeks red as a cherry,
The grasp and the curse and the heartache can cure.

Resolved to be merry,
All worry to ferry
Across the famed waters that bid us forget,
And no longer fearful,
But happy and cheerful
We feel life has much that's worth living for yet.

BY A NEW CONTRIBUTOR.

TO AGRICULTURIST: I am a farmer's wife, and have been a reader of your valuable paper two years, and I have gained a great deal of information through its columns. In the January number, a lady asks some one to tell her how to wash colored flannels without fading, shrinking, etc. I will give her my way: Make a strong soap suds with luke warm water. To each pail of water put in one tablespoonful of liquid ammonia. Prepare the water before putting the flannels into the tub. If necessary to take them through a second suds, add only half the quantity of ammonia the second time. Rinse through warm water.

I also have a good receipt for washing calicoes to prevent them from fading. If any of the lady readers would like the receipt, they can have it by asking through the AGRICULTURIST.

Will some one please tell me how to kill lice on goats? Ours are very lousy.

As one of your correspondents has asked how to do it, here is my receipt for making sweet pickled currants: Let the currants stand six hours in weak salt water, then drain through a colandar. When well drained, put into a stone jar. To every pound of currants, take one pound of sugar and a pint of cider vinegar, with spices to suit the taste. Put the sugar and vinegar over the stove and let come to a boil, then pour it over the currants boiling hot. Boil the juice once a day for three days. Peaches can be put up in the same way.

MRS. L. W.

FLORA wants to know if any of our lady readers can tell her how to remove tea and coffee stains from table-cloths; and we supplement the query by asking if chloride of lime will not do it.

Santa Clara County is to have a beautiful atlas. A competent corps of artists, writers, statisticians, surveyors, etc., are making rapid progress with the work. Many of the most prominent buildings and most important places will be elegantly lithographed. The whole work will be one of much value and interest.

Boys and Girls.

Over in the Meadow.

BY MRS. OLIVE A. WADSWORH.

[A Kindergarten play for twelve little boys, from "Songs for Our Darlings." The recitations should be single; the sounds and motions, such as winking, etc., given by the whole, in concert.]

First Boy—
Over in the meadow, in the sand in the sun,
Lived an old mother toad and her little toady one.
"Wink!" said the mother; "I wick," said the one.
So she winked and she blinked, in the sand, in the sun.

Second Boy—
Over in the meadow, where the stream runs blue,
Lived an old mother fish and her little fishes two.
"Swim!" said the mother; "We swim," said the two;
So they swam and they leaped where the stream runs blue.

Third Boy—
Over in a meadow, in a hole in the tree,
Lived a mother bluebird and her little birdies three.
"Sing!" said the mother: "We sing," said the three;
So they sang and were glad in the hole in the tree.

Fourth Boy—
Over in the meadow, in the reeds on the shore,
Lived a mother muskrat and her little ratties four.
"Dive!" said the mother; "We dive," said the four;
So they dived and they burrowed in the reeds on the shore.

Fifth Boy—
Over in the meadow, in the sunq bee-hive,
Lived a mother honey-bee and her little honeys five.
"Buzz!" said the mo her; "We buzz," said the five;
So they buzzed and they hummed in the sung bee-hive.

Sixth Boy—
Over in the meadow, in a nest built of sticks,
Lived a black mother crow and her little crows six.
"Caw!" said the mother; "We caw," said the six;
So they cawed and they called in the nest built of sticks.

Seventh Boy—
Over in the meadow, where the grass is so even,
Lived a gay mother cricket and her little crickets seven.
"Chirp!" said the mother; "We chirp," said the seven;
So they chirped cheery notes in the grass soft and even.

Eighth Boy—
Over in the meadow, by the old mossy gate,
Lived a brown mother lizard and her little lizards eight.
"Bask!" said the mother; "We bask," said the eight;
So they basked in the sun by the old mossy gate.

Ninth Boy—
Over in the meadow, where the clear pools shine
Lived a green mother frog and her little froggies nine.
"Croak!" said the mother; "We croak," said the nine.
So they croaked and they splashed where the clear pools shine.

Tenth Boy—
Over in the meadow, in a sly little den,
Lived a gray mother spider and her little spiders ten.
"Spin!" said the mother; "We spin," said the ten;
So they spun lace webs in their sly little den.

Eleventh Boy—
Over in the meadow, in the soft summer even,
Lived a mother fire-fly and her little flies eleven.
"Shine!" said the mother; "We shine," said the eleven;
So they shone like stars in the soft summer even.

Twelfth Boy—
Over in the meadow, where the men dig and delve,
Lived a wise mother ant and her little antics twelve.
"Toil!" said the mother: "We toil," said the twelve;
So they toiled and were wise where the men dig and delve.

"OUR CORNER."

A HAPPY greeting, nephews and nieces! Here is something for us to puzzle our brains over, and I am not sure but it is a point well worth discussing. Amanda puts the question as follows:

SANTA CRUZ, March, 1876.

Dear Aunt Polly: Feeling interested in the plan which you suggest for mutual improvement, I venture to send, as an answer to your puzzle, the following, suggested by a friend at my elbow: It is what we often find in the form of a roll with fire at one end and a fool at the other. My friend, you see, is very outspoken, and a little prejudiced against anything which you, dear Aunt Polly, would hope the young cousins will have nothing to do with.

Jerry has been a good deal exercised of late about a matter which presses sorely upon his conscience, and I have resolved to lay it before you for advice and comment. The "Good Book" tells us decidedly, among the commandments, "Thou shalt not kill." It does not add what; therefore, should not the commandment be construed to kill not at all—neither bird nor beast? Food we have in abundance of a variety of sorts without taking life, still, to many of earth's inhabitants, animal food has become a necessity. Jerry has a passion for hunting. Game is shy and unapproachable. He has been tempted to shoot robins and larks, and has received numberless rebukes from the bird defenders. Jerry asks if life is not as dear to every living creature as to each little bird, and what difference whether one is born a robin or a jack rabbit; is it more of a crime to take the life of one than the other?

Sincerely, yours, AMANDA.

Aunt Polly will only say that if you will look a little farther into the "Good Book" you will find other commands which involve the taking of animal life, both for food and other purposes, and still others that provide for the punishment of those who take human life; so I think that settles the question as to *what* we are not to kill. However, killing any animals for sport is cruel and wrong.

Here is a new correspondent. How do you do, Willie. Glad to shake hands with you:

CENTERVILLE, March, 1876.

Aunt Polly: I am nearly twelve years old, but not too old to write to you. The answer to Jennie's puzzle is "Air." I have one which I think is still more difficult. Here it is:

I am composed of 16 letters.
My 7, 5, 2, 6, 8 is a large man.
My 8, 9, 15 is a weight.
My 8, 11, 10 is a metal.
My 12, 2, 8 is a small animal.
My 3, 2, 3, 4 is an article of ornament.
My 1, 14, 16 is what old people sometimes wear.
My 13 is a consonant.
My whole is the name of an American author.

Please put this in your journal.

WILLIE A.

Jennie brings another puzzle for you. I wonder if she will be as successful in solving Willie's enigma as he was in guessing hers. Do not allow yourself to be beaten by a boy, Jennie.

LIVERMORE, March, 1876.

Dear Aunt Polly: I have written once, and do not know that I ought to write again, but I thought I would send the answer to the enigma somebody sent you. It is the letter "O." I got thirteen separate words from the word "carpets." Here is a riddle that is not new, but perhaps some of the "cousins" have never seen it, and for me it was very hard:

There is a thing in many lands
Teaches multitudes but nothing understands.
It is not in Italy, but in Rome it doth appear;
It comes in every moment, but not in twenty year;
It's in all kinds of timber, but not in any tree;
It's in all kinds of mountains, but not in land or sea.

I remain, your niece, JENNIE D.

You did very well to get thirteen words from "carpets," but you are beat, for here comes another little niece, only ten years old, who has done still better:

LIVERMORE, March, 1876.

Dear Aunt Polly: My papa takes the AGRICULTURIST, and when it comes I always turn to the children's "corner." I like puzzles very much. I tried to see how many words I could make out of "carpets," and succeeded in getting one hundred and sixty-five, which I send you. [Will give the words another time.—Aunt Polly.] I think the answer to Jennie's rebus is "air." As this is my first letter to you, I will make it short.

Lovingly, your little niece,

MARY C.

Aunt Polly thinks there are still more words that can be found by using the letters as many times as you please. To the little girl or boy who will send us the most Aunt Polly will send the pair of chromos, "Chicks" and "Birds." Now all try real hard, won't you? And now hear what Georgie has to say:

SAN JOSE, March, 1867.

Dear Aunt Polly: Every night my mamma reads to me and my little brother after we go to bed, and it is a real nice way to do, because it makes us sleepy, and we dream of stories and things. I like the children's "corner" ever so much, and hope lots of girls and boys will write to you, and I wish the big ones would tell us something funny, too. Mamma read me what "M. E. T." said about telling us some funny stories, if they would let her, and I want you to be sure and ask her to, right away.

Your niece, GEORGIE.

LIVERMORE, March, 1876.

Aunt Polly: In looking over the children's "corner" of the AGRICULTURIST I found the enigma, and think I can solve it. It must be the letter "O." I have written an enigma, which I send you. If you think it worthy of a place in your columns I should be glad to see it published.

I am composed of 42 letters.
My 11, 2, 7, 26, 29, 41, 20, 35 is an animal of the hog kind.
My 18, 33, 10 is a weight.
My 15, 24, 32 is a domestic animal.
My 36, 38, 25, 39 is a the month.
My 26, 10, 8, 12, 30, 39 is peril.
My 1, 6, 13, 39, 2, 42 is an inclosure.
My 36, 19, 14, 31, 30 is the sap of a fruit.
My 22, 23, 28, 27 is quiet.
My 17, 4, 5, 32 is to raise.
My 31, 16, 21, 23 is to fit.
My 37, 9, 27 is a kind of fluid.
My whole is something that we always welcome.

Yours, TOMMY CLARK.

Now here is a little anecdote you will like:

A child went with her mother to buy shoes, and was shown some congress boots with a row of buttons up the side in imitation of buttoned-boots. She declined trying them on, and when mamma insisted, she declared they were only make-believe buttoned-shoes, and she did not want to wear anything that was a sham. "Please let me try a plain

pair, sir." The child was humored and the mother and shop-keeper both taught a lesson that it would be well for all to keep in mind—to avoid pretending to be different from what you are.

And now, good-bye all, and be sure and see that "Our Corner" is full next month. Every month we want some puzzle that will be worth a pair of chromos to beat.

GRANDMA'S TALKS.

Easy Lessons from Nature--No. 3.

Well, children, how many of you are ready to tell what will change ice to water, or to steam? Johnny says if he warms the ice it turns into water, then when the water gets hot enough it turns into steam. Now this is a fact worth knowing and remembering, that *heat* is the cause of *all the changes* of matter from the solid to the fluid condition.

After a shower do you see any of that kind of work done by the sun? It rained last night, and Johnny and Lucy a looking eagerly out of the window to see—what? That steam or vapor is rising from the roof of the barn. Look sharp, children, and you will see vapors rising from the ground, fences, houses and lake, as if hurrying up to make more clouds, which will fall to the earth again in rain.

Lucy asks what stops the steam up in the air—why it don't go clear up to the stars and never come down again. Johnny calls her a "goosie" to ask such a question. But can you answer her, master Johnny? Then you want to know the reason, too, don't you?

Breathe on the window glass, Lucy, and what is the result? Oh! you cannot see through the glass; you have made a tiny cloud there. You may laugh, but it is a real cloud. Now breathe ten or twelve times in the same place. You see the little cloud is beginning to rain. At first the drops were so very small they scarcely appeared to be water, but by adding more steam or breath they have increased in size until too heavy to stick to the glass and are falling like rain.

If heat causes water to change into steam, what happens when heat is taken out of the steam? Johnny says truly that it will turn into water again. What changes your breath (which is vapor or steam) into water on the window pane? That is right, Lucy. Feel if the glass is cold. You have found out the reason, now. And if we took a great deal more heat out of those drops, what then? They would turn to snow or ice. That is Jack Frost's work on the window panes in freezing weather. Perhaps you have never seen his beautiful work in this mild climate.

I must tell you now that even in countries where the weather is always excessive warm the tops of the highest mountains are covered with snow; also, that the people who travel in balloons always notice that the air grows colder as they rise higher and higher (for balloons frequently sail into and through the clouds).

Now, children, what stops any vapor or steam from rising and turns it back to the earth in rain? You are right, little Lucy. The cold air stops it, for that takes the heat out of the steam, which forms into clouds of tiny drops of water, falling in rain when they become heavy enough. And now Johnny will not call you a "goosie,' so readily again, I think.

Thus, you understand that the atoms composing water are not destroyed, but are continually taking one of the three forms we have mentioned: solid, liquid, or vapor. For instance, fresh falling rain is formrd of the water-atoms which have fallen over and over again; for since the creation of the earth not an atom has been destroyed of any kind of matter.

Lucy says Bridget has certainly destroyed her dolly's hat, for she threw it in the fire and it is gone entirely. Not so, Lucy; the form only is changed. You can't fit it on your dolly now, I know. It has certainly lost its fashionable shape and all its beauty as a hat; but every atom still exists, and perhaps takes more space than it did before, only your little eyes can't see it. In the bright flame it vanished from your sight, turning into smoke or gas, leaving only a few ashes visible.

Here I have a little toy called "Pharaoh's serpent's egg." It is no larger than a white bean. I light it carefully with a match. See it burn! Children, dont think it is really growing into a live snake, though it looks very much like one as. fold after fold, it wriggles out of the burning egg. That is only the ashes you see forming, and some portion of that little egg has also passed off in smoke.

I suppose you consider smoke "nothing," but you really have seen something, Johnny and Lucy, that increases in size by burning. The ashes are formed by a new combination of the atoms in the egg and the atoms in the air, caused by applying heat.

Our lesson to-day has been about a property, belonging alike to all matter, which philosophers call *indestructibility*. Lucy says it is too long a word for such a little girl to remember, but as it has only seven syllables, by taking two syllables a week I think you can learn it well during the month.

Correspondence.

A POLITICAL ENIGMA SOLVED.

BY UNCLE SAM.

Dear Editor: An article in a San Francisco paper accounting for the present hard times by the fact that our taxes exceed our exports, suggests to me a few thoughts that possibly you may find room for.

A heavy tax is not necessarily detrimental to the prosperity of the country. If the money raised by taxation is promptly and evenly distributed among the people, and in such a manner as to help the work of the country, it may be a great benefit.

I have a force of men working my ranch, and tax them ten dollars each for a "Hail Columbia" fund. It looks like a heavy tax; but if I pay each man a dollar every time he whistles or sings "Hail Columbia" the men soon have the money in their pockets, and the place is benefitted by the cheery influence and patriotic suggestions of that good, old tune. Should I insist upon a stave of "Dixie Land" being sung or whistled *before* each bar of "Hail Columbia," my men will probably discuss, quarrel, and raise more discords than there are in both tunes kept apart, and my "Hail Columbia" fund will come to grief.

It is better that Congress should refuse to vote a Centennial fund, than to force "Hail Columbia" and "Dixie" on the same platform.

Should I pay the "Hail Columbia" fund to a band of Chinese musicians, and thus send it nearly unbroken across the Pacific, my men would feel the discord of the transaction, and there would be less money to carry on business on the place.

Should I give it to any one man in such a shape that he could hire my men at increased wages to build some ornamental work that would return no equivalent to the country, both ranch and men would eventually suffer a loss, as during this absence my ranch has not prospered, and where the ranch or country goes down hill, the workmen follow.

Some of my men on the south side of the ranch got dissatisfied, jumped the ranch, stole the stock and tools, and elected another boss. I was obliged to detail a part of the workmen from the north side to stop these irregular proceedings, and so much labor being withdrawn from producing, I had to borrow money and issue notes.

This being so easily done, I pay my faithful men large wages, and they go into many enterprises on their own hook. They grade a railroad across the middle of the ranch, *and make me responsible for most of the work.* They spend vast sums of money, and withdraw much labor from production, on a railroad at the northwest corner of the ranch that, at present, is dead capital. They have erected a great many very costly buildings all over the ranch, most of them good to have, but will not pay this generation for building. Up the stream from one camp called New York City, they have built summer camps and laid out pleasure grounds that have cost millions of dollars, but return but very few dollars for the mass of the people to live on. Plenty of my promises-to-pay circulating among the men stimulated trade most unnaturally. Stimulated trade fairly intoxicated manufacture, and my ranch is piled up in places with boots, shoes, woolen and cotton goods, wagons, plows, etc., begging for a market, while those that made them are begging for employment, and those who need them have no money to buy them.

My dissatisfied workmen on the south side, I am glad to employ to build up the country they have so badly damaged. But if they insist on my *sliding along* to let their whipped boss draw his stool up to my desk, handle half the money, and make half or more of the laws, I must firmly say, No. I had rather he would keep out of sight or emigrate.

I would say to my men, north, south, east and west, be industrious and work at such work as will pay; don't fool away your time at fancy work for a few years, and we will pull through all right. I have been learning a good lesson watching my good friend Johnny Crapaud, who has a ranch over east of the big pond, and who so kindly lent me a helping hand nearly a hundred years ago, when I had a little difficulty with my mother. Johnny has had a rough lesson to recite, but his boys have taken hold with such good grit, and used so much economy, and paid their bills so promptly, that it is more than an even chance that they will, morally, be victors over their physical victors.

LETTER FROM CASTROVILLE, MONTEREY, COUNTY.

Deep-Plowing Controverted.

Ed. Agriculturist: I have noticed articles on deep and shallow plowing in late numbers of the Agriculturist. During an experience of nine years farming in California, I am convinced that thorough surface cultivation is the best. Good crops do not depend upon deep plowing in dry years, and in wet seasons they do as well upon shallow as upon deeply plowed land.

Where the soil is shallow, as upon poor hill land, it will not do to plow deep, as the only good soil is on top, where it belongs; to turn it under and bring up coarse material ruins it. Early seeding, as a rule, works best, and is better than all theories about deep plowing.

I have plowed my ground deeply after rains, when I could, and the light plowed, early sown has always yielded the best. The soil is lighter, finer and better for the germination of the seed when worked shallow and thoroughly.

In 1870-71 I plowed both deep and shallow, and I saw the wheat on the deep plowed soil dry out, while on the shallow worked it made a good crop. My neighbors have experienced the same. On the deep plowing the grain was slower in getting a start, and as the plowed soil dried out the roots perished, while on the lightly tilled they reached for moisture sooner and grew right along.

A gentleman in Pajaro valley plowed deep and sub-soiled with a small plow following the large one. In sandy sediment the plows ran very deep, and in other places a poor sub-soil was stirred up. He did not get as good grain from his deeply plowed land as from that which was lightly worked on the surface alone.

Potatoes and beans need deeper plowed soil than grain, but not too deep, either, but thoroughly working of the soil. I have tried it during the last nine years with potatoes, barley, wheat and oats. A good, early start is the best for all grain crops, and in all seasons, wet or dry, I find deep plowing not so good as thorough surface tillage, not over three or four inches.

It is not safe to plow adobe land over five or six inches, and it takes a good deal of extra power to do it. Your correspondent, "Mechanic," who speaks of plowing fourteen inches, must be in error. This rainy season it may do to plow some classes of soil deep, such as black adobe on clay sub-soil. Such soil is the best and most enduring grain land in the world.

The farmers in Europe do not get their best crops from real deep plowing, but from heavy manuring and working into the soil ingredients to make it light, rotation of crops, changing to green crops and pasture, etc., two plowings a year, careful harrowing, and fine tillage generally. As they have small farms, and naturally a shallow soil, it has paid them to deepen it artificially, underdrain it, and renew its fertility with manures, plowing under green crops, etc. They have a sod to turn under, rains every month in the year, and must farm differently.

Here, before the heavy fall rains, we cannot plow deep—and if we do, we get no better crops. But with shallow cultivation we can get in our crops early, and in better condition than at any other time. And if not drowned out, we get the best crops.

On rich land the only danger is that the grain will grow too rank and lodge.

TREADWELL SINGLE-GEAR CALIFORNIA HEADER.

We give an illustration of this header, believing it to be a superior machine. It is manufactured expressly for California grain fields, by J. I. Case & Co., of Wisconsin, the largest agricultural machine manufacturers in the country. Besides retaining all the improvements of value used in the Haines headers, it has the patent adjustable reel, improved iron wheels, new flange guide wheels, improved pitman and boxes, improved elevator, improved bevel gearing to drive the reel, and pipe-shaft for reel. The strain is equalized with truss braces. No unnecessary friction; easy to turn; thrown in or out of gear while in motion; was gotten up in California by practical mechanics and farmers, for California, and is manufactured out of the very best materials for good and lasting service.

The proprietors of Elevator A, at Indianapolis, offer to transfer grain, and store the same for 20 days at ¼c per bushel, and no charge for shoveling or switching. The charges in Chicago are nearly 3c on wheat and corn.

GOOD BLACK INK.—A gentleman away out in Idaho says: "Good black ink is not easily attainable here, and the trash that passes for the genuine article is sold at fabulous prices." For his benefit and that of others similarly situated we repeat a recipe taken from the New York *Tribune:* To one quart of strong decoction of logwood, well strained, add three ounces of blue galls in coarse powder, twelve drams sulphate of iron, one and one quarter drams acetate of copper, twelve drams of well ground sugar, one and one-half ounces of gum arabic. Set it over the fire till it begins to boil, then set it away uncorked till it has turned black enough; add a few cloves to keep out the mold. It is a real pleasure to open a letter and find a clear, legible chirography, in ink of a decided color, as well as less of a task to write one with smoothly flowing ink.

STRAW AND HAY.—Good clean straw, carefully stacked, is supposed to represent a value in comparison with the best meadow hay, of three to one. That is, an animal must eat three pounds of straw to get the same subsistence as would be afforded by one pound of hay.

One of our exchanges mentions the fact that a person had trouble with the drawing out of staples from barn-doors, and screws from hinges. He drove pegs into the holes, and put the irons in again; but they would soon come out, wooden pegs and all. Then he used leather, which was better than wooden pegs, but in time the latter got used to the pressure, and let the staple out. Then he filled the holes tightly with cork, and put in the screws and irons, and they have remained in perfect condition to this day.

TO PRESERVE FENCE POSTS.—According to excellent authority, fence posts can be made as imperishable as iron for less than two cents apiece. Pulverized charcoal is to be stirred into boiled linseed oil to the consistency of paint, and a coat of this is to be brushed over the part of the post to be placed in the ground.—*Boston Journal of Chemistry.*

BE frugal, but not mean; prudent, not subtle: complaisant, not servile: active in business, but not its slave. There are also four other habits which are essentially necessary to the happy management of temporal concerns: punctuality, accuracy, steadiness and dispatch.

Vinsonhaler's
Business College!
SAN JOSE, CAL.

Thorough instruction in all branches pertaining to a business education.

No scholar graduated who falls below 98 per cent. in Studies and Deportment.

School in session during the entire year.

Pupils can enter at *any time.*

Those desiring Board can find a comfortable Home in the Institute.

All Graduates will be awarded a handsome Diploma.

Pupils attending this College can also have access to any of the English branches taught in the SAN JOSE INSTITUTE *free of charge.*

AND BUILDERS' HARDWARE,
ALSO ...
IRON, STEEL, COAL, ETC., ETC.

Comfortable Combination Clothing.

THIS STYLE OF UNDERCLOTHING FOR Ladies has been found by all who have used it, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying at the San Jose agency, **California Agriculturist Office,** (where samples can be seen,) or by addressing

C. C. C. Company,
Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. It is the invention of a California lady who makes every pattern her-elf and writes full directions upon each. No family that once tries this style of clothing will ever go back to the others.

DR. C. R. SPAW,
Resident Dentist,
Corner of First and Santa Clara streets, In McLaughlin & Ryland's building, San Jose, Cal.

SAN JOSE INSTITUTE
—AND—
BUSINESS COLLEGE!
A Day and Boarding School for Both Sexes.

THE SECOND SESSION OF THE CURRENT School Year will commence January 3d, 1876.

In acknowledging the kindness of the patrons of this School, the Proprietors desire to assure them that with the increased patronage will be added increased facilities for imparting instruction. They intend that the School shall offer the very best opportunities for acquiring thorough education, both theoretical and practical.

The course of study in the Academic grade is extensive and thorough.

The Business College has no vacations.

Students from a distance will find pleasant rooms and board at reasonable prices at the boarding-house.

The Faculty accept to its fullest extent the growing demand of the industrial classes for recognition in the public educational system hailing it as the harbinger of a higher and better civilization.

ISAAC KINLEY,
Superintendent of the Institute
JAMES VINSONHALER,
Principal of the Business College.

PROCLAMATION.
Chicago & Northwestern Railway.

Is the popular route overland to the East.

Passengers for Chicago Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their trans-continental tickets via the pioneer route,

THE CHICAGO & NORTHWESTERN R.R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fortwayne and Chicago and Pennsylvania Railways.

❍ Through trains daily, with Pullman Palace ❍ Cars through to Philadelphia and New York on each train.

THROUGH TRAIN, WITH PULLMAN PALACE Cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (New York Central and Erie Railways):

❍ THROUGH TRAINS DAILY WITH PALACE ❍ Drawing Room and Silver Palace Sleeping cars through to New York.

By the Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways:

❍ Through trains, with Pullman Palace Draw- ❍ ing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

By the Baltimore and Ohio Railroad:

❍ Through trains daily, with Pullman Palace ❍ Cars for Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace sleeping cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, Council Bluffs and Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through cars to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, No. 3 Fremonto, and in all the Ticket Offices of the Central Pacific Railroad.

The Cal. Agriculturist Pub. Co. have constituted themselves a **Purchasing Agency**, to accommodate Agriculturist subscribers. Anything wanted in San Jose or San Francisco purchased at lowest rates for cash, and forwarded to order **Free of Commission.**

THE CAL. AGRICULTURIST PUB. CO.

ANNOUNCE TO SUBSCRIBERS OF THE "AGRICULTURIST" that they have made arrangements whereby they can supply almost any desirable book published upon any subject, at publishers' prices, postpaid, upon receipt of its price. People living in the country, away from book stores, have experienced difficulty in getting what books they want at any price, and are frequently imposed upon when they do get books. Now, we propose to remedy this matter entirely, and without further trouble to our patrons than the sending of their orders, accompanied with the cash, to select the book they want, and send it to them at publishers' own price, free of other costs. Our arrangements are fully perfected, and we mean business! We shall continue our Catalogue of good books from time to time, adding the most desirable books published.

IMPORTANT TO SUBSCRIBERS.

We have made further arrangements so that we can offer PREMIUMS OR BOOKS for every prepaid subscription, to old and new subscribers alike; and to every person who solicits subscriptions we give extra premiums of his own choosing. Our premium rates are as follows: Upon each $1.50 subscription, prepaid for 1876, we credit to account of subscriber 50 cents reckoned in his favor upon an order for books to the amount of $2. In other words, after paying for 1876, upon receiving an order for any book or books at any time worth $2, only $1.50 in coin need be sent. This, added to the 50 cents to his credit, will pay for the books. Persons who, at the time of paying their subscriptions do not order books, or who order but a part of what they want at once, will be entitled to the benefits of OUR PREMIUMS AND REDUCTIONS whenever they choose to take advantage of it, at any time during the continuance of their Subscriptions.

TO SOLICITORS.

The agent sending us four subscriptions with $6 (the bare subscription price), will be entitled to $2 worth of books, his own choice, without further remittance. This gives every young man or woman a chance to get all the reading they want WITHOUT COST, and to the subscriber a chance to get books BELOW COST. We are sure that no better opportunity was ever offered to the public on this coast to obtain good reading. The AGRICULTURIST, greatly improved for 1876, will be worth more than the subscription price, which is within the reach of every one's means, and our arrangements of giving premiums is such as to be sure to please and satisfy everybody, whether young or old, rich or poor. We are determined that the AGRICULTURIST shall reach every home on the Pacific Slope, and while we propose to be liberal towards all of our subscribers, we hope to be favored by the efforts and good will of each and every reader of good books, and of the CALIFORNIA AGRICULTURIST.

If you ever intend buying a WIND MILL, examine the record of the solid-wheel ECLIPSE, tested 8 years; 3500 in operation—IMPROVED Hand or Wind-mill Force Pumps; Second-hand STEAM Machinery; CHEAP. Write me for circulars, or call. CHAS. P. HOAG, 118 Beale St., San Francisco.

SUPERIOR FARM WAGONS

Mr. John Balbach has just received from the manufactory a whole carload of the well-known and favorite Fish Bros. Wagons. Every wagon is warranted to be made throughout of the very best select seasoned lumber. The wheels are re-seasoned in boiling oil, and the whole wagon is constructed in a thorough, workman-like manner.

The Carriage Manufactory connected with Mr. Balbach's shop, under the supervision of Mr. Crydenwise, is also turning out very superior Buggies and Express Wagons, mostly built to order. Don't fail to see what they can do if you want anything in their line.

Suitable for Threshing, etc.

Call and see one in operation in the Foundry Yard, or send for circulars if you want further particulars.

☞ The Superiority of these Powers is too well known to call for comment.

DuBois'
MOWER ATTACHMENT.

This is an attachment which enables the farmer, in all kinds of mowing, to cut his grass without any aid whatever behind the mower. A sweeping, curved arm guides the grass or grain in front of the cutter-bar in such a manner that when mowed the swath has the appearance of being cut with a grain cradle, the heads all lying away from the standing grass or grain about 12 inches in the clear. To facilitate the operation, an ingenious attachment is made fast to the end of the cutter-bar, in place of the shoe usually used with mowers. In lodged grass or grain, and when the wind blows contrary to the lay of the swath, these Attachments work like a charm, having the cut swath lying just as desired. The Attachment can be fitted to any mower.

Mr. DuBois has now made arrangements to fill all orders. The cost of the Attachment will range from $12 to $15—the price varying with the expense of fitting to different mowers.

Address:
ORIN DuBOIS, San Jose.
Or call at the shop of Scott & Watkins, on the Alameda, San Jose.

The Editor of this paper has witnessed the action of this Attachment in the field, and can cheerfully endorse the above statement as being substantially correct. It is certainly a valuable aid in all kinds of difficult mowing. my

ENRIGHT'S PATENT PORTABLE WOOD AND STRAW BURNER.

Mr. Enright, of San Jose, the inventor of the thresher engine of which we present an illustration on this page, has studied the wants of California farmers for many years, and has now succeeded in producing an engine that at once commends itself for practical use. The arrangement for burning straw is far superior to that of other engines, preventing any choking up of flues and at the same time, by admiting a larger supply of air, forming complete combustion. The economy of thus utilizing the straw that many farmers burn simply to get rid of it is apparent. For practical use, we believe this engine to be a worthy and successful invention. Following is a card from Mr. Enright in which he sets forth his claims:

Fifteen years ago I constructed the first portable thresher engine on the Pacific coast, and its introduction in the harvest field was an important event in the history of grain raising in California. From that event up to this time, I have been constrantly experimenting and improving on my original ideas of steam threshing in the open field, until I have now constructed an engine and boiler so near perfection that is is barely possible to be improved upon.

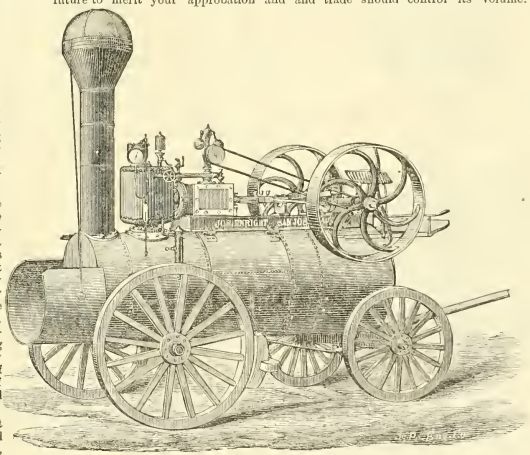
Having for so many years made it a specialty to construct portable thresher engines, I can with confidence recommend my patent wood and straw burning engines manuiactured by me at the present time. They burn wood or straw without change, and coal by changing two plates; they have also the advantage of compactness, superior workmanship, great durability and economy in saving fuel, using but two tons of straw to equal one and a half cords of wood, and saving 40 per cent. of fuel usually consumed by wood burners.

It is a well-known fact that straw has been successfully used as a fuel to raise steam, in Europe, for many years, and it has been lately introduced on this coast, but with little success until I invented for that purpose my "patent ring grate and combustion chamber," which prevents any choking up of flues, and by which I am enabled to admit a larger supply of air, thereby forming complete combustion and doing away with all delays on the field.

I built and sold thirteen of them last season, all of which gave entire satisfaction, which is proved by the many testimonials received from those using them.

I am now busy constructing twenty more for this season and intend to have them all ready for use this present harvest; I also intend to make it to the interest of all farmers to purchase of me, who need a cheap and economical power for threshing. I come before you with this power, with full assurance of your patronage, having considered your needs in this very essential invention. I have had an offer from parties in San Francisco and Sacramento to have my engine built in the East on royalty, which offer I declined, although it may have been to my advantage to do so; I preferred to be sustained by the people of California in home manufacture, and I come before you with an engine that is guaranteed to you in every respect, and which took the premium at the California State fair of 1875, as the best straw burner. And I further state that I hold myself in readiness to reinforce any of my customers; all that is necessary for them to do, is to send me a telegram and I will be at their service.

Thankful for past patronage, and by strict attention to business, I hope in the future to merit your approbation and continued patronage.



ENRIGHT'S PATENT WOOD AND STRAW BURNING ENGINE.

Further information can be had concerning these engines by addressing Mr Joseph Enright, San Jose, Santa Clara county, California.

The Virginia *Chronicle* says: Virginia City has given birth to a genuine sensation—a mule colt. It has been thought that the limits of cross-breeding had been reached with the mule production, and only two instances have been recorded of the further reproduction of the mule genus. Virginia now furnishes a third. The colt resembles a mule in every respect, but is much smaller and more delicate. It is the property of J. S. Hardwick, who has been offered $300 for it by J. Douglas, which he refused.

FINANCIAL FOUNDATION.

The annual interest on the foreign indebtedness of France is said to be more than the entire product of all the gold mines of the world! Then how contemptible does the idea seem that gold is the *true basis of all values*. There is nothing of much value produced without human industry. And inasmuch as industry supplies about all the wealth of the world, *why not base values upon industry?* There can be no gauge more accurate, or nearer in accordance with reliable, simple, and natural principles. Industry must be the support of a perfect financial system, and such a system must be predicated upon industrial values. Therefore, industry should establish the relative values of denominational currency, and the demands of industry and trade should control its volume. Money or currency should be the servant, not the master of man. It is not at all necessary that money should contain intrinsic value in itself. Its only use is to represent values and be exchangable for value. If properly grounded in and upon the actual productive industry and substantial honor of a people or nation issuing the same, it may be unexceptionally exchangable for any and all valuable commodities without discount. Interests may be brought so low as to unburden our people from that source of taxation. The Government may regulate interest rates by *loaning*, instead of *hiring* money. An industrial people never can, and never should be satisfied with a vacilating money, whether paper, silver or gold. Something reliable, cheap and abundant is demanded by the people. And the people are ready to pledge their property and their lives to substantiate a currency that shall serve them with the least expense and most utility.

BENTLEY'S FURNACE AND DRYER.

Last month we briefly mentioned Dr. Bentley's furnace and fruit-dryer. We expected to have a cut to illustrate a description, but it is not ready. The furnace is simply a plain, barrel-shaped fire box surrounding a smaller barrel which is supplied with air by tubes connecting with the air ont-side of the furnace, and with a discharge upon the top for its escape. Another cylinder surrounds the whole to take up all the heat radiated outward, and together with the hot air from the interior barrel conduct it by a tube, or directly, into the dryer. The smoke from the fuel, after being deprived of its occompanying heat, is carried off through a separate pipe. The construction of the furnace is such as to most economically utilize the heat of the fuel, as there is a very large radiating surface to absorb it before the smoke can escape.

The dryer is shaped like a long box, and is placed horizontally upon legs about three feet from the ground. Inside are several sets of rollers above each other, at each end, with endless bands, running longitwise, upon which screens with the prepared fruit for drying are placed. The fruit screens are put in at one end and taken out at the other, or at the same end, and a crank is used to run the screens in the direction desired.

The heated air is to be applied at the top of the dryer, and is either forced or drawn downward, reversing the methods heretofore used by other dryers. In this arrangement, we think, Dr. Bentley has struck upon the right principle. The heat can be entirely utilized in this way. After the hot air is used for drying, it can be further used for feeding the furnace fires, or may be conducted again into the heater, or be expelled, as susts the purposes of the person in charge.

Altogether, for simplicity, economy, and philosophical principles of construction, this dryer strikes us as being nearer the thing than any ever gotten up, whether on a large or small scale. No engine or blower is necessary with this dryer, as the air drawn into the heater will be expelled with sufficient force to operate as desired without other power. It is a perfect thing in itself, and within the reach of all. Dr. Bentley will manufacture three sizes of these furnaces and dryers, and can make them of any capacity desired. The cheapest furnace (small size) is $50; dryer to go with it, capable of drying ten to fifteen bushels of fruit per day easy, $25 more, making only $75 for a complete outfit for a small orchard. No large commissions are counted against the purchaser in these figures.

Chip hats ought to suit blockheads.

California AGRICULTURIST AND Live Stock Journal.

$1.50 Per Annum.

PUBLISHED MONTHLY BY THE

CAL. AGRICULTURIST PUB. CO.

S. HARRIS HERRING, Editor.

OFFICE:—Over the San Jose Savings Bank, Balbach's Building, Santa Clara Street, near First, San Jose.

☞ We are determined to adhere to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

Notice to Eastern Advertisers and Advertising Agencies.

☞ Hereafter no proposition for advertising in this journal will be entertained without pay in advance. Our published rates are the standard for all.

EDITORIAL NOTES.

An excellent variety of contributions may be found in this month's issue. It takes all hands to make a good paper, and we never feel prouder than when we can send out a number filled with good articles from the pens of our worthy correspondents.

What can be done with the mining debris that is now filling the beds of rivers and causing the water to submerge farms and ruin them with a deposit of mud, is a question that the agricultural editor of the "Record Union" undertakes to solve. He would build dams in many places in the lower mountain ravines, and let the sediment make acres of level ground for cultivation. Also, by conducting it upon the low tule lands, would convert them into the richest alluvial farms. We judge these suggestions to be sound and practical.

Illustrated Temperance Lectures. Mrs. Carrie F. Young has been lecturing in San Jose and vicinity during the past month with excellent success. Although the subjects of temperance and health are old, and by many thought to be worn threadbare, Mrs. Young seems to be in such demand that every one who hears her once wants to again, and wants his friends to hear. Every school district has sent a call, and if Mrs. Young is not worn out before she gets away, maybe some outside of Santa Clara county will have the privilege of listening to her earnest and instructive talks to the people, for their good. Long may her voice be heard in the land!

Vineyards, upon rich, moist soils, will be likely to make an immense growth of wood this season and produce inferior fruit. Too much moisture in the soil is not favorable to the production of fine grapes. We advise letting the grass and weeds grow a while to absorb moisture from the ground. The grapes will be all the better for it. Better than this would be the raising of a crop of some kind of vegetables in the vineyard. To guard against mildew, which is bound to be prevalent this moist season, use sulphur freely. Put it on the blossoms and on the fruit as soon as fairly set, and even when half grown. A free use of sulphur in many localities will be absolutely necessary to insure good grapes.

The *Country Gentleman* publishes, in its editorial notes, the following:

A CALIFORNIA TRANSACTION.—Of course we should not publish the following statement if the name of the writer were not known to us: "Eds. 'Country Gentleman'—Some time during 1874, you published several letters from a correspondent in California who had a good deal to say about alfalfa. He stated in one of his letters that pure seed could be obtained from a Col. Warren, 320 Clay street, San Francisco. In January, 1875, I wrote a letter of inquiry to the Colonel, asking the best way of shipment for 50 pounds alfalfa seed. I received a reply signed Warren & Co., stating that for $12 in gold they would send me by mail, postage paid, 12 bags of four pounds each. I immediately mailed them a money order for the amount, and have not heard from Warren & Co. since. I wrote two letters, but got no reply, but they did not see fit to reply. I received a statement from the postmaster of San Francisco, that the order was presented by the firm mentioned, and paid.

"If Messrs. Warren & Co., will only return the amount of that money order, I won't write them another word about alfalfa, but invest it at once in red clover.—[P., Cleveland, Ohio."

And from another correspondent the following:

"To COME DOWN A PEG.—I have an account of another 'California transaction' to give you. Acting on the information concerning alfalfa referred to by your Cleveland (Ohio) correspondent, on page 103, January 12, 1875, I forwarded to Col. Warren, editor of the 'California Farmer,' a postoffice money order for $6, begging him to send me alfalfa seed by mail, according to the terms named by Mr. Armstrong, but in case the price had advanced, then to send the money's worth. Hearing nothing from Mr. Warren, February 21st I wrote him again. No answer being received, I wrote to make inquiries of Mr. Armstong. He replied promptly, informing me he had visited the 'Farmer' office in San Francisco; that they acknowledged the receipt of the money, asserted seed had been sent, but that by mistake a wrong address must have been made. However, they promised to send another package, and to compensate for the delay and error to add a valuable collection of Pacific Coast seeds. Meantime, I had ascertained from the San Francisco postmaster that the order had been paid on a date given, and from the postmaster of Champaign, Ill., that there was no other postoffice of that name in the territory of United States. But I have heard nothing of Col. Warren to this day. Before making this transaction public, I have waited for corroborative evidence, and in concluding my testimony beg to ask if such acts are not doubly infamous from the fact that they must inevitably annoy and embarrass an upright and honorable man?"

Several complaints of a like character, from persons in this State, have been made to us, by well known and responsible persons, and if California and the publishers of papers devoted to the high calling of the farmer, have got to rest under an obloquy from the villainous transactions of any one man or firm, it is about time to ventilate the matter. We should have published a few facts long ago, as an honest warning to the people, but for the advice of friends, who told us that our motives would be impugned, and we had better not dirty our fingers with the subject.

The elegant plant stand and bell-glass fernery which we illustrate this month is certainly a pretty ornament for a sitting-room, and the window bracket for a pot and hanging-basket is also. These can be found at Mr. Mitchell's flower store, San Jose.

Our readers will find Dr. Scott's article in this number very worthy of contemplative reading. "Old Mortality" went about with pious hammer and patient chisel and renewed on the tombs of the old Scotish Covenanters the names and dates that the ruthless tooth of Time had well nigh erased. It was a labor of love. He desired to renew the names and virtues of those old worthies to the living age. Would that some reforming "Mortality" would rise up now in our midst, and retouching the tablets of our hearts, once more deepen and bring out in bold relief the almost forgotten principles and precepts of the Fathers of the Republic. Dr. Scott's article arouses refreshing thoughts.

Rust is likely to attack wheat fields in our coast counties in seasons when there is much moisture, producing a rank, tender growth of straw. Morning fogs, which wet the growing grain and then clear up suddenly, exposing the still wet fields to a hot sun, also showers and sunshine immediately following, are favorable to the germination and growth of the fungus rust. As a preventive, a bushel of salt to the acre, sown upon the growing grain, is good. Two horsemen, one each side of a field, with a rope stretched between them, can sweep a field of dew and prevent the scalding from the hot sun which seems to produce the rust. As a general thing, when the rust once shows itself in a field, it is safe to cut the wheat for hay before it is entirely ruined.

Upon the Chinese Question, the people generally seem, at last, to have come to their senses. Since this journal took the field, we have steadily opposed Chinese immigration, believing it to be a curse nearly exactly parallel in its effects to the slavery that once existed in the South, and which we opposed in the field, under arms. At one time—before we were aware of the evils that were fostered by Chinese servitude—like many others, we only thought of the generous principle of our Government which invites all peoples from all nations to come and join us in our free institutions, and be free with us, and become a part of us. But when we found that Chinamen would never do this, that they were antagonistic to our principles; bringing their slavery here, and coming only to get and carry away our wealth; when we found that their cheap labor benefitted none but their masters and rich men and monopolists; was building class distinctions, degrading labor, and bolstering up aristocracy; that no man or woman can compete with them and live as respectable beings in a civilized country should live; that their very contact was contagion and degradation, without one hope of bettering affairs while they control any species of labor prices; that their labor system discourages individual enterprises, and that, instead of making the country any richer or better, or becoming freer themselves under our flag, they absorb our wealth, make the poor poorer, discourage the immigration of other nations and people as African slavery did, and are, in every sense, in opposition to general thrift and prosperity, peace and liberty and good will, we turned, as we now are, in favor of the best interests of our own race and civilization.

Jottings.

The way to help along an agricultural paper is to talk for it and write for it. Talk to your neighbors and friends; talk to farmers, fruit growers and stock breeders and others, and tell them of the value of a good agricultural paper. That is one way to help its circulation. But there is also another way, and an excellent way, and that is to write for it. As you are at work, or walking from field to field, thoughts will flash into your mind, that, if put into an agricultural paper, would be of great help to it. Retain those thoughts, and when you have a little leisure, jot them down with pen or pencil on paper, and send them to be published. Send them on postal cards, or in the form of a letter, or in any other way. Editors are always glad to get these jottings, They give variety to the matter and interest to the paper. Every reader could contribute something of benefit to somebody.—*Rural World.*

A DURABLE WHITEWASH.—A whitewash that will stand the exposure to weather to which it is subject on the lighthouse structures of the Atlantic coast will certainly prove good for use in covering fences and farm out-buildings in our climate, and those who have noticed the appearance of the lighthouse structures to which the Bureau recipe wash has been applied, consider it but little inferior to paint. The following is the direction furnished by the Department for preparing and applying this wash, which can of course be tinted to suit any taste by the use of ochre, umber, Spanish brown or other ingredients: Slake a half bushel of unslaked lime with boiling water, keeping it covered during the process. Strain it, and add a peck of salt dissolved in warm water, three pounds of ground rice put in boiling water and boiled to a thin paste; half a pound of Spanish whiting and a pound of clear glue dissolved in warm water; mix these well together and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace, and when used put it on as hot as possible, using either a painter's or a white-wash brush.

There is probably no article manufactured in the United States that has extorted so much money from the working people in exorbitant price as the sewing machine. For over twenty years there has been a powerful combination which monopolized and controlled the prices of all first-class machines. Nearly all patents on sewing machines have expired. Yet the old prices are firmly adhered to by the monopolizers who are not satisfied with the millions upon millions of dollars extorted from the poor people who are compelled to purchase a sewing machine to gain a livelihood. Particularly is this true in large cities, where the working girls are compelled to toil from morning to night to save and pay eighty dollars for a sewing machine, that should not in any event have cost more than forty and with a good manufacturing profit at that.

If used to be a gin mill, then a barroom, then bar, then saloon, then sample room, then exchange, then parlors; now it is a picture gallery. "Go around to the picture gallery, and take a drink of the best whisky in the world," says an advertisement. Very good. We expect to see a groggery call itself a minister, or a public library, or a home for the friendless, or an academy of sciences, before we die.

Read the advertisements and profit by them

Poetry.

Jasper Dean's Musings.

THE apples were red in the orchard, the meadows were sober and bare,
The woods were ablame with a splendor that glowed in the glorified air.

Through the valley a tremulous murmur ran drowsily all the day long,
Where a brook kissed the pebbles, and passed them and sang its perpetual song.

Leaning over the gate of his garden, the leaves all awhirl at his feet,
Jasper Dean mused, like one who was dreaming a dream far more bitter than sweet.

"I am fifty years old this October," he muttered, "and how do I stand?
Well, I own a smart house and two hundred good acres of tol'rable land.

"There's many a man would be happy with half what I've got to my name,
But I'm not; and I reckon most likely there's suthin' or other to blame.

"There's a feelin' that sometimes comes on me, and mostly at this time of year—
When the birds fly away, and the dimness gives notice that winter is near.

"There's a feelin' that sometimes comes on me and makes me half wish to be dead;
And I don't know exactly what brings to buzz like a bee in my head.

"It may be the changing o' the seasons, with death and decay all around;
Or it may be a wish growin' stronger for suthin' that ain't to be found.

"There is hardly a day but the neighbors are talking about my affairs;
I don' thank them for standin' my business; I'm sure I don't meddle with theirs.

"But they talk, and they talk, and the drift of it all about my dull life.
It is dull, I know that very well; but I'm now past the time for a wife.

"When a man touches fifty, like me, he had better be sayin' his prayers;
Not fretting himself about women and runnin' his head into snares.

"There was Absalom Brown, that went off and got married at most fifty-five.
If he hadn't done that, I don't doubt but the critter would still be alive.

"But the woman he took just worried his wits out in less than a year;
Though when he went off she was ready with many a crocodile tear.

"But all women are not o' that sort. There are plenty as good as can be;
And if I had married at thirty it might have been better for me.

"There's the house, and a good one it is—not a better the country can show;
But I never go in without feeling a dullness, instead of a glow.

"A home may seem ever so pleasant and ever so neat and fine,
And still have no comfort within it; and that's what's the matter with mine.

"There is never a voice to give welcome, and never a glad smile to greet,
And my heart never throbs to the musical patter of innocent feet.

"What's the use of a man always strivin'? He gains but a little at last;
And it generally comes, if at all, when the time to enjoy it is past.

"Now, if I had married at thirty, as I had a notion to do,
Who can tell but my heart would be lighter, the home a more pleasant one too?

"But somehow I waited and waited; and now I am fifty years old;
There is plenty of frost in my hair, and my blood has grown sluggish and cold.

"I feel more like restin' than workin', and every year that goes by
Fears to tell me I'd better be careful, and leaves me a trifle less spry.

"And suthin' comes on me in autumn—I don't know exackly what way—
That makes me feel sad-like and solemn, and sets all my ideas astray.

"It may be the change o' the seasons, with death and decay all around;
Or it may be a wishin' and longin' for suthin' that ain't to be found.

"A man without some one to care for is not as a man ought to be;
And a home without some one to cheer it ain't pleasant to have or to see.

"Now, if I had married at thirty—Phaw!" here I am drivellin' on,
Within lots o' things to be seen to, and the sun, as I live, a'most gone.

"There's a chill in the air about sundown, I reckon I'd better get round,
Or I'll have that old rheumatiz shootin' all thro' me again, I'll be bound."

An Horatian Lyric.

O, blest is he, from business free,
Like the merry men of old,
Who tills the land with his own stout hand,
And knows not the lust of gold.

No sailor he on the stormcy sea,
No soldier, trumpet stirred;
And he shuns the town and the haughty frown
Of the courtiers' fawning herd.

But he bids the vine with her tendrils twine,
Around the poplar tall;
And he adds a graft, with a gardner's craft,
To the tree that climbs his wall.

Or a grazier keen, on the pastures green,
He sees his oxen feed;
Or he shears his flock, or he brews a stock
Of his rustic nectar mead.

And when autumn at length, in his manly strength,
Has raised his fruit-crowned head,
And plucked the pear, with its flavor rare,
And the grape with its clusters red,

With his knee on the sod he blesses God
For his mercies and favors free;
And he lays him along, while he lists the song
Of the thrush in the old oak tree:

While the waters glide with the rippling tide,
And the zephers softly creep
O'er the quivering leaves, mids the murmuring trees,
And lull the senses to sleep.

But when thundering Jove from his stores above
Sends wintry storm and rain,
And rock and wood, and field and flood,
Lay bound in his icy chain,

With many a hound, in the woods around,
He hunts the grizzly boar;
And ere daylight fade his gleaming blade
Is red with the monster's gore.

When the sun has act he spreads his net,
And the partridge, fluttering, dies;
He takes the hare in his crafty snare,
And the crane—a goodly prize.

'Mid joys like these, what ill can tease—
Who could remember pain?
He feels no wrong, and laughs at the throng
Of the cares that swell love's train.

If a loving wife—best staff of life—
Be his, and children dear,
The fire borne bright, with ruddy light,
His homeward step to cheer.

At the cottage door, when his toil is o'er,
She stands with her smile so sweet;
And holds up her face, with a modest grace,
His welcome kiss to meet.

And children glad swarm round their dad,
But hungry the man must be;
So she spreads the cloth, and he sups his broth,
While she pours out refreshing tea.

—[Blackwood's Magazine.

Follow Up the Plow.

BY WILL S. HAYS.

Hard times are now upon us,
And the people are in debt;
The country's full of trouble
And the worst is coming yet,
'Tis not without its causes,
And we'll gladly tell you now,
The only way to stop it,
Is to "follow up the plow."

Fill up your fields and prairies
With a crop that's "good as gold,"
And mine your hills and valleys wide
For iron, salt and coal.
The earth is the producer,
And we can tell you how
To make a princely fortune—
'Tis to "follow up the plow."

There are too many people
Who from their duty shirk,
Who'd rather make a fortune
By some other means than work.
The man who plants tobacco,
Corn, wheat or cotton now,
Is king among the moneyed men,"
He "follows up the plow."

The Days of Long Ago.

I wonder are the fields as green, the skies as brightly bine,
The birds as joyous in their songs, the flowers as bright in hue—
Wild roses blushing fresh and fair in many a green hedge row—
As sweet as those I gathered in the days of long ago.

"Oh yes," replies the maiden fair, with voice of melody,
With sunbeams in her waving hair, and eyes like summer sea,
"Yes, yes," responds the gallant youth, scarce pausing to reply,
While high resolve and happy love beamed in eager eye.

Oh speed ye toward the mountain tops we wise old graybeards say,
Yet are ye not so light of foot as we were in our day.
So hardy on the rocky paths, so blithe among the bowers,
So stout of heart as we were when your happy sire was ours.

Oh, speed ye toward the mountain top ye maidens fair and sweet,
While spring flowers deck your bowing hair and

dewdrops bathe your feet—
With star bright eye, with rose bright cheeks, yet are ye not, you know,
So lovely as the girls we loved a long time ago.

We linger in the lighted halls, for still we fondly prize
The echoing laughter of young lips the sunshine of young eyes,
Yet here we shake our wise old head and say with faltering tongue,
Old friend, things were not so, when you and I were young.

The dance may sweep its giddy round, the song its silvery flow,
What are they to the dance and song we joined in long ago?
Thus looking from the hills of age along youth's distant glades,
We mark the lingering sunlight there, but will not see the shades.

But oh! we miss the lightsome form, we miss the flowing curls,
We miss the buoyant hearts we own'd when we were boys and girls;
We linger fondly on thy joy, forgetful of thy woe,
O! happy age! O! golden clime! delusive long ago.

City Gardening.

The Sun and the Rose.

BY ALICE GRAY.

The sun, who smiles wherever he goes
Till the flowers all smile again,
Fell in love one day with a bashful rose
That had been a bud till then.

So he pushed back the folds of the soft, green hood,
That covered her modest grace,
And kissed her as only a lover could,
Till the crimson burned in her face.

But woe for the day when his golden hair
Tangled her heart in a net,
And woe for the night of dark despair,
When her cheek with tears was wet.

For she loved him as only a maiden could,
And he left her crushed and weak,
Striving in vain with her faded hood
To cover her guilty cheek.

The Flower Garden.

BY MARY HOWITT.

God might have bid the earth bring forth
Enough for great and small,
The oak tree and the cedar tree,
Without a flower at all.

He might have made enough, enough
For every want of ours—
For luxury, medicine, and toil,
And yet have made no flowers.

Our outward life required them not—
Then where fore have they birth?
To minister delight to man;
To beautify the earth;

To comfort man; to whisper hope
Whene'er his faith is dim;
For whoso careth for the flowers,
Will much more care for him.

SEASONABLE ADVICE.

WHOEVER expects to be successful in cultivating flowers and lawns, in our dry climate, must make provision for plentifully irrigating them. Many persons in town have hose that may be attached to the water pipes and irrigate everything either by showering or flowing over the roots. When so provided, a little care only is needed to keep everything in splendid condition.—Neglect is fatal to tender plants, and unless plenty of water is given, any plant will soon show suffering by a wilted look and the lower leaves turning yellow. With sufficient water and soil and shelter from winds, plants will grow most luxuriantly and will reward the care given them in living beauty and sweetness. Where water cannot be conducted upon plants or the surface soil cannot be wet without great trouble, and one wishes a few choice plants only, it is well to sink some tin or other vessel like a can, or flower pot with the bottom plugged, below the plant so as to hold water enough to last the plant a day or two at a time. The vessel should be first filled with pebble stones, old bones, or lumps of charcoal, and set be set about four inches below the surface, with some coarse material like straw or sacking placed over it before the soil is, to keep it from filling with fine soil. Then a hole should be left through which the water can be poured, covering it with a small stone or convenient thing. In this way plants can be kept growing with the least waste of water about the house in very dry and hot places. Still another way, and a very good one, too, is to dig trenches eight inches deep and a foot

wide all about wherever you want plants to grow, and either lay down troughs or fill with coarse gravel. At one end of this winding set of trenches, which should be all connected and as nearly level on the bottom as possible, have an upright box made to pour or pump water into, so that it may run all through the trenches. Plants set over or near these trenches will get watered from the saturation of the soil from underneath. This is certainly a very nice and economical way to prepare for the irrigation of a garden on a small scale where a good showing of plants is wanted and not much water can be easily obtained.

Heavy soil should always be well manured and covered a few inches deep with fine sand, or very sandy soil, to make it right for cultivating plants to advantage. This advice will apply whether one resides in the city or the country. When you once get a little place ready for a garden—and getting it fixed just right is frequently more than half the work—everything will then be reduced to a system, and you will feel encouraged to do your best, with the assurance that you will be rewarded with success.

There is nothing in a yard that looks prettier than a lawn. Even if the yard is small, a single patch of grass, with a plant or bunch of flowers growing in the center, will look lovely. But remember that without liberal watering a lawn, in this dry climate, cannot be a success.

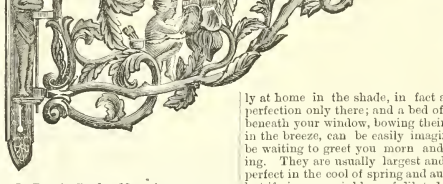
Some one makes the following practical remarks: "Close feeding has the same effect upon grass that close shearing has upon our hedges or ornamental trees. If let alone, they run up tall and the branches are open and straggling, but if they are kept closely sheared, the growth may be so close and fine that a bird can hardly find entrance. So grass, closely fed or sheared, grows thick and fine, and although, to the casual observer, it makes less show, yet it really produces more nutriment to the acre than if left to run up to seed. The lawn mowers, which have come into such general use in villages within the past few years, have proved the advantage of close and frequent cutting for producing a fine thick turf." Of course, it will not pay to get a lawn mower to trim a very small lawn. It can be more economically done by hand.

Last month, we gave directions for planting seeds in boxes, pots, etc. If you have not started your annuals now is the time to commence, and there is little time to be lost. You can start seeds where you want them to grow, if you will observe the following rules: Prepare the soil by spading lightly and raking as fine as possible. It is best if some fine, well-rotted manure is worked lightly in the soil. Now thoroughly saturate the soil with water from a sprinkler. After it is well settled, but while it is still wet, make an impression not over one-half of an inch deep where you wish to drop your seed; drop and cover with sand mixed with saw-dust or fine pulverized manure; sprinkle again, and cover with sacks or paper fastened down to keep the air from drying out the soil, or panes of glass, or even a board can be laid over the seed beds. Every day remove the cover and sprinkle, until you see the young plants, when you may remove the covering. To keep insects from destroying the young plants, sift dry ashes or road dust over them after watering, but not while the young plants are still wet, wait till the moisture has evaporated from their tiny leaves.

If you wish to transplant any of your plants—and you may if they come up too thick—follow this rule, which we clip from the *Germantown Telegraph:* "There is no mode we have tried so effectual in transplanting tomato, cabbage, cantaloupe, or any other tender plants from the hot-bed or from one place to another as to prepare a vessel filled with manure water and rich soil, about the consistency of thin mush, with which the roots of the plants should be well coated and set in a hole made with a sharp round piece of wood or dibble. After being firmly planted, moisten again with manure-water. We have never failed in any transplanting when done in this way, and the trouble is very slight."

In arranging flowers in beds, it is well to observe harmony of colore, and attend to the following rules: "Avoid placing rose-colored next to scarlet, orange or violet. Do not place orange next to yellow, or blue next to violet. White relieves any color, but do not place it next to yellow. Orange goes well with blue, yellow with violet. Rose-color and purple always go well together."

We have given little advice about what varieties of plants to cultivate. Each person has some favorites, and it is well to gratify one's own taste in such matters. Certain plants are considered preferable by very fashionable people, but if plants are suitably and neatly arranged to show to advantage, it matters little what they are. Tall plants should be put where they will not hide the smaller ones.



In Root's *Garden Manual* are some excellent hints, a few of which we take pleasure in copying: "For a screen or background, the larger sorts of Lupines, Hollyhocks, Marygolds and Zinnias produce an excellent effect. To lend a tropical appearance, the larger varieties of Ricinus, set only two feet apart, are valuable. For a close, impenetrable screen or back ground, all the climbers are serviceable. The Cobea Scandens is one of the best, growing rapidly, and on rich soil running twenty feet and more, with abundance of large, bell-shaped flowers. Dolichos is especially valuable for a light soil, and beautiful with its purple flowers and seed-pods. Morning Glory is especially of service in the shade. The Wild Cucumber will grow most thriftily, and cover the objects most effectively of any, and lift clear above its foliage a mass of yellowish white flowers, in hyacinth-like trusses, and for this purpose is very popular wherever tried. Nasturtium, grown with the latter, fills up the vacancies near the ground, and mingles its variously colored bloom prettily with the other, producing an excellent effect."

As to choosing colors for bedding plants, we copy this from Briggs Bros.' *Floral Work:* "Some may desire to fill separate beds with flowers of a single color and of such kinds as will have a fine appearance and bloom the whole season. These may be selected from the Dianthus, Phlox Drummondi, Pansy, Verbena, Salpiglossis, Stocks, Balsams, Zinnias, etc. Red and shades of red—Phlox Drummondi, Zinnia, Portulaca, Catchfly, Aster, Cacaliaecocinea, Cockscomb, Poppy, etc. White — Phlox Drummondi, Candytuft, sweet Alyssum, Dianthus, Stocks, Aster, Portulaca, etc. Blue—Ageratum Mexicanum and Tom Thumb, Lobelia, Aster, Larkspur, Nolana, Nemophila, Whitlavia, Lupines, etc. Yellow—Calliopsis, Eschscholtzia, Sanvitalia, Platystemon, Marigold, Zinnia Haageana fl. pl., Portulaca, Erysimum, etc.

Mr. Root, in his *Manual*, has this to say about flowers for the shade: "Many a little yard in town, deep in shade, could be made beautiful; the shady plat before many a sitting-room window could be made fragrant and blooming, were the planting only judicious. The Morning Glory, hiding from sight all that we would screen, will every morning the summer through give an abundance of bloom in more deeply, delicately, richly tinted colors that the painter's brush can paint. The Adonis, with its pretty, finely-cut foliage and blood-red flowers, flourishes in the deepest shade. To produce the best effect, the plants should stand thickly in the row, five or six to the foot. Sown late in August, it lives through the winter with a protection of stalks and leaves. The Pansy is perfectly at home in the shade, in fact attains perfection only there; and a bed of them beneath your window, bowing their faces in the breeze, can be easily imagined to be waiting to greet you morn and evening. They are usually largest and most perfect in the cool of spring and autumn; but if given a sprinkling of diluted liquid manure occasionally, and thorough waterings in dry times, they will continue of large size the summer through. Calliopsis and Evening Primrose bloom the season through in the shade, quite as well as in the sun. Evening Primrose, Larkspur, and Marvel of Peru, seem to attain their greatest perfection in partial shade. Mignonette seems just as fragrant and quite at home in such situations. Ipomopsis does well in shade or sun. Petunia, Myosotis, Lobelia, Antirrhinum, Sweet Alyssum, Candytuft, and most of the climbers do well in moderate shade where the sun occasionally peeps in. The strong-growing Zinnia does little in vigor or colors if in the shadow."

There is much more that we wanted to say this month, but are pushed for room. One hint more, and we close.

Now is the season for picnics, and if you go into the wild woods, do not fail to gather up some of the plants you may find growing there. Three years ago we gathered in a deep glade, upon rocks, a lot of moss and ferns. The moss was in beds with fern roots running thickly through it. It was little troubled to peel the moss, like a pelt from the rocks. One piece was as large as a blanket and about two inches thick, full of fern roots. When home, we cut it in suitable pieces to line hanging baskets and two wire plant stands, then transplanted into the baskets and stands elegant flowering and leaf and trailing plants. With plentiful watering, the ferns came out thickly with feathery leaves, while the green, velvety moss was just splendid. Such handsome stands and baskets we never saw before, and they are still pretty, though getting a little brown with age, and need reconstructing. Since then, others have followed suit, and now in San Jose such fern-covered baskets are not rarely to be seen.

Domestic.

FAMILIAR TALKS---No. 10.

BY SNIP.

IF Flora will soak her table-cloths in cold water before putting them into the wash-water, I think she will no trouble in getting tea, coffee, or fruit stains out. If it is possible to bleach clothes, the soaking is not necessary. I have no grass plot that can be used for such a purpose, but am so situated that I can leave the clothes on the line all night if I wish, and have no fears of finding an empty close-line in the morning. I used a rope for about three years, and then obtained a galvanized iron wire that I would not exchange for all the rope clothes-lines in the county. It remains out doors all the time; no trouble to put up and take down every week, and it does not break and let the clothes into the dirt; it does not rust, and it takes less time to wipe it off than it would to put up a rope.

I, for one, would like to have Mrs. L. W.'s recipe for washing calicoes and prevent their fading, and in return will tell her how we got rid of lice on our goats. It was simply by greasing them. I think any kind of fresh grease would do. A plentiful supply was put on the back which melted and run down. The ears, face and neck were rubbed well with grease and we had no more trouble.

Pears, if thoroughly ripe, make excellent sweet pickles prepared in the manner that Mrs. L. W. makes currant and peach pickles. If the pears are not entirely ripe, boil them in the syrup about half an hour, not hard, but gently, or they will break in pieces.

Will some one please tell me how to make cucumber pickles, and how old they should be when pickled?

Here are two recipes I cut from an old paper, but they were new to me and may be to some of the readers of the Agriculturist:

TOMATO SOUP.

Boil one pint of canned tomatoes for twenty minutes in one pint of water; add half a teaspoonful of soda, and one pint of milk. Season with butter, salt and pepper and crackers as for oyster soup.

POTATO PUFF.

Two cups cold mashed potatoes; add two tablespoonfuls melted butter, beating to a cream; two well-beaten eggs and one cup cream or milk. Bake in a quick oven.

BAKE-DAY CAKE RECIPE.

After kneading your bread save dough enough to fill three tea cups; add one and a half cups of sugar, one cup butter, two well-beaten eggs, and one cup of seedless raisins; work all thoroughly together with the hands; let it stand in a warm place half an hour; make into one large loaf.

Mrs. L. W.

Apiary.

Six Months Among the Bees in California.

THE "BLUE SIDE" OF THE QUESTION.

YOU have had in your journal from time to time, during the past year, many rose-colored reports from this country, which are inclined to mislead your army of readers at the East, who have felt an interest in this land of honey. A few items of other facts may also be of interest to your readers, from one who has had pretty good facilities for "learning the ropes," though I do not profess "to know it all," yet.

The first thing an apiarist does after his arrival here, is usually to hunt up a "ranch," or location, on which to establish his apiary. This is usually located on government land, after many weeks search, and may then turn out not to be a good one. The main point is to get within the granite or bee range—a strip of mountainous country 8 or 10 miles wide, extending from Lower California up into Los Angeles county, over 100 miles long.

To select a location here intelligently, one needs to be somewhat of a botanist, or at least to know by sight all the different kinds of honey-plants, their order of blooming, and the relative quantities of each required. Of course one cannot find everything just as he would order it; but take as near a perfect pasture as he can find. In the early days of bee-keeping as a business in San Diego county, the ranches were established on the Sweetwater, a "California stream," which runs out east from just south of the town of San Diego, among the mountains. It is only within the past two years, or since the great excitement began, that other localities were sought for further north. At this writing nearly every location, good, bad or indifferent, has been settled on as far as Temecula, 75 miles north of San Diego, to which point all the products of the apiary have to be carried in wagons, and all supplies brought out, making it very expensive to carry on the business. The roads generally are good, but as all the mountain ranges tend from the seashore toward the southeast, it is easily seen that there are some heavy grades. All or nearly all the teams we meet in traveling are four or six horse—two to draw the wagon, and the balance the load.

There are few "old settlers" except "greasers," or Indians and Mexicans. The former are half-civilized, dress like whites, live in adobe huts, and either herd their own flocks of cattle, sheep or horses, or else are herders for the Mexican stock men. Since the great rush and settlement in Los Angeles county, which lies next north of this, the larger portion of the sheep men have had to search other and less populated sections for their flocks.

Many thousands of sheep were driven into this county, where they are now overstocked, many herds decreasing in numbers from insufficient food or water. The price, too, this fall for the wool—9 cents or 10 cents—has disgusted many with the business.

Cattle and horses will not feed after sheep.

The stock men dislike to see new settlers come in, as the laws here require herding of stock or suits for damages. The "bee men", too, dislike to see stock around them, particularly sheep; for although they eat but sparingly of the white sage and other honey-producing plants, they break down the brittle stems, and soon wear out a fine field.

California is famed for its freedom from insect pests injurious to fruit. While that may be true, it nevertheless is quite true that a worm was found in nearly every white sage flower last spring, which will account for the rarity of pure white sage honey in market this year. This worm, with the April frost and extreme dryness of the season, cut off the crop of honey to an average of not over 25 lbs. per hive, and an increase of not over 25 per cent. Indeed, I know of one apiary of 250 stocks which gave but two swarms this whole year, and when I was there last—at the end of the busy season—the owners had taken but 99 cases of honey. One other apiary of 150 stands came out equally bad, and both did remarkably well last year. One apiary of 500 hives did not give a single pound of surplus. I have heard of but half a dozen or less in this whole county who have made enough to pay expenses, counting the time and attention required as anything. One gentleman had 150 stands, hired an experienced apiarist at $45 per month and board. In return he got seven cases, or 400 lbs. of box-honey, and an increase by dividing of some ten or twelve stands. There are many long faces among the bee men, and many a poor fellow would like to sell out and quit. I sincerely believe that for a man who understands the business, and whose heart is in the work, bee-keeping here will pay in the long run; still, I think some changes in the prevailing methods of gathering and marketing the products are necessary.

It seems that there has never been any effort made to save the large surplus of honey from the manzinita and blue sage, which bloom in January and April, because they do not produce quite so white a honey as the white sage, and yet many a hive at these times becomes too full of stores for the good of the colony.

At the time (May 20th to July 20th) when the white sage is in bloom, the sumac and grease-wood also yield fully as well. The color of the sumac honey is several shades darker than either of the others, so that it is rare to find sections filled exclusively of either sort.

Possibly the extractor will be reverted to, at least to give it a fair trial to know whether or not it will pay.

Those who are engaged in bee-keeping rarely do anything else, consequently each one has to watch carefully for the best reward for his labor.

There are few cultivated farms in the country, which are as large as a good sized state—the habitable portion being about 60 miles east and west, and 100 miles north and south. Take either of the two roads leading up north from San Diego, you may travel twenty miles and not see a cultivated field. It is a constant warfare to get and keep things growing. The gophers, ground squrrels (grey and but little smaller than the grey squirrel at the East) and kangaroo rats are omnipresent, eating the seeds or young plants as they appear. Dozens give up in despair of raising even their own vegetables on this account. Some of the land is *moist*, on which, if properly guarded, nearly everything will grow, and with marvelous rapidity. But such land is the exception, and wherever found in any considerable quantity, it is pretty sure to be covered by a grant, and consequently not to be settled on.

Very little rain falls from April to November—in fact but one shower has fallen since May 1st, and that wet the parched soil but from two to four inches, and was speedily dissipated under the succeeding days of sunshine.

I have not seen any estimate of the relative proportions of cultivable lands too worthless, but my judgement is that not one acre in fifty is good for any purpose of cultivation. The mountains and in fact almost the entire country is bare of trees. The extreme dryness of the climate producing only bushes of a stunted growth averaging five feet high, over tens of thousands of acres in one body.

The principal bush and at the same time, the most worthless for bees, is the chemise or chemisel—a harsh, rough bush from 4 to 6 feet high, through which it is impossible to go either on foot or horseback. The little forays occasionally made upon it only result in torn clothes, bleeding hands and bad tempers. Of course in such a country, from the great scarcity of timber, wood is high and not of good quality.

Such as is taken to market being either small limbs of an inch in diameter, or short, crooked, intractable sticks, which successfully resist the ax, but bring a good price in money. Of churches, there are several in San Diego—not one, to my knowledge, in the country outside the city, except Catholic, and the service in these is usually carried on in Spanish.

There are a few school-houses, but the people live so far apart that the children cannot attend. It is twelve miles from where I am located to the nearest school-house or any other public building.

As a consequence, the children must be taught by their parents, or allowed to grow up in ignorance.

The idea seems to prevail that all are here temporarily—that as soon as enough is made to live on elsewhere to pick up and leave.

Physcians are rare outside the town of San Diego—and when called upon to go out 20 to 50 miles to attend a case, their charges are simply extortionate. I recall one case of a charge of $1,000 for going 50 miles.

It is all very well for people at the East to keep bees, where they are surrounded by the comforts and amenities of life—they *ought* to have some drawbacks, for on coming here, one abjures comfort, society—everything.

To place a man alone on a bee-ranch for a year, he is a fit subject for a lunatic asylum—the solitude is terrible. The oppressive silence of these canyons and mountains with no trees through which the light winds can sigh, the nearly entire absence of birds of song to gladden the heart; the distance to neighbors, all contribute towards the feelings one might have in solitary confinement.

Coming to California, you give up forever all your old associations and enter a new world. The trees, the flowers, the birds, the climate, the soil, the sky—all differ from what one has been accustomed to from childhood.

It is true they call many trees, bushes and birds here by the same names they do at the East, but you fail to recognize them, and soon come to the wise conclusion to accept everything as strange.

While the farmer has so many difficulties in the way of getting crops to grow, all is not plain sailing for the apiarist. The moth miller has twelve months in a year here to work. Skunks and ants abound.

A skunk will get up in front of a hive and tap on the front of it until enough bees come out and get entangled in his hair for a meal, when he will roll over and over until the poor bees are crushed or stunned, and then he will eat them. Poison, or traps, have to be regularly inserted to keep them from despoiling an apiary.

Of ants there are many kinds: from the wee red one of one-sixteenth of an inch in length to those of an inch or more.

On account of these legions of ants, they have to make stands for their hives to set on, and keep the legs greased with coal-oil or axle-grease, or any other nauseous thing to repel them. Houses intended for honey have to be set on stilts, which are kept greased to keep out the pests. This is really the plague of the country; and any man who will invent an "Ant Destroyer." sure to kill or drive them away, can come and make a small fortune selling it.

The water is generally good, though hard, and is usually found at less than 30 feet in depth. I do not know of any artesian well in the country, but would suppose they would be tried, to avoid the great loss of crops during the long seasons of drouth.

In the town of San Diego, the water is not good, but such as it is, is sold at the rate of three cents a bucketful.

The Water Company is now trying to remedy this by pumping water from the bed of the river of the same name. Nearly all the water we get from wells is warmer than the outside air, when first drawn, so that you have to let it stand and cool. Ice is out of the question. A little is brought down from somewhere up toward the North Pole, and sold at 5 cents a pound.

Those of us who keep horses, usually have to by hay for them or submit to their getting too poor to do any work during the long dry season.

Hay in this country is not the hay of the Eastern States. It is wheat, barley or oaten straw, cut while yet green. This is often hauled fifteen to thirty miles, as it is only at rare intervals that any is grown.

The seasons here are two—the wet and the dry. The former extending from December to March, during which time rain usually falls in sufficient quantities to overflow the sand in the beds of the streams, and even create a torrent through which, over the treacherous quicksands of the streams it is dangerous to cross. Some of the streams are bridged, and few have steep banks where the roads cross them. At this season of the year, the real summer in California, the country gets green and is beautified with flowers.

With the advent of March, the ground dries up, vegetation dies, and by the first of May the country looks parched and brown. From this time on to December, the same state exists, with nearly the same temperature.

The climate, meantime, is superb. Nothing any of us have ever been accustomed to will equal it. And this one thing, *climate*, is the great charm of the country. I have not heard it thunder but once in six months, and that was a weak roll. Neither have I felt any strong wind during the same time.

The nights are invariably calm, or with the gentlest of low breezes wafting the deliciously soft air across the sea. The early mornings are often foggy and nearly calm until nine or ten a. m., durduring which time, if it chance to be clear, is the hottest part of the day. Then the sea breeze springs up, gently at first, increasing to a fair breeze by one or two p. m., and then dies down again, and thus will go the rounds—the same thing day after day, week after week, and month after month.—*G. F. Merriam, San Diego, Cal., in American Bee Journal.*

A MAN said to his gardener: "George, the time will come when a man will be able to carry the manure for an acre of land in one of his Waistcoat pockets." To which the gardener replied: "I believe it, sir; but he will be able to carry all the crop in the other pocket."

Hygienic.

PRACTICAL HEALTH TOPICS---NO. 3.

BY "JEWELL."

SLEEP.

DO all the mothers who read the AGRICULTURIST feel the deep importance of sleep for their infants and growing children? This is a question I have often thought of, and in watching my neighbors and friends, patients and strangers, when opportunity offeres, I have about arrived at the conclusion that few even think upon the subject, and a small proportion act upon their convictions. The consequence is, we see sickly, pale, delicate, stunted, nervous girls and boys about us, and frail, *dying* men and women. (I use strong language, because the case is a desperate on and requires prompt action on the part of parents and teachers.)

We will not stop to question who is to blame. Everyone who knows and feels the importance of raising strong, robust men and women to take our places in this world of action is to blame who quietly looks on, and sees civilization turn the night into day, and does nothing to warn the people of the danger sure to follow. I could begin by quoting the sayings of celebrated physicians and eminent writers upon this subject—which, perhaps, no one would read or follow, simply because society governs our habits of life to such an extent that even those very doctors and writers seldom follow their own prescriptions, but make willing sacrifices of their lives waiting on others for the good of humanity.

Many of our amusements and entertainments are at night; our lectures, concerts, social gatherings, church fairs, are nearly all held in the evening. Even revival meetings are carried on to the greatest extent at night, often lasting till after midnight, when the participants are in too excited a condition to calmly go to bed and sleep that quiet, refreshing sleep which alone enriches blood and brain. And yet this is a Christian land, and they claim to be working for the love of God and our good in these very revivals and protracted church meetings, while breaking a law of health. Are not our bodies the true temples of God? and does he not require that we keep them pure and holy, and uncontaminated by the world? Let us not discard any element of common sense from our religion. Perhaps we may learn from the Adventists and Mormons somewhat of good in this connection. For instance, Brigham Young has issued a decree that all entertainments are to begin at two in the afternoon and not last after ten o'clock at night; while the Adventists insist on rules of health as truly as any other in their creed.

I have seen mothers awaken their infants to show them to a friend, and others who thought it would make the children stupid to sleep so much; while it is a common practice to awaken the household at a certain time in the morning, so as to get the children to perform certain duties before school time.

Now this is all wrong. Children need, and *should have*, from ten to sixteen hours, out of twenty-four, good, sound, deep, quiet, sleep, with plenty of light, warm covering on, and plenty of fresh air, but no draughts. Eight o'clock should find every child under sixteen years old fast asleep, every night. This would give the parents one hour of quiet to read or chat before seeking their own rest. But how can this be done when we have so many calls out of an evening? Indeed, if we want to enjoy any social life we must lay aside our principles of right and join in with the masses. Even the children have their *evening* parties and Christmas entertainments at night, and some are allowed to go with their parents to church socials and the like, while many parents are obliged to take their children with them or stay at home. The old saying, "one hour before midnight is worth two after," is a true one; and regularity in sleep is very essential to children and grown folks, too. To the sick, sleep is their greatest restorer and best friend, as all know; without it, the physician's skill is useless, and all his knowledge powerless to make well.

Looking upon the American people as a "nation of invalids," as we are, the cry seems to come from our cradles and our tombs, "Give us more sleep!"

THE DOCTOR SPEAKS.

BY HELENA.

Listen, girls, for it is not often that he gives advice unasked. He tells us, in the first place, to dress lossely so that we can expand our lungs to the utmost with each breath we draw. Also, that the clothing should hang from the shoulders, instead of resting upon the hips. Corsets, he says, are a species of straight jacket, only worn in these enlightened days by those who are slightly demented. A back bone is preferable to a front one any time to keep the person erect, and the corset board is no more needed for the one one sex than for the other.

He tells us, girls, to avoid stimulating drinks of every kind, while we are yet young, so that as old age creeps on we may not find ourselves the victims of an uncontrollable appetite. Food alone nourishes the body, and by it every function in the living organism derives necessary support. Regular daily exercise in the open air is indispensable to good health. As our happiness and usefulness depend upon the physical condition of our bodies, we need use every means in our power to become as healthy as possible.

Then hear what he says about late hours: Sleep is the natural invigorator of the system. One-third of each twenty-four hours should be allowed for rest. Retire early, for one hour before midnight is worth two after. Then rise with the sun, for the morning hours are the cream of the day.

He has a word for the mothers, too, who teach their daughters a variety of indoor industries instead of encouraging them in open air tasks. Horticulture is one of the finest employments for women. Hire a cook, and set the girls to work in the garden. Plant vegetables, weed the garden beds, breathe fresh air and sunshine, instead of paying a gardener, and you will surely save the doctor's bill, besides having the satisfaction of seeing a merry group of hungry ones assemble around the table at meal time.

Rightly clothed and properly fed, with daily exercise in the fresh air and sunshine, serve to prepare the mind for activity to grasp whatever comes within reach. See to it, then, parents and guardians of the young, that the proper sort of reading matter is placed before them. Let their hours for study be during the sunny part of the day, and not prolonged beyond the strength, or until fatigue is felt.

He says that the thousand and one contrivances for killing time, so common among women of the present day, such as fine embroidery, fancy work, etc., are sapping the health of the nation. Who but the wives and mothers of coming generations should demand health as their inheritance? And thoughtful people every where would do well to listen and profit by what they hear when the doctor speaks.

FRIENDLY LETTERS--No 3.

BY MRS. M. E. T.

MEDITATIONS.

In bed, propped up with pillows, and in my arms six pounds of frail humanity, so frail that a breath might almost blow him away—thus I am resting and thinking. Outside the sun is shining, the birds singing, and all nature seems rejoicing. I look at the dear baby-face and wonder if I shall keep it. I think of my own aching body, and the everyday sameness of life to which I am bound by a chain of circumstances, and I wish that I, too, like my invalid friend, could enjoy the fresh mountain air.

Since my letter must necessarily be brief, permit me, in conclusion, a few remarks to your correspondent "R. A. E.," to whose kind inquiry I would say, No; O no! not satisfied after the manner of your supposition, for I think we agree with regard to the consequences of violating nature's laws. *That* is just where the trouble originates. The manner and customs of life of the majority of American women are sufficient causes for all the ills that flesh is heir to. But these evils have come so gradually upon us, and in such a variety of ways, that in many cases we are powerless to help ourselves individually. Nothing short of an united effort; and God speed the day when intelligent women shall, together, resolve to throw off the yoke of bondage that binds them now to such cruel burdens—the burdens of folly and fasion.

Something Which Concerns Everybody.

There lies a book before us written by Br. William Hargreaves, entitled "Our Wasted Resources." We wish that the politicians and political economists of this country could read this book, and ponder well its shocking revelations. They are revelations of criminal waste—the expenditure of almost incalculable resources for that which brings nothing, worse than nothing, in return. There are multitudes of people who regard the temperance question as one of morals alone. The men who drink say simply, "We will drink what we please, and its nobody's business. You temperance men are pestilent fellows, meddlesome fellows, who obtrude your tuppeny standard of morality upon us, and we do not want it, and will not accept it. Because you are virtuous, shall there be no more cakes and ale?" Very well, let us drop it as a question of morality. You will surely look at it with us as a question of national economy and prosperity; else, you can hardly regard yourselves as patriots. We have a common interest in the national prosperity, and we can discuss amicably any subject on this common ground.

During the year 1870, in our own State of New York, there were expended by consumers for liquor more than one hundred and six millions of dollars, a sum which amounted to nearly two-thirds of all the wages paid to laborers in Agriculture and manufactures, and to nearly twice as much as the receipts of all the railroads in the State, the sum of the latter being between sixty-eight and sixty nine millions. The money of our people goes across the bar all the time faster than it is crowded into the wickets of all the railroad stations in the State, and where does it go? What is the return for it? Diseased stomachs, aching heads, discouraged and slatterny homes, idleness, gout, crime, degradation, death. These in various measures, are exactly what we get for it. We gain of that which is good, nothing—no uplift in morality, no increase of industry, no accession to health, no growth of prosperity. Our State is full of tramps, and every one is a drunkard. There is a demoralization everywhere, in consequence of this wasteful stream of fiery fluid that constantly flows down the open gullet of the State.

But our State is not alone. The liquor bill of Pennsylvania, during 1870, was more than sixty-five millions of dollars, a sum equal to one-third of the entire Agricultural product of the State. Illinois paid more than forty-two millions, and Ohio more than fifty-eight millions. Massachusetts paid more than twenty-five millions, a sum equal to five-sixths of her agricultural products, while the liquor bill in Maine was only about four millions and a quarter. Mr. Hargreaves takes the figures of Massachusetts and Maine to show how a prohibitory law does, after all, reduce the drinking; but it is not our purpose to argue this.

What we desire to show is, that with an annual expenditure of $600,000,000 for liquors in the United States—and all the figures we give are based upon official statistics—it is not to be wondered at that the times are hard and the people poor. Not only this vast sum is wasted; not only the rapital invested is diverted from good uses, and all the industry involved in production is taken from beneficent pursuits, but health, morality, respectability, industry, and life are destroyed. Sixty thousand Americans annually lie down to a drunkard's grave! It were better to bring into the field and shoot down sixty thousand of our young men every year than to have them go through all the processes of disease, degradation, crime and despair through which they inevitably pass.

With $600,000,000 saved to the country annually, how long would it take to make these United States not only rich, but able to meet, without disturbance and distress, the revulsions in business to which all nations are liable? Here is a question for the statesman and the politician. Twenty-five years of absolute abstinence from the consumption of useless, and worse than useless liquors, would save to the country fifteen billions of dollars, and make us the richest nation on the face of the globe. Not only this sum—beyond the imagination to comprehend—would be saved, but all the abominable consequences of misery, disease, disgrace, crime and death, that would flow from the consumption of such an enormous amount of poisonous fluids would also be saved. And yet temperance men are looked upon as disturbers and fanatics! And are adjured not to bring temperance into politics! And this great transcendent question of economy gets the go-by, while we hug our little issues for the sake of party and of office! Do we not deserve adversity?

Dr. J. G. Holland, in Scribner's Monthly.

The difference in the amount of labor performed by a well fed man or animal and an ill fed one is considerable. There is no real economy in placing the laborer upon a starvation diet. Abundant and good food give bodily strength and contentment of mind which is an important item.

The Dairy.

The Highway Cow.

The hue of her hide was a dusky brown,
Her body was lean and her neck was slim,
One horn turned up and the other down,
She was keen of vision and long of limb,
With a Roman nose and a short stump tail,
And ribs like the hoops on a home-made pail.

Many a mark did her body bear;
She had been a target for all things known,
On many a scar the dusky hair
Would grow no more where it once had grown,
Many a passionate parting shot
Had left upon her a lasting spot.

Many and many a well-aimed stone,
Many a brickbat of goodly size,
And many a cudgel, swiftly thrown,
Had brought the tears to her bovine eyes;
Or had bounded off from her bony back,
With a noise like the sound of a rifle crack.

Many a day had she passed in the pound,
For helping herself to her neighbor's corn,
Many a cowardly cur and hound
Had been transfixed on her crumpled horn,
Many a tea potand old tin pail
Had the farm boys tied to her time-worn tail.

Old Deacon Gray was a pious man,
Though sometimes tempted to be profane,
When many a weary mile he ran
To drive her out of his growing grain.
Sharp were the pranks that she used to play
To get her fill and to get away.

She knew when the deacon went to town;
She wisely watched him when he went by;
He never passed her without a frown,
And sat on his gloom in each angry eye;
He would crack his whip in a surly way,
And drive along in his "one-hoss shay."

Then at his homestead she loved to call,
Lifting nie bars with her crumpled horn,
Nimbly scaling his garden wall;
Helping herself to his standing corn,
Eating his cabbages, one by one;
Hurrying home when her work was done.

Often the deacon homeward came,
Humming a hymn from the house of prayer,
His hopeful heart in a tranquil frame,
His soul as calm as the evening air,
His forehead smooth as a well-worn plow,
To find in his garden that highway cow.

His human passions were quick to rise,
And striding forth with a savage cry,
With fury blazing from both his eyes,
As lightnings flash in a summer sky,
Redder and redder his face would grow,
And after the creature he would go.

Over the garden, round and round,
Breaking his pear and apple trees,
Tramping his melons into the ground,
Overturning his hives of bees,
Leaving him angry and badly stung,
Wishing the old cow's neck was wrung.

The mosses grew on the garden wall;
The years went by with their work and play;
The boys of the village grew strong and tall;
And the gray-haired farmers passed away.
One by one, as the red leaves fall;
But the highway cow outlived them all.

All earthly creatures must have their day,
And some must have their months and years;
Some in dying will long delay;
There is a climax to all careers;
And the highway cow at last was slain
In running a race with a railway train.

All into pieces at once she went,
Just like the savings banks when they fail;
Out of the world she was swiftly sent;
Little was left but the old stump tail.
The farmers' cornfields and gardens now
Are haunted no more by the highway cow.

—[Eugene J. Hays.

PUERPERAL OR MILK FEVER.

MANY valuable cows are lost every summer from the disease known generally as the milk fever. The name, "milk fever," probably arises from the sudden drying up of the milk. Cows are usually attacked with the puerperal fever the second day after calving; and at the time of having the third calf seem to be the most susceptible.

This is one of the many cases where prevention is better than cure, although cure is not always impossible. But a cow never seems to fully recover from the effects of such sickness. In order to use means for its prevention, it is quite essential that the causes should be well understood, as also the nature of the disease.

Cows low in flesh and not over-fed about the time, and just before calving, seldom or never are troubled with the disorder. It is the full, fleshy and well-fed cow that is in danger. The fever arises from congestion of the womb, which, instead of contracting after the birth of the calf, the blood-vessels become surcharged with blood from inflammation, and if not relieved mortification soon ensues.

High feeding, upon such food as is constipating, is the cause. In other words, the system is filled with rich blood, and in this condition a fever is sure to result from inflammation. A low diet, of a loosening nature, such as green grass and bran mashes, is the best a week or two before the cow calves. The bowels should not be allowed to become constipated. Many persons naturally think that, in order to make the cow give a good flow of milk, it is best to feed highly of rich food a while before she has her calf. And this high feeding is the very worst thing that can be done. A low diet of green grass or other physicking feed, so as to keep the bowels free and the blood thin, is a sure preventive. With thick, rich blood, and warm weather coming on, together with high feeding, the increased digestive powers of the cow at this period so oversupplies the system that a morbid action with non-contraction of the uterus is almost sure to follow with all the serious consequences.

Should the cow be discovered to be sick a day or two after calving; if she fails to notice her calf, is listless, does not rise, and staggers at the attempt; if the eyes are glassy and cannot wink, the head hot, and apparently in great pain—the case is one of milk fever.

The treatment must be immediate, for the disease runs its course in a few hours. Physic with a pound of epsom salts and give enemas of soap suds to immediately relieve the bowels, as they are always constipated in such a fever, and unless they are freed the cow cannot recover. The brain is affected with congestion, usually, in sympathy with other affected organs. Keep the head cool with water or ice; and with hot water, blankets and hot bricks keep the body about the hips warm, with an occasional dash of cold for reaction. Give cold water as often as she will drink, but do not give any kind of stimulants or food until after recovery is certain.

Jersey Milking Can.—This can is of tin, globular, with a flat bottom and a rim around it. The upper part of the globe open, and has a flaring top, which is about eight inches in diameter at the edge. A handle, like a pitcher handle, is upon one side, attached to this flaring top. When in use, a rather closely woven linen napkin is tied over the top, and under the handle, so that it will sag down into the can to a depth of three inches or so. In this sag of the strainer a sea-shell is laid—one of the shells of a scallop being usually employed. The streams of milk strike into the shell, and the foam soon rises and nearly fills the strainer; specks of falling dirt mostly rest upon the top of the foam. Those which are carried down wash over the edge of the shell and lie beneath it. There is no spattering, and the milk is obtained entirely free from hairs and dirt, while soluble dirt which sometimes falls in, comes as little as possible in contact with the milk.—*Jersey City Journal.*

Questions for Dairymen. — Every dairyman should have a list of questions posted in some suitable place on his premises where his family and those in his employ, as well as his visitors, will have an opportunity to read them frequently. We give some questions, but the list can be extended:

Do your cows feed in swamps and on boggy lands?

Have you good, sweet, running water convenient for stock, and is it abundant and permanent in hot weather?

Have you shade trees in your pasture, or do you think that cows make better milk while lying down to rest in discomfort in the hot, broiling sun?

Do you use dogs and stones to hurry up the cows from pasture at milking time—thus over-heating their blood and bruising their udders?

Do you cleanse the udders of cows before milking by washing their teats with their own milk, and practice further economy by allowing any droppings to go into the milk pail?

Do you enjoin upon your milkers to wash their hands thoroughly before sitting down to milk, or do you think that cleanliness in this respect is not important for milk that is to be treated for butter making?

When a cow makes a mis-step while being milked, do you allow your milkers to kick her with heavy boots, or to pound her over the back and sides with a heavy stool, accompanied by sundry profane remarks addressed to the cow to teach her manners?

Is the air about your "milk barn" or milk house reeking with foul emanations of the pig sty or manure heap, or other pestiferous odors?

Good, fresh, clean water, and in abundance, is one of the most important requisites for milch cows, and it should be in convenient places where stock will not be required to travel long distances to slake their thirst. If springs and running streams cannot be had in pastures, a good well, with wind-mill and pump, makes an efficient substitute, and the waste water may, if necessary, be conducted back into the well, so as to keep up a constant supply of good, fresh water.—*Willard's Butter Book.*

About Milking.—Five per cent., and perhaps ten, can be added to the amount of milk obtained from the cows of this country, if the following rules are inexorably followed:

1—Never hurry cows in driving to and from the pasture.

2—Milk as nearly at equal intervals as possible. Half-past five in the morning and six at night are good hours.

3—Be especially tender of the cow at milking time.

4—When seated draw the milk as rapidly as possible, being always certain to get it all.

5—Never talk or think of anything besides what you are doing when milking.

6—Offer some caress, and always a soothing word when you leave her. The better she loves you the more free and complete will be her abandon as you sit by her side.

We append the not uncommon practice:

1—Let some boy turn the cows away, and get him who is fond of throwing stones and switching the hind ones every chance he gets.

2—Milk early in the morning and late at night, dividing the day into two portions, one of fifteen hours and the other of nine.

3—Whack the cow over the back with the stool, or speak sharply to her if she does not "so" or "hoist."

4—Milk slowly and carelessly and stop at the first slackening of the fluid.

5—Talk and laugh, and perhaps squirt milk at companion milkers, when seated at the cow.

6—Keep the animal in a tremble all the time you are milking, and when done give her a vigorous kick.

Brine that Will Preserve Butter a Year.—Among the many devices for keeping butter in a manner that will preserve the fresh, rosy flavor of new, with all its sweetness, is the following from the Duchess *Farmer:* To three gallons or brine strong enough to bear an egg, add a quarter of a pound of nice white sugar and a tablespoonful of saltpetre. Boil the brine, and when cold, strain carefully. Make your butter into rolls, and wrap each separately in a clean, white muslin cloth, tying up with a string. Pack a large jar full, weight the butter down, and pour over the brine until all is submerged. This will keep really good butter perfectly sweet and fresh for a whole year. Be careful not to put upon ice, butter that you wish to keep far any length of time. In summer when the heat will not admit of butter being made into rolls, pack closely in small jars, and, using the same brine, allow it to cover the butter to the depth of at least four inches. This excludes the air and answers very nearly as well as the first method suggested.

Milking Stools.—Let me tell how to make what I call a convenient stool. Take a piece of board about 8 inches wide and 2 feet long; nail short pieces across the ends to increase its strength and to bore holes through; put two legs 8 or 10 inches long in one end, and one a trifle shorter in the forward end. Place the stool where you intend to sit, the one-legged end where you usually set the pail. Place the pail on that end of the stool and sit on the other. If you do this you will have your pail out of the dirst and the cow cannot easily put her foot in it, as often happens when the pail is on the ground. Some cows are so low that you are obliged to set the pail on the ground. In such case turn your stool around.—*Farmer's Daughter, in Western Rural.*

[We have tried many ways of milking, and have found it most convenient to have a small, three-legged stool, and then spread a common barley sack that is ripped open across the knees and hold the pail between the knees. The sack assists in holding the pail steady, and also prevents the milk spattering upon the clothes.]

Curing Rennet.—Take the stomach of the calf fresh from the butcher, clean and salt, and pack in an earthen jar with brine. A few weeks previous to use they are taken out and drained of all brine, and dried. Take a forked limb of a bush and spread the rennet over it. It will be well to add a small lump of saltpetre to the brine in which the rennet is placed. When it is wanted take several small pieces two inches square and steep in warm water, allowing them to soak over night. A pint of water is sufficient. This will give a solution sufficient to "kurd" 100 gallons of milk. Flavored spices may be added to the solution if desired.

Swelled Bag.—When a cow's bag becomes swelled, a simple and generally effectual remedy is found in applying fresh lard, which should be thoroughly and repeatedly rubbed in. Some people use beef brine instead of lard, with good results. Plenty of rubbing without any application will often effect a cure. The calf should be allowed to suck until a

cure is effected, and if a portion of the milk is drawn from the cow before he is given his rations, so he will be obliged to do a good deal of stripping, he will help to reduce the swelling.

Whoever employs the violent remedies should understand that they may do more than is desired. Iodine affects the secretions powerfully, and causes the absorption of tumors and abnormal growths; may it not also cause a decrease in the secretion of milk? We have found that persistent rubbing and kneading was better than anything else. If the bag be very tender, as it often is, take a teaspoonful of tincture of arnica in water, and rub the same diluted with twice as much water upon the bag, to take our the soreness.

Water for Dairy Cows.—The Canada *Farmer* truly says that no animal should be required to drink water which the owner himself would refuse, and especially so if that animal is the cow from which you hope to make good butter. It is sufficient on this point to say that pure water is an indispensable article to the success of the dairyman, for good butter or cheese cannot be made where good water cannot be obtained.

It has been discovered, says an exchange, that cows that do not give down their milk may be cured of the habit by milking with only one hand at a time. This is said to be nearly imitating the calf, which ever asks for but one teat at a time, and hence the greater certainty in obtaiuing the milk. This has been proved a sure remedy for cows withholding their milk, at least in one inveterate case, and it may be worthy of a general trial.

Warts at the end of the teat are occasionally found, and are a great annoyance, not only obstructing the milk, but from their soreness causing the cow to become fidgety and uneasy while milked. In such cases they must be removed, either by the knife, or by a ligature of fine silk tied round it; the latter is the preferable mode, as warts when excised with the knife are more liable to return than when sloughed off.

Horticulture.

ORANGE GROWTH AND CULTURE

Valuable Information for California—Horticulturists' Practical Hints and Advice, Based on Thirty Years' Experience—Etc.

From the S. F. Bulletin.]

The State Department, a few months ago, issued a circular, addressed to all United States Consuls in foreign ports wherever tropical fruits are cultivated, requesting them to report upon the mode, conditions and extent of culture within the districts under their observations. This circular was issued at the instance of Senator Sargent, with a view to obtaining information that might be turned to practical account in various portions of California. The first response is now at hand. It comes from Edward Gillespie, our Consul at San Jose, Lower California, and abounds in valuable observations founded upon the experience of thirty years' residence in that country, and derived also, as he states, from the opinions of the most successful fruit-growers with whom he has, during so prolonged a period, been brought in contact.

Climatic conditions—artificial protection.

Mr. Gillespie writes as follows: First, I must state that a considerable difference is found in the orange fruit grown in different localities in this district; and I attribute this more to a difference of soil than of climate, for, although the temperature changes as you ascend the Sierra, yet, as far up as gardens are found, it does not fall to the freezing point. The rainy season here occurs during the summer months, and therefore the leaf or bud are not liable to cold storms. The leaf has its time to fall, but the incessant production of the new preserves the tree in its perpetual green. Any thing that blights or injures the leaf destroys or deteriorates the fruit, and, therefore, in a climate like that of San Diego, artificial means of protection must be resorted to, or sheltered spots selected for the groves. The fog from the sea is also injurious. A gentleman living near the beach at Cape San Lucas had some apparently fine trees in his garden which bore very little fruit, and that small and acid, and always on the leeward side from the sea breeze. He was an Englishman, and had seen wall fruit, and this reminded him of an idea; so he built, at little expense, a fence of long poles three feet apart, interwoven with brush (what they call here *cerco enramado*), some fifteen feet high, hiding its deformities by wild running vines. After that, all lower branches every year were filled with good fruit.

Selection of soil—mode of planting—irrigation—etc.

Now, as to the soil, there is no question that the rich alluvial of the bottom lands or mould of the valley is best for the production of fruit, though manuring may be a good substitute elsewhere. In a mixture of soil and gravel, or even in rocky soil, however, the tree thrives equally well. In fact, if you plant your tree in a crevice of rock, where there is sufficient soil below for the roots to expand, it is at home, but the fruit is not sweet, so full of juice, or so large. It is claimed for it however, that it ripens earlier.

The earth about the roots should be kept moist, but it is not necessary to deluge the ground near the trunk, and least of all with cold well water or water impregnated with minerals. The practice here is to irrigate every eight days.

Some of those who have the finest trees and best fruit here give their advice decidedly against ever transplanting the orange tree, and I have examined several trees which seem to warrant the assertion. The experiment is recommended of planting the seed four or five in a hill, with the hills twenty-five feet apart each way, and rooting out afterwards all but one plant, the best in each. The seed is planted here from November to January, as soon as the fruit is ripe and the seed dry. The tree is transplanted two years afterwards in the last of January or the first part of February, during the full of the moon. The orange tree is never grafted here now. All trials have resulted in a dwarfed body and inferior and diminished yield of fruit.

Pruning and care of the young tree.

There is a difference of opinion as to pruning. The general conviction is that the lower limbs should not be cut off more than six feet from the ground. The sprouts below this should be removed immediately when they appear, for they thrive with wonderful vigor on the tree and roots at the expense of the vitality of the fruit branches above. All superfluous limbs should be cut off and shortened in the spring. It would be commonplace to advise against allowing dead or dying limbs to remain on the tree. I should say the same regarding any limbs that appear sickly, producing a small and imperfect leaf. But the symmetry of the tree must be preserved as far as possible, not crowded by too much growth of wood, and thorns kept down with constant care. A fruit-grower requires no advice of this kind, and understands that the orange is a delicate tree and cannot thrive under neglect. To produce superior ruit it requires attention and cleanliness; and without this the tree, as it advances in age, becomes deceased or loses its vigor.

The time for thorough pruning and shortening the limbs here is the last of January. No mulching is done here or root-pruning; and the practice among our nurserymen of thinning out the fruit when overloaded is unwisely neglected.

The yield of fruit — how it can be gathered so as never to rot.

The orange tree, if taken care of, lives to a great age. It begins to bear at six years, and, on attaining its growth will give from 1,500 to 2,500 oranges in a season. The tree here blossoms in March, and bears from the last of September to December.

Too much care cannot be taken in gathering the fruit, which, if the thorn has been kept properly clipped, can be reached and cut off by a dexterous hand without even squeezing. Much harm is done by allowing it to be bruised. Of all things, it must not be plucked; the stem should be cut off close to the fruit. With these precautions it will never rot. Laid upon a platform of cane and ventilated from all sides, it will dry up in time, but not decay.

Effect of rain—commercial questions.

The effect of rain upon the trees and fruit during the months when rain is to be expected here, (July to 15th of October) is beneficial, clearing the leaf and giving it respiration; but what the result further north would be of the cold storms upon the stem, the leaf and the blossom, I leave for others to determine. We have in this country, however, (years apart) during the season of rain, *chubascos*—hurricanes of wind and rain—which precipitate all the frit to the ground and make sad havoc with the trees.

Oranges are worth here, piled under the trees, $3 50 per thousand; and packed in crates, with expense of freight to the beach and placed on board, about $5 per thousand. But, as very little attention is given to the delicate handling of this juicy fruit or to wrapping in paper or packing in boxes, the loss from rotting is a large percentage; so that after paying freight to San Francisco ($5), together with duties and other heavy expenses upon the gross amount shipped, the result is not always encouraging.

Of other tropical productions, such as the pineapple, sugar-cane, cocoanut, date, etc., it is not worth while here to speak. They are not adapted to the climate of Upper California. Cotton, indigo, rice, tobacco and coffee, grow in perfection here. The first two are indigenous.

In conclusion Mr. Gillespie says: "If Lower California were a part of the United States, exempt from heavy duties for exports of this kind to San Francisco, it would be, for all tropical fruits, the garden of California."

Do not suppose for a single moment that your neighbor cannot teach you any thing. The wisest man may sometimes learn a valuable lesson from a fool. The farmer who thinks he knows all there is to be learned will soon find himself considerably behind the times. Agriculture is now a progressive science and its professors and students must be wide awake and stirring.

Political Economy.

The *Southern Farmer*, of Memphis, Tenn., gives expression to the following strong sentiments upon important questions:

There was less corruption in the public service when the pay of Congressmen was small. Now it is ten thousand dollars and perquisites which runs up the compensation very high. And ever since then there has been more or less corruption in our legislation. Unscrupulous politicians now seek office for the pay it promises, and they know beforehand how much they can afford to spend in corrupting suffragists, to obtain the prize. The more pay there is attached to the office, the more corruption funds will be dispensed to obtain office. The main remedy is in a reduction of salaries. Let all legislators, State and National, have no higher wages than are earned by the industrious farmer and mechanic, and the temptation to use corrupt means to obtain office will be at once removed. In this way the honest and patriotic who will not consent to be assessed to pay whisky bills and lying newspapers will be offered some inducements to seek office for the good of the community. Let us have a general reduction of official salaries from Congressmen down in the National, and from Governor down in all the State governments. The great want of the times is honesty and economy in all departments of government.

There is a small minority of the people who are flourishing beyond all precedent. These are the money-lenders who, falsely claiming that money is property, demand unprecedentedly usurious rates for money loans. In this way they grow rich with great rapidity. But the high rates of interest demanded soon produced suspension and demoralized trade, and these a depression in prices unheard of; and now these money-lenderere, who have all along demanded the pound of flesh of the agriculturist, are flourishing off the misfortunes which their own avarice and unwise State legislation have brought upon the great mass of the people. Let us have cheap money rates and thus encourage all branches of useful manufactories, and these will give profitable employment to all, and thus restore a healthy trade and general prosperity.

The people of this country want economy and honests in the administration o government. They want fewer officf holders and smaller salaries for those that are really necessary. They want less expensive State governments, and less taxation. They want less legislation and better laws, more faithfully enforced. They want the State officials, who have been the head-centers of rings adverse to the interests of the people, to take back seats. They want all industrial interests developed, and all educational interests fostered. Let them make known their wants, and demand that an honest effort shall be made to promote them in all legislative halls during this Centennial year.

A California Gem. The California Agriculturist and Live Stock Journal, published at San Jose, Cal., is the neatest agricultural work received at this office. The typographical appearance of this work is superb, and its contents leave nothing to be desired. We have but one fault to find with the Western cotemporary—it is furnished to subscribers for $1 50 a year, a price by no means commensurate with its merits.—*Chicago, Ill., Drovers' Journal.*

Correspondence.

THE FARM.

The Nursery of Patriots, Orators and Statesmen.

BY JOHN D. SCOTT, M. D.

THERE is an old saying that "man makes the city, but God makes the country." Whether it be this divine impress, or the pure, calm quiet of country life that produces the effect, certain it is that the best and brightest intellects that have adorned the annals of history have been born and bred on the smiling plains and amidst the mountain homes of rural life. It may be that peaceful pursuits have a civilizing effect, that the unvarying order of the seasons establishes a similar state in the faculties of the mind, that the care of domestic animals cultivates the best affections and emotions of the heart, and that the quiet undisturbed occupation of the farmer naturally tends to useful meditation. This meditation —this concentration of the mental powers upon various subjects until they have been viewed in every possible light, is only that disciplining of those powers whose successful cultivation is rightly denominated "genius."

"This is not solitude, 'tis but to hold
Converse with Nature's charms and view her stores unrolled."

Books, though useful in their place, are not absolutely necessary to the discipline of the mind. Its faculties existed in all their God-like powers long before a book was ever written. Indeed, books are the evidence and the result of the existence of those powers. What is generally understood by self-made men are those obscure individuals who, never having had the advantages of a collegiate education, often astonish their neighbors and the world by the sudden display of mental capacities not hitherto suspected in them. They have had the same mental discipline that the students of our colleges enjoy from the study of the dead languages, mathematics, philosophy, history, etc., but their minds have been exercised and strengthened on other subjects, and in Nature's schools. Can any one believe that the mind of Patrick Henry was idle while watching his fishing line on the banks of some quiet stream? Was that of Newton inactive when he observed the fall of the traditional apple? Were the mental fires of Demosthenes quenched by the spray as he stood upon the sea shore, coping with the breakers' roar?

That scenery and climate both exercise a modifying influence on the human mind and character, can hardly be doubted when we compare the mountain Switzer with the Italian on the plains below, the Scotch with the Hollander, and the hardy and enterprising Yankee with his American neighbors of the plains of Mexico and the pampas of the La Plata.

But, however much, or however little mankind, like the chameleon, may take his hues from the colorings and circumstances of his surroundings, it is nevertheless true, that a vast number of the great and good men, particularly of our own country, have been the best products of agricultural districts. In saying this, however, let it be understood that we do not disparage the merits of those who have been city-born and risen to distinction amidst, perhaps, greater temptations. Nor would we be understood as ignoring, for a moment, the claims of the thousands who have rushed from the work-shop, the counting-room, the bar, the bench, and even from the sacred desk, at the call of their country, either to the tented field, to defend it, or to the councils of the nation, to sustain it.

This Centennial year our mind naturally reverts to the patriots who founded this nation. And first in importance, if not in time, looms up the venerable form of Washington, who loved Mount Vernon as no man ever loved a spot of earth before. It was always with a sigh of regret that he left it; it was always with a feeling of unutterable joy that he returned to its peaceful shades. Not all the crowns of Europe could have tempted him away; but when the stronger and sterner demands of duty required the sacrifice, he willingly wended his way to the North, to assume command of that feeble and undisciplined body of militia —it could not have been called an army —which had raised its feeble arms in rebellion against the proudest and most powerful empire on earth. And even in the midst of the conflict of arms, and often in the grave councils of peace not less difficult and important, his great spirit would wander away to his beloved Mount Vernon, as seen in his hundreds of letters to his agent. Having been an accomplished surveyor, he drew a map of the estate with mathematical accuracy. On it he traced every road, avenue, walk and cow-path, giving the positions, and even the species, of the trees that lined or overshadowed them. His lawns, meadows, tobacco fields and timbered lands, all had a place on it. With this map before him, in the tented field, in the midst of trying and perilous campaigns, or after victory had perched upon American banners and he had become the honored first President of the Republic, he would calmly sit down and write to his manager the most minute directions in regard to the management of the vast estate. Nothing was forgotten—nothing overlooked. In regard to the comfort and well-being of his servants he was most solicitous. Accompanying the shipments and sales of his crops were always full and explicit orders, down to the minutest particulars for clothing, medicines, dietetics and everything else that could possible contribute to their general welfare. A mind that could thus grasp the destinies of a nation and yet find ample time to care for the lesser, but not less imperative, interests of his dependents on the banks of the Potomac, deserves, as it has received from the world, the epithet GREAT. It is the eagle eye that sweeps the horizon—the eagle wing that braves the storm, but forgets not the helpless eaglets on the craggy hights at home. No wonder that the orators and poets of the world love to dwell upon such a character, for its goodness is unfathomable, and its greatness unmeasurable. The theme is as inexhaustible, practically, as the light and heat of the sun; and Washington's name and writings and deeds will be spoken, quoted and emulated "down to the last recorded syllable of time."

And next comes Thomas Jefferson, who, if, perchance, he may once have loved power and place more than his great Mount Vernon compatriot and co-worker in the cause of human freedom, did not love his own Monticello any the less. From the cares of state and the vituperation of bitter party opponents, he fled to that beautiful and quiet retreat, as the shipwrecked mariner seeks some hospitable roof from the horrors of the storm. With clear and well digested ideas upon government, an incisive style, and a well-marked character, that could not be turned from the right, he was calculated, like many others among our great men, to make warm friends and vindictive enemies. Mr. Jefferson, General Jackson and Henry Clay were, perhaps, the best abused men in America. At one time Jefferson's great heart nearly yielded to despair under the heavy weight of slander and obliquy which the political world rolled upon it. But his masterly intellect neutralized the crushing effect and culminated in that brilliant gem of wisdom, "*error can do no harm as long as reason is left free to combat it.*" At Monticello he spent the quiet evenings of his days in the society of his friends, in the reception and entertainment of the guests of the nation, and in giving his wise counsels to its rulers. Through that inscrutable providence "that shapes our ends," on the fiftieth anniversary of our independence, he and that fearless and able champion of liberty, John Adams, nearly at the same hour, joined "that innumerable caravan" that crosses but once the valley and shadow of death.

Jackson was emphatically one of the most perfect types of the American frontiersman. He was from the country people, and of the country people. Energetic, partaking more or less of the wildness of the primeval forest, his will was like the native oak, unyielding in its strength, and stubborn in its growth. His whole life was one long battle. If he was not fighting the land-grabbers of the West, he was engaged in a hand to hand conflict with the merciless savages of the forest; and if not with these, with the enemies of his country at New Orleans. When elevated for two terms to the chief magistracy of the nation, it would seem that his pugnacity ought to have ceased. But not so. Both of his administrations were hot continuous, and on his part, well-fought battles. But when his vital strength began to decline, and its slanting rays indicated the coming evening of life, shortly to be closed in the shades of night, the war-worn veteran began to think of home. And as a striking instance of human contradiction, so common in every day life, he had strangely named that home the Hermitage—a place of peace, of quietness, and of prayer—the very antipodes of his whole life. However, in the bosom of his family—amidst scenes of friends whose minds yielded to his iron will as the needle to the pole, in the fullness of years and of honors, he died, a sincere Christian, wept by his friends and forgiven by his enemies.

"De mortuis, nil, nisi bonum."

The great orator and statesman, Henry Clay, "the mill-boy of the Slashes," throughout a long, active and brilliant life, never forgot his obligations to the farm. Agriculture, no less than manufactures, owes a deep debt of gratitude to his eloquent efforts in its behalf both in and out of Congress. His was among the first voices raised in favor of fine stock, and that of Virginia and Kentucky to-day attests the wisdom of his foresight and the value of his example. He was, too, the father of the turnpike system, which was itself but the fore-runner of the rail and the iron horse. And his voice was ever heard in Congress in effective appeals for the improvement of the western rivers, in order that the country might be opened up to travel and settlement, and that the farmers might be able to transport their produce to market at the least possible cost of money and time. After having bestowed his best energies on the country, he, too, sought the shades of farm-life, and retiring to his beloved Ashland, lived like a sage and died like Christian.

Millard Filmore was but a poor, hard-working farm-boy, but he lived to represent his country at the court of St. James, where Queen Victoria pronounced him "the most perfect gentleman she had ever met." From guiding the plow he was at last called to guide the ship of state, and his administration compares favorably with any since the time of Washington. No name, perhaps, in our history so well illustrates the benign and fostering care of our noble institutions, under which the poor and friendless plow-boy may attain the highest station on earth.

"Honor and fame from no condition rise."

Harrison and Taylor were both tillers of the soil—the one a farmer of the West and the other a planter of the South. These may both have had more or less collegiate training, but their principal education was obtained in the forests, amidst the whizzing of arrows and the whistling of bullets. But when they were transplanted from their native soil to the uncongenial region of Washington City, like the old oaks of the forest under similar treatment, they withered and died, but left names for honesty and prowess that will endure as long as the fields of Buena Vista and Tipicanoe.

But if there ever was a legitimate child of the forest and the farm, it was Abraham Lincoln. Born in the midst of Indian wars—the brain of his own father having been pierced by the bullet of a merciless savage,—reared in the forest, where the sunlight never penetrated until with his young but stalwart arms he felled the timber and made it into rails to enclose the hard-earned clearing—what seer, what holy prophet, as he listened the young pioneer's ax as its echoes died away in the interminable fastnesses of the forest, would have dared to predict that the hand that then wielded the ax would some day guide the pen that would alter the industrial system of a nation, and change the destinies of a continent? Aye, who would have dreamed, in his wildest imaginings, that this untutored spectre of the wilderness would rise up and confront the polished Douglass, "the little giant of the West," and in the fierce encounter of logic would parry every thrust and neutralize every blow of the wily and practiced debater? Mr. Douglass himself candidly admitted that he had met a foe worthy of his steel. This political campaign gave "the Rail-splitter" a national reputation, and soon placed him in a position where his knowledge of "splitting" would be of incalculable value to the country in preventing others from "splitting" the Union.

Thus might we go on, adding line to line, and page to page, in the discussion of this interesting subject. We might have gone back to the Pilgrim Fathers, who were farmers in England and farmers after their advent to America. We might have culled other brilliant examples from "the times that tried men's souls"—Ethen Allen, Putnam, Mercer, Greene, Marion, Moultrie, and hundreds of others. Many of the signers of the Declaration were farmers. A large number of our Senators and Reyresentatives in Congress, both in the past and present, have been, and are farmers, and have been and are proud of the name. The same may be said of our Judges, Governors and Legislators. In fact, the farm is the goal of all ambitions, the *ultima thule* of human happiness. It is the natural state of man. It is a business upon which all other business depends. It is the conservator of political virtue. It is the paladium of human freedom, for as long as the farmers of a country remain virtuous and intelligent their liberties cannot be overthrown by any power that can be brought against them.

In this lengthy and, we fear, tiresome article, we have not touched upon a tithe of what might be said. We leave much, very much, to the reflections of our readers. One thought more and we have done.

How were these great and good men produced? Through what subtle training—by what wonderful alchemy—were they brought to the perfection of mind and character in which we behold them? We think these questions can be answered in two words, HOME EDUCATION. Their schools were the fire-sides, and their colleges and universities the sitting rooms of their homes. Their professors and teachers were their fathers and mothers. The first taught them *the practical lessons of life*; the second, *its moral obligations*, and engraved the principles of virtue so deeply upon their hearts that no time or circumstances could efface them! Has there been much of that kind of teaching during the latter half of our first century? We fear not. And if not, may not the negative fact account, in great measure, for the universal and acknowledged want of public and private virtue, honesty and moral principle?

SHALL WE PLOW DEEP?

ED. AGRICULTURIST: I did not promise to write you an article on deep plowing, therefore you will not be disappointed if I do not do it. There seems to be a spirit of inquiry into the reason why, and a desire to prove that deep plowing is what farmers most need to be successful in raising large crops on worn-out land. Mr. Burrell's statement, I think, is good and sound as far as it goes. But he said nothing of the soil to be treated after his style of cultivation, only that it was mountain land. That he regards deep plowing as a played-out hobbie, and he is not willing to admit of any exceptions, even on fine, sandy loam, I think his last step rather long for the times.

The gentleman one from San Jose, in his reply to Mr. Burrell, takes Mr. B. rather roughly by the scalp in his "critique" on Mr. B.'s style of cultivating mountain land. He thinks Mr. B. wants to evade "my facts" in regard to deep plowing. He states that he plowed a field "deeply." Now, Mr., how deep did you plow? Was it six inches, twelve inches, or fourteen inches? Much might depend upon the depth it was plowed. He gets a large crop on the land that was plowed deep, when, on the shallow plowed land, he only gets eight sacks of *potatoes*. It proved his hobby to his satisfaction. He also states that the soil was a fine, sandy loam. I must say that was good land for his hobby. But he does not state that he saw a piece of heavy, clay soil cultivated in the same manner, the same season, and in the same, or adjacent, neighborhood; and that the result of such cultivation on clay soil was the same as on fine, sandy loam. Now, right here is where the trouble all centers in deep or shallow plowing. It is to know what kind of a soil will be benefitted by being deeply plowed, and what kind of a season to plow it deep. The gentleman one mile from San Jose must not think that he can force his "facts" and "hobbies" on all kinds of soil and all kinds of seasons and be successful. There are thousands of farmers who are *sensible* that will tell him it can't be done with profit. What kind of a crop, think you, could have been raised last year on our high, clay soil if it had been plowed twelve inches deep, with the best surface cultivation within our reach? Not having a "hobby," I simply assert, no crop at all. At the same time, on a fine, sandy-loam soil, a good crop could have been expected by the carrying out of the gentleman's "hobby, deep plowing and thorough surface cultivation.

"Mechanic" gives us some wonderful statements of "facts" in regard to deep plowing. But he fails to tell us what kind of soil the facts grew out of, and only a partial statement of facts as to the seasons—whether wet, dry or average. In his concluding remarks he becomes somewhat mixed in his observations. In fact, he don't really know which is the best under all circumstances, but inclines to deep plowing for corn. That is well. Query: If "Mechanic" has farmed it for forty-two years, why call himself "*Mechanic?*"

But, to sum up the question of deep or shallow plowing, I will venture this assertion: No general rule will successfully apply to all kinds of soil. The farmer must consider, first, his soil; second, the season. What is good practice for A may be ruin for B. Farmers can settle the question only by experiments upon the land they work, and by close observations.

In reference to the tap root of the wheat plant, I will say that to call a man a fool does not make him one, and that the gentleman one mile from San Jose may put me down as one of the unpardonable mud sills, for, after forty-eight years of hard work, and some observations, on the farm, I fail to accept the wheat plant as belonging to the tap-root family. Therefore I have concluded to give my evidence in favor of Bro. Burrell's statement of facts. I believe he is sound on the wheat point. Bro. B. has a good subject, and I hope he will mine it "deeply." Yours, truly,

SAMUEL SPUEL.

San Jose, March, 1876.

[The above came too late for last month. We are pleased to see our farmers discussing this question, and hope they will keep good natured over it. Error is something hard to root out of the soil, but truth must stand on it own merits.—ED.]

FRIENDLY APPROVAL.

ED. AGRICULTURIST: The members of the People's Deliberative Association, in token of our thanks to the Editor of the California Agriculturist and Live Stock Journal, submit the following:

We take pleasure in recommending the California Agriculturist to the public as a worthy of patronage for its out-spoken and fearless manner of attacks on monopoly, rings and frauds of every character; and we regret that other journals will not do as much for the common good of the country. May the spirit of this paper be felt in the capitals of both State and Nation.

JOHN FORTNEY, Secretary.

Paso Robles, March 24, 1876.

REPORT OF THE COMMITTEE ON LAND MONOPOLY.

To the People's Deliberative Association:

We, your committee, submit the following report, and request its publication in the California Agriculturist:

WHEREAS, the people of the State of California have suffered from the unsettled condition of land titles, and all appeals to law have proved fatal to the settlers, and intimidating to other wishing to settle; and,

WHEREAS, President U. S. Grant of the United States, and the United States Attorney-General and the Secretary of the Interior, having set on foot a move to settle all land titles, which we believe will greatly advance the farming interests of California, and throw open millions of acres to actual settlers heretofore held by frauds, which frauds have robbed the Government of millions of dollars for which said frauds ought to pay heavy rents to the Government;

Resolved, That no bill has heretofore been recommended to the Congress of the United States so vital to good government as the settlement of land titles in California; and,

2d—That we extend our prayers to the great Ruler of the universe that He may endow our President with a competency of wisdom to execute his noble move and meet out justice to all parties; and,

3d—That it is the duty of every lover of liberty to sustain the President in this move, and as Washington was called "defender," so may we have full reason to call U. S. Grant DELIVERER of our State.

J. M. STONE,
D. G. WRIGHT,
Committee.

JOHN FORTNEY, Secretary.

Paso Robles, March 20, 1876.

TOKEN OF RESPECT.

[Published by request of the Committee.]

ESTRELLA SCHOOL DISTRICT, San Luis Obispo Co., Feb. 29, 1876.

We, as a committee in behalf of the patrons of this school, extend our most humble thanks to Miss Adella Madden, of San Jose, as a teacher, and for the kindness she has shown her students, the manner in which she has conducted her school, and her unlimited efforts in imparting knowledge to her pupils. We very much regret the closing of her school. Hoping prosperity will go with her, we freely recommend her as a teacher worthy of her high calling.

J. M. STONE,
D. G. WRIGHT,
WALTER GRAHAM,
JOHN FORTNEY,
Com.

Farm Laborers Here and Elsewhere.

It may be a matter of interest to some of our readers to know that, according to the last census, there are in this country 188,000,000 acres in improved farms, and 5,922,000 agricultural laborers; which gives about 31 acres to each laborer. California, in 1870, had 3,600,000 acres of cultivated land, and 48,000 agricultural laborers, an average 75 acres to the laborer. In England there are about 15 acres to each agricultural laborer, and in France 5½. In general terms, we may say, therefore, that one agricultural laborer works as much land in California as three do in the Atlantic States, five in England or twelve in France. This is a showing which may lead some Californians to boast of their State; but when we remember that the careful cultivation to which the lands of England and France are subjected, keeps the land as good as ever, while the lands of California are being constantly skinned and made poorer by a prodigal waste of the resources of the soil, we are inclined to think that it would be better for California if it had more agricultural laborers to the acre and had more labor and fertilizers put upon its soil. The fact cannot be denied that a great deal of the land in California is being rapidly worn out by a bad system of farming, and that the grandsons of some of the present tillers of the soil will have hard work to get a living on the ancestral acres, and will want to "go West," or give up farming.—*Napa Register.*

GOING TO THE SHOW.

We have always had a weakness—if weakness it is—for witnessing the wonderful maneuvers of good circus performers, and for seeing the wild and trained animals constituting a first-class menagerie. Man, the superior animal, exhibiting his animal powers and training, may be deemed by some to be below such as exhibit man's mental and moral qualities, ideas and sentiments. But while a sound physical body is essential to man's comfort and happiness and fullest development intellectually as well, an exhibit of physical training in a high degree, must be interesting to every student of mankind as well as to the mere lovers of sport. While we have always enjoyed the jollity and fun-provoking part of such performances, and have drawn quicker breaths at startling and amazing feats, we have also enjoyed the study in its more serious significance. And whatever others may think or preach we have never regretted either the time or money spent in witnessing such scenes.

As to an exhibit of animals, it is, or should be, as much a study as a matter of curiosity. The boy or girl who visits a menagerie should be given an illustrated book of animal natural history, and also a geography, and be encouraged to commit to memory the natures and habits of the various living things seen, and the country and natural characteristics of the country they inhabit. Who would not like to know what sorts of beings inhabit the planets? And yet how many will say it is silly to attend a show where many beings that inhabit our own planet, the earth, can be seen.

This train of thought has been suggested by the fact that the greatest show of animals and the finest circus ever upon this coast, viz., Montgomery Queen's is now making the tour of the State. If we did not approve of going to see such shows we should not encourage it.

The Model Farm.

As the large ranches are splitting up into smaller and better cultivated farms, the competition in size is exchanged for emulation in thoroughness. The very idea of what is called a "model farm," probably never entered the head of a Mexican ranch owner. How many miles could be ridden over without passing one's own boundaries, seems still to be more a matter of pride with some, than the less imposing, but more effective merits of order, thrift and comfort. The agricultural editor of the New York *Times* has, we think, hit the mark in a recent description of, and plea for model farming, and we can not do better than to give place to his remarks on the premium system:

It is unfortunate that the local, as well as the State, agricultural associations almost altogether ignore the cultivation of the soil in their competition for premiums. As the success of agriculture depends in a much greater degree upon the excellence of cultivation of the farms, than upon the size or beauty of the stock raised upon them, it would seem to be more conducive to the attainment of the ends for which these associations are supposed to have been instituted, that they should attract attention to this especial feature by offering premiums for the best ploughed field, the best crops, the best cultivated, best managed and best kept farm, as well as for the best horse, cow, hog, or trio of poultry.

☞ If you intend to do any mean thing wait till to-morrow. If you are to do a noble thing, do it now.

Household Reading.

MULTUM IN PARVO.

BY MRS. D. C. OUNN.

As strange as it may at first seem, there is no truer saying than this wise old Latin proverb, which, translated, means "much in little." A truth which is wonderfully illustrated by the workings of nature.

The little stream running by our door, tangling the sunbeams, laughing in glorious gleams, is but a drop compared with the grand old ocean, and yet the larger body of water could not exist without the smaller one.

The tiny seed sown by the farmer produces vast fields of golden corn and waving wheat.

The diamond is very small, and yet what beauty and brilliance flash from its crystal depths!

It is only after examining the little flowers filling the earth with beauty and fragrance, and noticing the delicacy of tinting that causes the rose to blush and the lily to whiten, that we realize that man could not create and sustain one of these little beauties.

History, as well as every day's experience, proves that many wonderful discoveries and important results have been brought about by humble means, showing that even in *little* there may be much. Sir Isaac Newton, lying listlessly in his garden, dreamingly looking up into the blue sky, is attracted by the falling of an apple, and anon he gives to the world the laws of earth's attraction or gravitation.

The simple fact of steam pouring from a kettle over the fire awakened thought and research, and to-day we have the mighty steam engine starting the echoes in the silent, sombre forests, or thundering along vast plains and valleys.

"To do and dare" to accomplish some grand and noble result seems to us many times well worth a life of struggle. So considering, we think there lies no glory in the quiet routine of every day life, nor honor in the well doing of humble tasks, and yet it requires more perseverance, greater diligence, for the accomplishment of these than of acts that are seemingly grander. It needs greater strength of character, more of true human principle, to bear patiently the petty annoyances, the little ills of life, than to undergo some great trouble or sorrow.

A smile, a kind word, a sympathizing tear, are little things in themselves, and cost us nothing, yet by them how many a desponding and weary heart has been gladdened and sent on its way rejoicing.

It was only a thoughtless jest, an angry answer, but it turned the soul of a fellow creature from the ways of pleasantness and peace into the dark, fathomless river of sin and wretchedness.

The artless questioning, or simple prattle of a child will often lead upward and onward one upon whom strong and forcible reasoning and earnest appeal have had no effect.

Many a man has been saved from ruin by the remembrance of a little prayer lisped nightly at a mother's side.

A tiny shoe, a golden curl, a withered rose, are each and all little things in themselves, and yet what dear, precious memories they may awaken; and how carefully do we treasure them if worn by loved and lost ones!

In the recollections of a friend it is not the greatest acts, the wisest sayings, that are to us the dearest; but the *little* deeds of kindness, the *little* words of love, spoken, perhaps, falteringly, from full hearts. Thus we learn that—

"Life is made of smallest fragments—
Shade and sunshine, work and play;
So may we, with greatest profit,
Learn a little every day."

REFORM UNDER CLOTHING.

BY ONE OF THE MOTHERS.

DEAR EDITOR: A March number of the *Rural Press* contains an excellent article from the pen of "Sister Colby" describing the combination suit for underwear invented by Mrs. C. C. Curtis, of 606 Montgomery street, San Francisco—the same that may be seen advertised in the AGRICULTURIST, which every housekeeper should read.

It has been my aim, ever since I became the mother of girls, to plan out and clothe them without the endless array of garments usually thought necessary, so that they might dress themselves in the morning as speedily as their brothers. Until the garment in question came under my observation, I never found any which combined everything necessary for comfort and convenience. Warmth equally distributed from neck to heels, looseness, with no strictures to keep the arms from being lifted over the head or the chest from expanding to the utmost. Surely Mrs. C. is a public benefactor, and I am happy to know that she is daily in receipt of orders for patterns, which argues strongly in favor of setting forth the desire among thoughtful ones for emancipation from prevailing customs. I am sure that any sensible woman would feel thankful to be emancipated from the uncomfortable styles of under-clothing, so constraining to breath and movements, that our mothers have handed down, even if they do not break through the fashion of exterior dress. And if American women were brave enough to adapt their outer garments to their needs without being severely criticised, there would be one less barrier to health, since those who have tried it declare that the prevailing mode of dress is a great hindrance to locomotion, whether indoors or out, ascending stairs, or stepping over pavements. The walking costume of some years back, when the skirt needed no lifting, was universally admired and thoroughly appreciated by the fair wearers themselves; still it was permitted to pass out of style. Such a dress, with flat trimmings instead of the flounces and knife-pleatings now so popular, is recommended for a home dress for those having active household duties to perform.

At the sea side, where sea-bathing is one of the summer pleasures, the custom prevails of wearing the bathing dress on picnic excursions or to camping parties. Nothing can be more suitable than the loose blouse, confined at the waist with a leather belt or sash, and pants of the same material, closely fastened at the ankle over a neatly-fitting boot. A long skirt is often worn over this costume, in going and coming, to avoid being conspicuous, as well as for warmth. The fatigue of walking is very much lessened by wearing a single skirt, and that so short as to be not a hindrance, as all admit who have ever tried it; but then it is so ungraceful, and trailing skirts, falling in folds, are so becoming to lovely womanhood—"even though," says the health reformer, "they entail untold misery upon coming generations."

[We append an extract from Mrs. Carrie A. Colby's article above referred to.—ED.]

EMANCIPATED.

I am the happy owner of two new dress reform suits, and am, this moment, blessing the clever originator, Mrs. C. C. Curtis, of San Francisco, and if anybody will procure patterns, sit down and make one suit, put it on, and not spoil the effect by tight corsets and heavy skirts, I will guarantee that she will trip about, mentally exclaiming, at least, as I did, "Emancipated!" "Eureka!" or anything else that will express the sense of lightness and comfort that, to me, was an altogether new and grateful experience.

I had before worn some half-way hygienic garments, but here were three in one, waist, chemise and drawers, cut to measure, neat-fitting and altogether elegant, such as the most fastidious might not despise. A full suit of flannel first covers the body from neck to heels, and over it is a cotton garment that perfectly fulfills the requirements of the three before mentioned.

This will be appreciated, first in wearing, being quickly put on, and oh, so comfortable; next, in the laundry, whether at home or away in the hands of the "heathen Chinee," and lastly, in making; for although tucks, ruffles and puffs may be added, the design of the garment doesn't invite them.

I remember that "Mary Mountain" made certain strictures in the matter of having this artile of dress in one piece, but the objection doesn't obtain here, because, good friends, (sub rosa), we don't have *floas* in Butte county.

And now having taken myself out of the way as a stumbling block to my neighbors and friends by my good example, having tested the patterns and experienced, in part, the benefit arising from them, I am free to maintain that every woman who reads this is not guiltless if she neglects to avail herself of the opportunity now afforded her of obtaining cheap and excellent patterns of healthful undergarments (unless she already wears those equally good), and thus saves to herself and friends the remnant of health that the present style of under-wear has left to her.

Mrs. Curtis recommends that the outside garment be made of Canton flannel, or twilled cotton, so that it may the better pay for making, and as I stitched "seam, gusset and band," I found myself wondering if it wouldn't be in one respect at least, like the "one-hoss shay," not indeed that it was likely to last "a hundred years to a day," but the inventor had make it "so like in every part,"

"There wasn't a chance for a stitch to start."

So that after good old-fashioned wear it will fall to pieces in a heap or mound.

"All at once and nothing first,
Just as bubbles do when they burst."

I remember that a sister inquired, during the Matrons' meeting at the State Grange, as we pored over the hygienic dolls' garments, (which were those I have been describing in miniature) what we should do with our present stock of underwear. I didn't quite know then, but having found out what I shall do with mine, I give you the benefit of my wisdom. My very best I shall preserve to be exhibited at the Centennial exhibition, 1976, as a relic of the dark ages, which they almost begin to seem already; the rest I shall keep for emergencies, and by all means never make any more.

I must not forget that I wanted especially to say, that perhaps the reason many have not already adopted this new fashioned underwear, is because they were unable to learn where the patterns could be obtained.

It would be funny to relate my experience on this score, and if I hadn't thereby realized that others might profit by it, I should hardly have written this sketch at all.

In the varied and absorbing matters that drew our attention at the State Grange, I failed to secure the address of Mrs. Curtis, consequently, when I got settled down at home again, and desired to use the patterns I had so much admired, I was obliged to first lay Sister Dewey under contribution for the needed information. Sister Carr was next interrogated as being headquarters, in a certain sense—being the exhibitor of the doll at the Grange. There being several Mrs. Curtises, the right one was at last found, when it turned out that a certain Mrs. Dr. C. had charge of the patterns; but on applying to her we were once more referred back to Mrs. Curtis aforesaid, for patterns of the required size.

It did seem a good deal like "red tape" didn't it? or Dickens' "how *not* to do it," but it really wasn't, at all; and at last the coveted package came by mail, with a note from the inventor saying she had been obliged to project the patterns upon an entirely new scale. Could it be that I had made a mistake in one of the measurement? Yes, surely, in giving the hight in inches I had represented it to be about eight feet. Here was a figure to make the gravest of our ancestors smile. Eight feet tall and 24 inches around the waist! We had a good laugh as the ridiculous picture appeared and reappeared before our excited imagination, and wondered if Mrs. C. didn't think some of the children of Ank had become "matarialized" up here in Butte county. So here follows the kernel of the nut that has required so much cracking, to wit: the full address of Mrs. Curtis and measurements required in sending for patterns:

"Mrs. C. C. Curtis & Co., No. 606 Montgomery street, San Francisco, room 31.

"The first measurement should be from the highest point on the shoulder seam to just below the knee cap; second, the size around the bust; third, around the waist; fourth, length of waist under the arm; and fifth, length of drawers on the inside seam to just below the knee." Price of pattern for flannel, 25 cents; for cotton ditto, 35 cents, and 15 cents postage if sent by mail.

Now good friends, lovers of humanity and reform, won't you all give these patterns a fair trial and test the virtue of a "sure enough" dress-reform garment.

[Mrs. Curtis is now making three different patterns of under clothing, viz: the "Combination Suit," three pieces, 25 cents; "Excelsior," six pieces, 35 cents, and "Close-fitting," ten pieces, 40 cents. Ladies near San Jose can see samples of underclothing and patterns by calling upon the wife of the editor of this journal.]

GRANDFATHER'S LETTERS---NO. 8.

INGLEWOOD'S REPLY TO AUNT MARY.

Dear Aunt Mary: Your very courteous, candid answer to my last letter encourages me to further open my mind to you on that subject my heart dwells upon so much. Between us there seems great union of sentiment, and I think the soul affinities to which you allude will be found to be as compatible as are the physical. True, we know little enough what the soul is, separate and distinct from the body. That it continues to exist, I do not doubt, so do not be afraid of ever finding me a mere materialist. We find a vast difference in the conditions of people in this world, and who knows but there may be as great a difference in the next? As in this world, what is really essential to our well being de-

pends very much, or mainly, upon our selves, on a parity of reasoning, may we not expect it to be so in the other?

As I told you before my pleasures are not in the club-room or ostentatious show, so I will tell you now in what they do consist. First, and primary, in the successful prosecution of that business by which we live. Though this belongs to the physical, its success is equally important for the soul's well-being—indeed, for the whole man. Then, next in importance, I deem a polite, kindly courteousness of demeanor and manner when I come into the house, making a special effort to leave trouble and vexation behind, till an opportune time arrives to give expression to these things. The cultivation of a taste for certain things I deem important, not physical tastes, but intellectual, soul tastes; and what a vast range for its exercise! In the book department, a taste for history, biography, science, religion, theology, and the general knowledge to be attained only through reading. Oh! how I wonder at the young finding time to spend over a billiard table. Then, again, I do love to have and cultivate a taste for those beauties of nature we often see surrounding the porch and garden; also, those other beauties of art that are made to decorate the interior. Why, in some houses we go into, beauty covers the walls, and nothing but beauty emanates from the lips in the shape of polite, courteous language, in having something to say, for these tastes and their cultivation promote our conversational powers. They give us something to think and talk about. But what food does an evening spent over a billiard or card table give us for thought and conversation? Not our very nature has a craving for society, from earliest childhood to old age, and if denied or restrained from that which is ennobling and elevating, it is apt to have recourse to the contrary—that which is debasing. And why cannot we have more houses and families of the higher type upon which my mind's eye now rests? We could, I think, by timely care and cultivation. For such I am an advocate. Who will come to my assistance? Will the darling Augie?

Such, dear Aunt Mary, are my soul's cravings and desires. This and the words of a former letter will include the physical, the intellectual, moral and spiritual. Congenial, suitable exercise in all these departments of our nature, and in congenial, suitable companionship; and who will not say there is a possibility of a little heaven here below.

One word of that masculine supremacy to which your letter refers. It is to the husband's home and business, style and mode of life the wife always comes, hence *he* only is competent to judge how far he may deviate from that course. But never fear, Aunt Mary, as long as the love principle is kept all right on both sides; that is the great compensating regulator in domesticity.

P. S.—Dear Aunt Mary, you perceive the confidence I place in you. May I hope, through your mediumship, to make a favorable impression on the heart of dear ma and the beloved Angie?

Your true friend, INGLEWOOD.

LETTER FROM MOUNTAIN HOME

BY AUNT PEGGY.

Twenty miles in the mountains, one thousand feet above the ocean, mountains of the north, south, east and west sides, in the basin, is one of the finest and loveliest little mountain-valley homes that can be found in the State—a place that literally flows with milk and honey. Here lives your friend.

Many have asked the question, "How do you content yourself, and pass away the time, so far away from neighbors and society? I should die with the horrors." I answer them, that I have my children to care for, my household duties, my family sewing, honey bees, home dairy, fruits of all kinds, plants and flowers, and my little chickens, and little kids that are orphans, and a great many things that are too numerous to mention, and last of all, "there is no place like home!"

This is Saturday afternoon. The week's work is finished, children dressed, faces washed, etc., and as I feel that I would like to sit down and rest until time for tea, I take up the last number of the CALIFORNIA AGRICULTURIST, read over the communications, familiar talks, letters from boys and girls, and it almost seems as though I was reading letters from far away friends. I am glad to see our boys and girls take so much interest in trying to make the paper more interesting. I think the Editor very generous in giving you a "Corner" for your little mite. And I think when we have such a sociable and valuable paper within our grasp, it is the duty of every subscriber to do all they can to keep it up and make it interesting for both old and young.

I have been pressing ferns and flowers, and so successfully that I really feel proud, and will tell you how I dry them so that they will retain their natural colors. I take a box, any size (not too large, of course), cover the bottom with fine, dry sand, put in a layer of flowers and a layer of sand, alternately, until the box is full; then let them remain until I think they are dry enough; then take them out and spread before putting them in books. I hope whoever may try this will be as successful as I have been.

PASSIONS.

A SCHOOL COMPOSITION, BY MAMIE.

To subdue the passions of creatures who are all passion is impossible. And what are these passions which make such havoc? If you permit your passions to govern you, instead of your governing them, you destroy your vital powers. A wise man governs his passions; but a fool permits his passions to govern him. The passions are modifications of self-love. The preservation of man is the center toward which all his affections and all his actions converge; he inclines strongly toward pleasure, and he avoids everything that can injure him. Pleasure and pain are the elements of all the passions, which may be reduced to love and hatred. Pleasure is only momentary. We judge of it by its intensity. Its duration establishes happiness. The greater the pleasure a person experiences, the greater the apprehensions which he has of being deprived of it. The mind is immortal, and full of undying thoughts and conceptions. The stream, when it descends slowly with a hoarse murmur from the mountain, ripples through the plains and adorns and enriches the scene; but when it rushes down in a roaring, impetuous torrent, overflowing its banks, it carries devastation and ruin in its course. So, when the passions, appetites and desires are kept under due restraint, they are useful and fulfill the intentions of a wise and overruling Providence in performing a part of our nature; but when they are allowed to rage with unbridled fury, they commit fearful ravages on the character which they were fitted to adorn and exalt. If we wish the stream of life to be pure, we must preserve the fountain from whence it flows unpolluted. And to enjoy health and long life, the passions should be kept under due control; for they may be considered the moral thermometer that regulates the system and holds the most powerful influence over the general health and welfare. Our passions, when controlled, are the genial warmth that cheers us along the way of life; ungoverned, they are consuming fires.

San Jose Institute, April, 1867.

IMPROVE THE COUNTRY HOME.

BY A FARMER'S WIFE.

Why are our young people so ready to leave the country home and seek a livelihood in the city or town? Is it not because science and art and civilization are there most rapidly developing, and amusements and entertainments are more enticing? Those of our young people who can be spared from the farm to enter these marts of education are seldom induced to come back and lead that blind, dull, monotonous life in which we country people are plodding. Then I say we must *educate for the farm*. We must bring more science, art and literature into our homes—take and read more good books and papers. Let the genius of intelligence shine in the kitchen and embellish our lives.

The little country girl of eight or ten summers, by a simplified form of botany, can be made to see much more beauty in the lovely wild boquet she gathers than she does to-day; and the middle-aged, or hoary-headed man need not plod along in uncertainty from ten to twenty years on his farm before he knows to what kind of growth his soil is adapted, but he may, by the science of chemistry and practical experimenting, unfold the nature of the soil and plant and cultivate rightly that which is adapted to its conditions. Then will there be inducements on the farm for the young man and for the young woman. Harvest will yield more abundantly with less labor. We will not hear the continued cry, "it don't pay," when knowledge takes the place of ignorance in our labors. There will be more recreation for all, more home embellishments, and our young people will not look like old men and women before they are mature.

There are many helpers at work to bring about this result for the laboring agriculturists, and the best thing the farmer can do is to resolve to progress and make his farm home more attractive and himself more intelligent. Remain organized as you are in the Grange, I would say to every farmer, and by co-operation help to "paddle your own canoe." You cannot reach a more ready road to mind improvement than to patronize the best periodicals, and jot down your daily thoughts upon the many, many subjects about you. It may come a little hard at first, but it will grow easier each time, and will be greatly to your benefit.

EVENINGS AT HOME.

BY HOUSE-KEEPER.

It is one duty of parents to devise means for making the evenings in our country homes pleasant and profitable for our children. If they find enjoyment at home they will not be so much inclined to seek it elsewhere. Of course, when we live several miles from town, we have not the opportunity of attending lectures and other entertainments which we as well as our children could enjoy. Therefore we must look for other means of entertainment.

One very pleasant way of spending an evening is by reading aloud. Let each person present read a short article. The children can select from books suited to their age and capacity. This practice will be found of great assistance in making the reading enjoyable as well as beneficial to the entire household.

There are many games which are very pleasant, among them, chess, checkers, and backgammon; also, many games of cards, among them the popular game of authors, which is very interesting and instructive as it makes us familiar with some of the names and works of prominent authors. All of these games are not only harmless, if properly indulged in at home, but are useful in cultivating the memory and disciplining the mind, but principally in affording such amusement at home as will keep the young folks from wanting to go elsewhere.

There are very many ways in which instruction and amusement may be combined in spending our evenings at home in the country.

A MID-NIGHT RIDE.

BY "JOE."

I was in a very new mining district. The reputed richness of the mines had attracted a large number of prospectors, and with the rush came the "slum" of followers that are almost inseparable from such excitements. Our mine was the only one fairly at work, and the only one whose mill was in operation. Other mills were in course of construction, and the reputation of the assays in San Francisco of our rock had made this—the first run of our mill—a subject of universal interest in the district. The clean-up was made on Saturday, and big reports had leaked out of its grand result. It was only a week's run, and the mill was a single battery, with limited conveniences outside of the battery for amalgamation, etc., bearing about the same relation to the present style of quartz mill as a jewsharp to a piano. However, It was a big thing for our district, and the run had been watched and commented upon and the result prophesied was one calculated to throw Washoe (which was then the generic term for the Nevada Territory mines) quite into the shade.

Of course it was desirable to get the result of this first run to San Francisco as soon as possible, and, as the condition of things was a little shaky as to the security of the road, etc., it was a serious question how to solve the problem.

A military express was running from a neighboring United States Indian post, and the arrangements were made to have the yellow bullion carried by their "vidette" to the nearest express office: but the post was some twelve miles distant from the mine, and a dangerous road lay between it and our mill.

Tempted by the madcap ride, I offered my services to carry the bullion through by night to the post. The superintendent of the company eagerly accepted the offer, and sober second thought found me saddled with an errand which threatened a little personal danger and a good deal of personal discomfort. However, I wouldn't back out, nor show my misgivings; so, about midnight, I set out on my lonely ride, mounted on a white horse well known in the district, with saddle-bags carefully secured and filled with the bullion, and a Colt's dragoon pistol in the holster. I felt the excitement that a spice of danger always gives to such undertakings.

After crossing a ferry at the start of

the journey, the road lay through a long stretch of plain dotted by sage-brush and grease-wood and crossed by two streams, on the margins of which cotton-wood tried to grow, and succeeded so far as to make the roadside quite like chapparel.

All was quiet, save the sound of my horse's feet as he went off on a round trot, until after crossing the first creek.

Soon after getting out of the thicket which the stream encouraged to grow, I heard the sound of another horse following rapidly. To say I was thoroughly alarmed, is probably a mild way to put it. However, I concluded to make it a question of speed, and striking my spurs into old "Whitey," we commenced our race.

"This chap," I thought, "intends to come up with me, if possible, at the next creek, where the undergrowth is thicker, and I must beat him there." So I urged my horse to his utmost speed.

Away we flew through the gloom; but the sound of the pursuer come nearer. No use to look behind. I could only see some fifteen feet about me, and that but indistinctly.

On I went—the perspiration dropping from my forehead, and on patting my horse's neck (urging him in a low voice) I found he, too, was feeling the pace.

Still the pursuer gained. From the break-neck pace at which we were going, there could be no doubt of his intentions.

The line of shrubbery of the second creek could now be seen dimly through the darkness, and almost immediately the stream was reached. Through I dashed—a gleam of hope that my pursuer would stop, making me feel a little elated.

On regaining the hard road once more, I heard my pursuer nearer than before. I was doomed, I thought; but I was going to make an effort for it, even yet. I loosened the saddle-bags and grasped my pistol. The pursuer was close behind. Throwing a glance backward, I could distinguish his dim outline merely closing up the gap between us, his horse breathing heavily. Kicking my feet from the stirrups, I swerved sharply from the road, dashed into the sage-brush, and pulled up, ready to leap from my horse with my saddle-bags, and giving him a blow, send him off riderless, hoping to deceive my pursuer into the belief that I was still upon him.

As I cleared the road my pursuer flew by, unable to turn as quickly as I had done, and you may imagine my feelings when I found it was—*a riderless horse!*

It seems some of the horses of the company of cavalry stationed above had got loose, and they were so used to the drill of the camp that, while loose in pasture, they would often join in the mount-drill, and I suppose this fellow was just amusing himself by "following suit."

I got over my scare, but never told before this adventure of my "midnight ride."

Jesse D. Carr, of Salinas City, recently lost his fine young bull, "Sixth Lord of Oxford," which has been known throughout the State as the finest blooded bull in the country. He has taken the first prize at every fair he has been exhibited at, and arrangements had been made to the Centennial this summer for exhibition. Mr. Carr has been offered on several occasions $12,000 for the animal.

The religion which is to save the world will not put all the big strawberries on the top, and all the small ones at the bottom.—*Ex.*

Stock Breeder.

MODERN CATTLE FARMING VS. THE ONE-CROP SYSTEM.

BY COL. COLEMAN YOUNGER.

THE following paper was prepared by Col. Younger to be read before the California Short-horn Cattle Breeders' Association:

It is held by the most experienced farmers in the older States that breeding of Short-horns, or grading up our common cattle in connection with farming is the most profitable farming.

I propose to discuss the latter proposition at some length. In some portions of this State farmers are beginning to realize the fact that to cultivate our virgin soil from year to year in wheat or barley, will ultimately impoverish the land to such an extent that the yield will be below a paying crop.

It is a fact that formerly our best lands would yield from 40 to 60 bushels of wheat per acre, and from 60 to 80 in barley. What is the condition now, after twenty years of continued cropping the same lands in wheat and barley? It is considered good cropping on this same land if it yields from 30 to 40 bushels in wheat and from 30 to 50 in barley per acre. Now, the American people in any other State but this would long since have changed this mode of farming. But our misfortune is that we want to strike a bonanza in every crop we raise, and keep trying, on the same principle from year to year, until our lands are ruined, and we then have to adopt a new mode at a great disadvantage.

In that portion of California where the soil was light from the beginning, after sowing their land in wheat for some years, they found that they would have to adopt a different mode or give up farming.

The practice now is to summer-fallow one-half of their farming lands, and the result is that the one-half produces more than all did under the old process. Now, let us consider for a moment where the profit comes in. Let us suppose the farm to consist of 200 acres, under the old mode; these 200 acres have to be plowed, seeded and harrowed; the reaper will have to go over all the ground. Now, to get at the cost, count up what the seed will cost for 100 acres—plowing, harrowing, reaping and threshing—and you will realize the amount of money lost every year. But, under the new mode, all this is saved, except the summer-fallowing. This of itself is a large saving, and should be reckoned as clear gain.

Now, I contend that there is still a more profitable mode of farming, which must be adopted sooner or later, and that is to combine beef-raising with other branches of farming. All farmers ought to and most of them do own a number of common cows. Suppose every farmer would keep as many cows as a third of his cultivating land would keep well, and breed them to a Short-horn bull, what think you would be the result? To come at this we will suppose the farm to be 200 acres; a third of that would be 66⅔ acres, allowing two acres to each cow. Now allow these cows to produce thirty calves, and to suckle the same. Having ample pasture, at twelve months of age they will average in this climate a thousand pounds, of the most delicious and high-priced beeves. These thirty calves will bring at least $1,500. The resting of the land and the droppings are invaluable to the soil—far more so than summer fallowing. I am only estimating one-third of the land in this proposition. It may be said that this number of cows will cost quite a sum of money. It can be truthfully said that the cultivation of the extra hundred acres will dost much more than the cows. In the first case there is but little expense connected with the raising of the calves; the purchase of the bull is the only extra expense. Young Short-horn bulls of superior quality can be bought of reliable breeders in this State at from $150 to $500. If these propositions are true and are practicable, and I think they are, why have not the farmers of California long since adopted this mode of farming?

There was a time in this country when there were good reasons for not adopting this course. But few farms were fenced; the country was full of cheap cattle; they roamed over the plains by thousands, and our people hoped to make a large fortune by some chance speculation and leave the country for their old homes, not realising that this was the best farming and stock country in the habitable globe. The failure of thousands to make fortunes by mining, and not having means to take them out of the country, compelled them to cultivate the soil. This fact has developed the farming resources of California. These hardy pioneers were quick to learn that there was large and quick fortunes to be made in raising wheat and barley, and the owners of large ranches, with their tens of thousands of Spanish cattle, had as good a thing as they wanted to furnish Spanish beeves for the wheat-grower and other non-producers. These cattle kings could not be induced to use Short-horn bulls. They said what they lacked in quality they made up in numbers.

The drouth in 1864 made sad havoc of these cheap cattle. Large ranches, that counted their cattle by the thousands, could no longer count them by the hundreds. After these vast herds were destroyed, the owners of these large ranches were unable to again stock them as before, and of necessity they had to be divided up into small tracts, and sold for farming purposes.

Then the mania for making fortunes in raising wheat continued, and this constant wheat-growing has been tried until some of our largest farmers are involved to an enormous amount. This insane policy of taking such desperate chances from year to year on a single cropping will, if persisted in, bankrupt any farmer. What sense is there in cultivating thousands of acres, and handling hundreds of thousands of dollars every year, only to come out behind four years out five, and ultimately to fail with all your energy? Will sensible farmers from these desperate follow up this ruinous policy, hoping against hope, to make a great fortune on a single crop? Or does it gratify their vanity to see their vast farming operations spoken of in the papers? Is this a compensation for the great losses sustained by many? But few are aware of the great struggle, the anxious moments, the fear of failure, the hope of success that alternate in the minds of these large farmers, when perhaps their all is staked on a single crop. This inward struggle, these inward moments of despair are concealed from the papers and the world, at least for a time.

We are compelled to turn from this class of farmers, for they are joined to their idols, and to discuss the beef question with the small farmer. We are glad to note that a great change has taken place on this coast. In the last few years hundreds of our farmers have adopted the mixed mode of farming. Some have started a small herd of Short-horns and are doing well, but much the larger portion have bought young Short-horn bulls and are grading up their common cattle. As a general proposition, there is more money in this course than the other, for any farmer, I do not care how small his means are, can buy a young Short-horn bull and commence.

There is so much to encourage our farmers to improve their stock, to raise better beef, that I am inclined to think that if Short-horn breeders' experience and practical information were diffused more fully among our farmers of breeding, raising and feeding of Short-horns and grades, it would induce hundreds to add that to their other farming. The great increase of the consumption of beef in America and England in the last twenty years is so marked that there can be no mistake in embarking in the business.

In a few years we will have cheap transportation to the Atlantic States and to England. Then all the beef from Nevada will be shipped East, and we will have California to supply. The great supply for the Eastern market is driven from Texas. When that is exhausted, which must be in a few years, where are the millions to get their supply from?

It is a noticeable fact that Yankee ingenuity is now being taxed to construct vessels, that fresh beef can be shipped to England and to all Europe to feed their millions of hungry inhabitants. Breeders should bear in mind that it is the quality and not the quantity which gives the greatest profit. Prime beef commands ready sale at good prices when inferior beef is a drug in the market.

If our farmers needed encouragement to grade up their common stock, they would get it by visiting the herds of Lux & Miller. These gentlemen have been in the business for more than fifteen years, and they now have the largest and finest herds of Short-horns in this or any other country. Then there is Walsh's estate in Colusa county; Martin, James and Daniel Murphy of Santa Clara county, and Emerson of San Mateo. Across the bay, the Page Brothers, Chapman of San Francisco, Carr of Salinas, who has a large ranch of grades in Oregon. All these gentlemen have fine thoroughbreds. You may say these men are of great wealth, and can afford the outlay. So they are; but I will now mention a few out of the many who are called small farmers who have been in this business for years, and have made it a success. In Santa Clara Valley I find Quinn, Reardon, Clark and Thompson, and there are many others in all portions of the State. To see these herds of grades and learn the amount of money they have realized from them, would give great encouragement to young breeders. To improve our stock and increase their value for feeding the human family, is one of the duties of the Cattle Breeders' Association.

A good reputation in business affairs is of the first importance to any farmer, and especially to a young farmer. A reputation for being a grower of first-class fruit is worth as much, yea more, than the crop itself, if such a comparison is permissible. A farmer noted for growing fine fruit and for putting up nothing but fine fruit for market is always in market at highest rates. Indeed the market seeks him and pays him a bounty for his care and honesty. A good reputation is a good thing. A farmer who grows fine wool and cleanses it in the most thorough manner, and offers nothing but wool, is known among all manufacturers through their agents, and his product is worth a premium. His reputation makes him a market at his door.—*Detroit Tribune.*

Boys and Girls.

Totty's Arithmetic.

One little head, worth its whole weight in gold,
Over and over, a million times told.

Two shining eyes, full of innocent glee,
Brighter than diamonds ever could be.

Three pretty dimples, for fun to slip in,
Two in the cheeks and one in the chin.

Four lily fingers on each baby-hand,
Fit for a princess of sweet Fairy-land.

Five on each hand, if we reckon Tom Thumb,
Standing beside them, so stiff and so glum!

Six pearly teeth just within her red lips,
Over which merriment ripples and trips.

Seven bright ringlets, as yellow as gold,
Seeming the sunshine to gather and hold.

Eight tiny waves running over her hair,
Sunshine and shadow, they love to be there.

Nine precious words that Totty can say,
But she will learn new ones every day.

Ten little chubby, comical toes,
And that is as far as this lesson goes.
—[St. Nicholas.

What Would You Think?

When walking out some summer's day,
What if a little bird should call,
And on your shoulder perch and say,
"Speak well of all, or not at all."
What would you think!

What if you chased and caught for fun
An airy, gaudy butterfly;
And on its wings there in the sun
You plainly saw the words "Don't lie"
What would you think!

What if you watched an opening rose
Spread all its petals to the air,
And to your wondering gaze disclose
Two little warning words, "Don't swear!"
What would you think!

What if you sought to rob the birds,
And hunted for their nests with zeal,
But found each egg traced o'er with words
As plain as print, "Dear boy, don't steal!"
What would you think!
—[Independent.

"OUR CORNER."

DRAW near, children, and listen while Aunt Polly tells you of a sweet child who has passed away from earth — a precious bud snatched away to bloom elewhere. The mother's hands have dressed that little form for the last time, and away out of her sight have they carried her babe, in its flowery bed, away to its silent resting place. She was an only child. The sole object of affection almost idolatrous, of both parents and a wide circle of friends. Less than two years had she dwelt upon earth, yet many of more mature years pass away leaving behind fewer to mourn. Her beauty and winning ways endeared her to all, and never can her place be filled.

Each one of you, little ones, bears the imprint of angelhood. This world would be a dreary place were there no children. But kind, lovely, gentle children are the ones whose presence we all enjoy. Remember to think of others always before yourselves. Try to do something each day to render life happier to those you love. And when restless or impatient, remember the lesson breathed forth in the patient lily of the valley, and fragrance of the hyacinth always scattering joy. Think of the silent form enshrouded in lace, decked with the hyacinth and lily of the valley —emblems of purity— and hold your breath, lest you offend.

A life ended. A mission fulfilled. Our only solace in this trying hour is, that she has passed beyond all suffering, and and we would not call her back to a life so full of trial and disappointment as this life is to many of us. The lesson taught by such bereavements we all must learn, and if, as children, you patiently submit to the will of earthly parents, you will, in time, become submissive to the Higher Will.

And now, my little nephews and nieces, see what a funny story is sent us by our good friend, M. E. T.:

When little Annie was three years old, she went with her papa to witness the ceremony of baptism by immersion. A large and clear stream of water was chosen for the occasion. Annie stood where she could see all that transpired, and as the parties were taken to and from a watery grave, her little face grew thoughtful. On reaching home, she asked mamma why they put the people into the water. Mamma scarcely knew how to answer one so young, so she simply said, "To make them better." Annie was satisfied: what mamma said was always true. On the following day Annie was seen very busily engaged at something about the pool of water where the chickens drank. Papa, on going out, found two tiny kittens, dripping with water, and almost drowned. Knowing how fond and how kind was her usual manner towards her pets, he said, "Why, Annie; would you kill your little kittens?" "O, no, papa, I'm only making them *better* kittens."

Now for our letters.

HOLLISTER, March, 1876.

Aunt Polly: I am eleven years old. I have guessed the enigma; it is O. I have made out Jennie's rebus, too; it is Air. I have formed 54 words from the word "carpets." I will give you a list of them. A. E. POOL.

Glad you have written, and hope to hear from you again. May-be you will beat next time.

And this from amidst the snow-capped Sierras:

SIERRA, April, 1876.

Dear Aunt Polly: I like the little folks' Corner so well that I thought I would write you a few lines, though I am afraid you will not think my letter very interesting. Perhaps you will be surprised to hear from your little niece that lives way up in the mountains, where the snow has been up over the fences this winter. I have been trying how many words I could spell from "carpets," and send you 60. I am eleven years old.

Good-bye. LIZZIE H.

Aunt Polly remembers when she was a little girl, and lived where there is lots of snow in the winter. It was very cold sometimes, but we had splendid fun playing in the soft snow and sliding on the hard, glaring ice, when we went to school. It is just as good for girls to play out of doors as for boys—so Aunt Polly thinks.

Alther Feldman, San Jose, sends the answer to Jennie's rebus and 83 words from "carpets."

ANTIOCH, March, 1876.

Dear Aunt Polly: Noticing a request in the AGRICULTURIST for the young folks to try and find how many different words could be made out of "carpets," I thought I would try, and I succeeded in making 167 words. Yours, truly,

GEO. W. FULLER.

Here is a letter from Lompoc:

Dear Aunt Polly: I am fourteen years old. Do you think I am too old to be a cousin to the little boys and girls that write to you? I see in the last AGRICULTURIST you requested the boys and girls to see how many separate words they could make from the word "carpets," so I thought I would try and see how many I could get. I got 241; all the words I could think of and find in books and papers, and then took the dictionary. I don't know as that was right, but there was nothing said about it, and mother said it would do no hurt, and would teach me to spell. I have made a puzzle which I will send to you, and if you think it good enough, I would like to see any of the cousins make it out.

CHARLEY TUCKER.

Yes, Charley, it is good drill to find the words in the dictionary and learn to spell. You are not too old to be Aunt Polly's nephew. She is glad that you have written, and hopes you will remember to do so again.

Here is Charley's puzzle. How many can guess it?

My first is in paint, but not in ink;
My second is in rose, but not in pink;
My third is in make, but not in wake;
My fourth is in sleep, but not in lake;
My fifth is in see, but not in talk;
My sixth is in run, but not in walk;
My seventh is in stake, but not in log;
My eighth is in snake, but not in frog;
My ninth is in track, but not in trail;
My tenth is in fence, but not in rail;
My whole is a thing which we all should love.

Here is a cross-word enigma sent us by a good friend, and we guess it will puzzle our pets to make it out:

My first is in apple, but not in plum;
My second is in go, but not in come;
My third is sa sister, but not in brother:
My fourth is in mother, also in father;
My fifth is in love, but not in joy;
My whole is loved by every boy.

MOUNTAIN VIEW, April, 1876.

Dear Aunt Polly: I send my list of words from carpets. I have 359 words. I like the AGRICULTURIST very much.

Good-bye. CHARLIE SPRINGER.

Well done, Charlie. You have dusted the "carpets" pretty thoroughly, and have beat for the chromos.

A welcome to our little niece clear away in Ohio:

LA GRANGE, Ohio, April, 1876.

Aunt Polly: My own Aunt takes the AGRICULTURIST, and I have read the letters of the little boys and girls, so I thought I would try. I have a colt named "Dotty Dimple." It is not old enough to ride yet. I have a shepherd dog. His name is "Pluto the Fourth," and he can sit up and cross his paws, walk along on his hind feet, roll over, and do many other tricks. This is all you will want to read, I guess. Please print this letter. From your friend.

ANITA JOHNSON.

Thanks to all who have tried to get all the words they could from "carpets." The question now is, Who is entitled to the pair of chromos, the "Chicks" and "Birds"? Aunt Polly has found out 536 words, which beats all, but then she does not expect to keep the chromos, although she wishes some one else had beat her. It is not impossible to do it. I notice two mistakes in Charlie Tucker's list. He gets "tartar" in twice. Did you ever hear the story about catching a Tartar? Look out, Charlie. The other false word is "parrot." Where did you find your "o," Charlie? But we will not scold you; 239 is not a bad number. You are next to the head, and came near beating, but Charlie Springer's list contains 359 words, and only one mistake. There is no such word as "setas," but probably you meant "setæ,"—the plural of a word used in botany signifying like a bristle. Charlie Springer gets the chromos this time. His is the largest list received up to the 15th of the month, which is the latest moment the Editor will allow Aunt Polly to hand in copy to the printer. But should any other niece or nephew send a larger list, chromos will be sent to them also.

It would occupy so much space to give all the words found in "carpets" that the editor objects giving room for them.

Now what puzzle can we think up that will test the studious powers? O, I have it now: the three boys and girls that will send in the most names of mountains and rivers found in the Pacific States and Territories—west of the Rocky Mountains—shall have, each, a pair of chromos. To give all a chance I will grade the ages. The one under ten years who sends most names shall have a pair; the one under twelve years another pair, and the one under fifteen years another pair. Now, how many will try? Three chances to win and nothing to lose, for you will learn something by trying at any rate. The names shall be printed and due credit given, and Aunt Polly gives to the 10th of June to try in.

GRANDMA'S TALKS.

Easy Lessons from Nature--No. 4.

Good morning, children. Why are you looking so merry, Johnny, while Lucy is half crying and very much annoyed in spite of her span clean dress and pinafore? Does "thereby hang a tale," as the boy said of his kite?

Oh! indeed! Johnny is quite ready to tell how lucy went to draw up the kitchen window shade and unexpectedly sat down in one of the pumpkin pies which Sarah had just got ready for the oven. That accounts for the smiles, but not for the tears. Better a cold pie than a hot one, eh, Lucy? Oh, never mind Johnny's poor jokes. Let him sing all day if he wants to, "Sarah made a pumpkin pie, which Lucy turned to squash." It was a funny accident, and we will turn it to some account by taking our lesson from it to-day.

I fancy, Lucy, that a great deal of that pie changed its place suddenly when you sat down upon it, because there is a law in nature which prevents two bodies from occupying the same place at the same time.

Can either of you tell me of any two things which seem to occupy the very same place at once?

Johnny thinks he can drive a nail into wood without changing the atoms of wood, but let us pull the nail out again and there is a hole the size of the nail, showing that the particles of wood have been jammed out of place just as the pumpkin was jammed out of the plate.

Lucy, dip your finger into the water in this full glass. Doesn't your finger displace some of the water as it goes in? Yes; see how it flows over the top of the glass! It is pushed out of place by your solid finger, and although when you remove your finger the whole is quickly filled up by the atoms of water sliding back into the place, you must believe that the water has lowered in the glass just the size of your finger.

Now, children, we will try a little experiment. We will fill this glass even full of water, and set it on a dry plate so that we may see every drop that runs over. We will take this lump of fine salt, (it is nearly as large round as your finger, Lucy, and dropped into the water in a lump would cause it to overflow) mash it very fine, and then sprinkle it slowly on top of the water, allowing the bubbles of air to escape. There! we have put it all in and the water won't hold any more, I think. Well, now we will take a teaspoonful of this powdered sugar and sprinkle that in slowly, the same way that we did the salt, and yet now the glass seems no nearer to overflowing than at first.

What do you think of that, children? Have we really got three different things in the very same place at the same time? It does seem so, but the truth is that natural philosophers have found out that the atoms of sugar are smaller than those of salt, while the atoms of salt are smaller than water atoms. So that the atoms of water, being larger than either salt or sugar, rest in the tumbler something as these oranges do in this glass dish. See, we can drop these nuts very easily into the spaces between the oranges, as we drop the atoms of salt which partly fill the spaces between the atoms of water. Now we can nearly fill up the spaces between the nuts and oranges with sand, as the atoms of sugar dropped into the spaces left between the atoms of salt. Only our eyes are not fine enough to see all the atoms in nature.

Even air and gases are impenetrable. They occupy their own appropriate space.

I will take this small vial, which contains only air, and try to pour water from the pitcher into. Why does it not fill up? Because the neck of the vial is too small to allow the inside to escape and at the same time so large a stream of water to enter. In order to fill it, I must insert, very loosely, this little funnel, and pour the water through it, allowing the air in the vial to escape outside the neck of the funnel. You perceive, the air and water must politely give way to each other in going through such a narrow passage.

Here is another experiment to show you how real a thing air is. Let us nearly fill this large glass dish with water. On top o, it we will float this little paper boat. We will now turn this tumbler, containing only air, inside-down directly over the little boat, pressing the glass as far down into the water as we can. Look through the sides of the glass dish. The boat seems to be going down, down under the water, floating now on the very bottom of the dish, and not getting wet, either. You understand that the air cannot get out of the tumbler, and will not allow the water to raise in it, so the little boat is really on top of the water yet, although at the bottom of the dish with water on all side of the tumbler.

Do you remember, children, what property of matter we talked about the last time? Oh, yes; Johnny has brought us a text which he heard read in Sabbath-school, where Solomon, the wise king, teaches the indestructibility of matter. You will find it in Ecclesiastes chapter 1, verses 7 and 9. When you read it, remember that the water in the rivers Solomon wrote about in that day runs in our rivers and oceans to-day, and that there is no new thing yet under the sun. To-day we have been learning something of another property belonging to all matter. It is called *Impenetrability*. One body cannot penetrate another body so that both will occupy the same place at the same time.

The prime business of agriculture is to produce desirable plants in a sufficient abundance, of the best quality and with the greatest economy. To do this with the highest success, and with that rational intelligence which is generally supposed to be a distinguishing characteristic of the lords of creation, demands a knowledge of vegetable anatomy and physiology, far more intimate and thorough than has ever been attained.

Eminence is not to be reached by a frantic struggle. The road to it is much more commonplace. He that would dazzle must first dig.

Women.

A Fashionable Lady's Lament.

BY MRS. M. E. WOODFORD.

(After Hood.)

Work, work, work,
But not in hunger and dirt
For I'm not the woman of song ago,
Who sang the song of the shirt.
But I am young and fair,
And I do not work for pelf,
But I'm wearing myself out inch by inch,
Making clothes for myself.
For it's I and and ruffle and puf,
And tuck, and ruffle, and band,
Till I know I am the veriest slave
There is in all the land.

I've no time to read the news,
No time to improve my mind,
No time for those old household ways
To which our mothers inclined.
Click, click, click.
My machine never ready and true,
Though every day working faithfully,
The end comes never in view.
For it's tuck, and ruffle and puf,
Shirring, knife plaiting and band;
Why should I be the greatest slave
There is in all the land?

Oh why am I a slave
To fashion's foolish whim!
Why labor so hard for outward show,
And neglect the pearl within?
"Consider the lilies" fair,
"They neither toil nor spin:"
Oh, who would not be a lily,
And have no ruffles to hem?
For it's tuck, and ruffle and band,
And band, and ruffle and puf.
Of all this foolish flummery,
Oh, when shall we have enough?

Oh, men with sisters dear,
Men with mothers and wives,
How can you stand by so quietly,
While we're working away our lives?
Ye men with vigorous nerves,
Ye men with brave hearts and brains,
Can you not invent a new machine
To make our dresses by steam?
Then with bands, and ruffles, and puffs,
All finished and without flaws,
Then, having nothing else to do,
We'll help you make the laws.

—[Prairie Farmer.

WHO DARE BE FREE?

BY NELL VAN.

"YOU are going to cut of your hair, Susie, did you say? Well, did I ever hear of such a foolish caper?

"And why not, Kate?" asked the wondering girl. "May not I do as I like with my own?"

"Certainly, child, if your mother does not object, but I should think she would know better than to allow you to do such an outrageous thing just as you have grown into young-lady-hood, and ready to go into society."

"Stop, Kate, I do not wish to go into society, except of my own choosing, and as to growing into young-lady-hood, a few years more or less makes no difference if we retain the follies of childhood. I have good reasons for what I am about to do, and if you or any of my friends love me less for mere external appearance, I do not value such friendship."

"Stay, Sue; don't 'get your back up' so readily. Give me one good, substantial reason for cutting off such a luxuriant growth of beautiful golden hair, with just enough wave in it to render the light and shade so bewitching that it enhances even a moderate share of beauty in your form and features."

"Well done, Kate," said the amused Sue. "I never once thought that you admired my foxy, shaggy mane. I shall soon find out how many silent admirers these same locks have had all these years. Fact is, I'm not going to bury the luxuriant growth, etc., out of your sight forever, as I greatly fear its owner may be laid away some of these days, unless something is done now. No, it shall be placed in a frame in a conspicuous place, suitably labeled, if need be, for people to admire. You ask me for a good reason for the clip, and can I give you a better one than that my health suffers daily by the weight and heat of that same 'luxuriant growth?' When I allow it to flow over my shoulders my head is somewhat relieved, but my neck and the upper part of my spine is then unnecessarily heated. Then the snarls to be combed out two or three times a day demand the patience of a Job. Braiding it nown one's back is so unsuitable in one of my years, and besides the weight remains the same. I go for health and comfort every time, Kate, and if I could lay my head in cold water several times a day there would be less burning pain in it, and I should feel better all over."

"But, Sue," said the persistent Kate, "you are not in such ill health as to warrant such a sacrifice. What if you do suffer a little with your head? Don't we all suffer somewhat for appearances' sake? Do you think I could have so trim a figure without wearing my stays a trifle tighter than is comfortable? My French boots, too, would never fit my feet if those same feet were not forced into them and obliged to endure a little pinching. Come now, be sensible for once, and don't disfigure yourself for life by cutting off what you can never replace."

"I will be sensible for once, Kate, and resist your pleadings, since vanity must be held in the balance with comfort, or rather, duty to myself and friends. Never will I admit that mere personal appearance prevented me from obeying the laws of health. You, Kate, may lace in your form, and pinch your feet, all the while imagining that you are improving upon nature, at the same time claiming to be a sensible young lady; I, with no such claim, simply desire to conform to nature's laws. From principle, I neither wear stays nor tight clothing; while shoes that pinch are my utter aversion. Life is for something better than setting traps. Mattie Wheeler told me the other day she could not spoil her market by cutting off her hair, and she, poor girl, fast going into a decline because of her habits of life! That's what I call unreasonableness. If my hair is the only charm I possess, I'll sell out to the highest bidder and take a lower seat. Yes, my mother approves of the step, for she looks up at the noble tree at our side door and says to us: 'You see, my children, how much improved it is by trimming off the superfluous branches. At first we could not be reconciled to the rough handling it received from the gardener, but now at every cut fresh shoots appear, and the young foliage so far surpasses the old that we should no longer murmur. In like manner the inner life is also impaired by need of outer pruning. The vegetable growth upon the head often debilitates and hinders the vigorous, healthy condition of body so essential to the proper development of brain force.' She tells us to live healthfully and we will be spared the suffering caused by broken laws."

"Well, Susie, I'm half inclined to believe there's some truth in what you say, but really the case is different with me. I'm well and hearty. Nothing makes *me* sick. I can stand any amount of heat or cold, fatigue, late hours, late suppers—nothing, in fact, seems to disagree with me; while you whimsical folks, who study out a system of living, are always half sick, and don't live out half your days. You see, I'm always well, have no cough like Mattie Wheeler, and, besides, being in society, one is obliged to conform somewhat to its demands. My mother would never consent to my cutting off my hair, if I wanted to ever so much. Short-haired women and long-haired men are her utter abomination, and she would think I was growing strong-minded at once."

"There, Kate, is just where we differ. I am not afraid of being strong in either mind or body, and, in fact, slightly prefer to be both, rather than the weak-minded, delicate-bodied, doll-like women I see everywhere, both in and out of society."

* * * * * * *

"Who was that sweet-looking girl we just met, Kate?" asked a young Southerner of his friend, as they were promenading Broad street together, a few weeks after the above conversation. Kate was in a most amiable mood, decked out in the latest spring style.

"Do you mean Susie Stanton, with the short hair and loose sack, who bowed as she passed?"

"Is that Miss Susie Stanton, the pet of our Professor? I've heard more remarks made about her than any other young lady since I came here. The young fellows all seem half cracked about her,and would give more for a smile from her than any amount of attention from other girls. Tell me more about her, do. How becomingly she wears her hair, and how modest and unaffected she appears. How is it we never meet her anywhere in society so that a body might make her acquaintance, I wonder."

"If he will ever give me a chance to reply, I will try to enlighted my enthusiastic friend," said Kate, ironically.

"In the first place, she is not a girl you would fancy upon acquaintance. She is admired by the Professor, I am told, on account of her natural figure, unrestrained by the dress-maker's art. Besides, she is extremely shy and reticent; will not go into society because she calls it a waste of time, imagining her health will suffer by late hours, etc.; wears dresses much too short for the style, and shoes too large and clumsy. She even cut off the most beautiful head of golden hair you ever laid eyes upon, in order to ease her aching brain with cold water whenever she liked."

"Cut off her head, did you say, Miss Kate? or only her hair? I am sure I saw a most comely face, fringed with golden hair, like the halo we see about the heads of the Madonna. A peaceful expression she wore, too, as if happy and contented to take life as it comes without the continual anxiety to outshine the next one which is everywhere so marked a peculiarity of the northern girl."

"Ah, you are only teasing me, Ralph. We Northern girls are no different from any others, but Sue is a little tinctured with strong-mindedness, I do believe, apart from her short hair. But she is a simple little thing, and has never come out in society. The young men don't know how she censures their small vices, or they would not be so 'cracked after her' as you call it. If all girls were to keep aloof from young men whom they know to be addicted to habits not considered elegant to those of their own sex, we should have a pretty state of society, truly. For my own part, I like these easy-going, roguish sort of men better than the pious, Sunday-school sort, who make such minnies of themselves in society, falling head-over-ears in love with a girl before discovering whether they have made even a favorable impression."

"To which class, pray, Miss Kate, would you consign me? Will you never have done railing about men and their peculiarities? A wiser way, it seems to me would be to discontinue their attentions altogether, as your friend Susie

does, and obtain their homage from a distance, thus unwittingly lifting them up to a higher standard of perfection in order to become worthy of her smile."

Alas! How many of us live for the true and noble object of life, to improve humanity by an excellent example. Precept is well, but silent practice is better. The maiden shorn of her sunny locks, not only saved her own health and grew rosier every day, but through her example and influence her delicate friend, Mattie Wheeler, had her own hair cut, and by observing other health rules became stronger and better than she had been for years. Three more of her young friends saw the error of their ways. They overcame their parents' scruples, cut off their tresses, and lightened their skirts of superfluous trimmings. Resolving to live for comfort rather than only for outward appearance, they became strong enough to dare to be free. They dressed as they liked, took exercise when and as they liked, and finally determined to find employment for themselves according to each one's peculiar talents. One became an artist, and put her whole soul into her work; another learned type-setting, and became an expert, regardless of the sneers of unprincipled persons. Each choosing to become independent of others for support, and free to select for a life companion only such an one as seemed truly worthy, mentally, morally and physically.

Who can say such lives are failures? Young women, everywhere, be strong enough to dare to be free! Let no flattery prevent you from studying your own comfort and well-being. Health first, *always*. The healthy body is a fit abiding place for a healthy soul, and should seek in a mate one as pure-lived as itself, that perfection of species may, in coming generations, become possible.

TWO IMPORTANT QUESTIONS WITH BUT ONE ANSWER.

Among all classes of people the demand for knowledge, sound, practical information, is increasingly urgent. None are so rich as to be above the *need* of it, and no one is so poor as to not desire it.

But, want of time prevents the business man from using the library he may possess, and want of means prevents the laboring man from buying the books he and his family might use.

Among the questions bearing upon the social and business interests of all classes, few are more important than those relating to the means of popular education. Two of these questions are, "How shall the over-worked business man secure an acquaintance with the thousands of subjects of general interest which force themselves upon his attention?" and "How shall the poor man supply himself and family with the means of general information?"

Fortunately, these questions have already engaged the earnest thought of able minds, and during the past five years a grand work has been inaugurated and carried forward nearly to completion which is destined to give a practical answer to these questions and prove a mine of intellectual wealth to the people. It is an epitome of universal knowledge, embracing all times, all nations and all matters in science, art and literature of general interest to those who would be well informed. From it the busiest can get accurate information upon topics which, in the ordinary library, are beyond their reach, and, with it in his hand, the poor man has a library of the largest practical value, such as, in other form, he could never own.

The leading educators and scholars of the land have placed this work above every kindred work for the use of professional and business men and as an invaluable source of instruction for the homes of the people, and the following extracts from notices of the work by those who are well known in San Jose, will serve as a sample of the testimony received from critical sources everywhere:

The second volume of Johnson's Universal Cyclopædia has come to hand. It affords me great pleasure to call the attention of my friends to the remarkable value of its scientific articles. The progress of modern science is so rapid, and implements and processes are so multiplied, that the scientific student is often at a loss to obtain accurate information upon such subjects. To such, Johnson is a perfect treasure-trove. Every scientific article is the work of a master in the special field treated of. I have found there very elaborate and beautifully illustrated articles upon many subjects concerning which I had vainly sought in all other accessible works. I should now be very much at a loss if compelled to do the work of my department without the opportunity of reference to Johnson.

H. B. NORTON,
Prof. of Natural Sciences, Normal School.

I have carefully examined the first two volumes of Johnson's Universal Cyclopædia and find the articles ably and concisely written. The information to be derived therefrom is fully up to the present state of scientific knowledge.

The authors have wisely ignored the long-winded and unprofitable theories of the past, and, like sensible and practical men, have confined themselves mainly to facts. Life is too short to be wasted, in this utilitarian age, upon anything else.

I feel satisfied that anyone who purchases the work will never regret the outlay.

JOHN D. SCOTT, M. D.

The superiority of Johnson's over other cyclopedias is such that most of those owning either of the others are purchasing the former. As a matter of safety and economy, we suggest to the people to see and examine Johnson's before ordering, and thus avoid the disappointment and extra expense many have incurred.

I will gladly furnish latest editions of the others for comparison with Johnsons, as I keep them on hand for that purpose.

JAY FRANCIS, Agent.
P. O. Box 48, San Jose, Cal.

Vinsonhaler's
Business College!
SAN JOSE, CAL.

Thorough instruction in all branches pertaining to a business education.

No scholar graduated who falls below 98 per cent. in Studies and Deportment.

School in session during the entire year.

Pupils can enter at *any time*.

Those desiring Board can find a comfortable Home in the Institute.

All Graduates will be awarded a handsome Diploma.

Pupils attending this College can also have access to any of the English branches taught in the SAN JOSE INSTITUTE *free of charge*.

BUSINESS COLLEGE!

A Day and Boarding School for Both Sexes.

THE SECOND SESSION OF THE CURRENT School Year will commence January 3d, 1876.

In acknowledging the kindness of the patrons of this School, the Proprietors desire to assure them that with the increased patronage will be added increased facilities for imparting instruction. They intend that the School shall offer the very best opportunities for acquiring thorough education, both theoretical and practical.

The course of study in the Academic grade is extensive and thorough.

The Business College has no vacuous.

Students from a distance will find pleasant rooms and board at reasonable prices at the boarding-house.

The Faculty accept to its fullest extent the growing demand of the industrial classes for recognition in the public educational system hailing it as the harbinger of a higher and better civilization.

ISAAC KINLEY,
Superintendent of the Institute
JAMES VINSONHALER,
Principal of the Business College.

1776 **CENTENNIAL** 1876

PROCLAMATION.

Chicago & Northwestern Railway.

Is the popular route overland to the East. Passengers for Chicago, Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their trans-continental tickets via the pioneer route,

THE CHICAGO & NORTHWESTERN R.R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fortwayne and Chicago and Pennsylvania Railways.

☞ Through trains daily, with Pulman Palace ☞ Cars through to Philadelphia and New York on each train.

THROUGH TRAIN, WITH PULLMAN PALace Cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (New York Central and Erie Railways):

☞ THROUGH TRAINS DAILY, WITH PALACE ☞ Drawing Room and Silver Palace Sleeping Cars through to New York.

By the Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways:

☞ Through trains, with Pullman Palace Draw- ☞ ing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

By the Baltimore and Ohio Railroad:

☞ Through trains daily, with Pullman Palace ☞ Cars for Wheeling, Zanesville, Newark, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace sleeping cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through cars to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento, and in all the Ticket Offices of the Central Pacific Railroad.

MARVIN HUGHITT, W. H. STENNETT,
Gen. Supt., Chicago. Gen. Pass. Agent.

H. P. STANWOOD, General Agency, 121 Montgomery street, San Francisco.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

ONLY 25 CENTS.

Comfortable Combination Clothing.

THIS STYLE OF UNDERCLOTHING FOR Ladies has been found by all who have used it, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying to **Mrs. Herring,** east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen,) or by addressing

C. C. C. Company,
Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. It is the invention of a California lady who makes every pattern herself and writes full directions upon each. No family that once tries this style of clothing will ever go back to the others.

Corner of First and Santa Clara streets. In McLaughlin & Ryland's building, San Jose, Cal.

☞ For 75 subscriptions to the **California Agriculturist, Live Stock and Household Journal** at $1.50 each, the publishers will give a **$70 New Davis Sewing Machine.** Here is an opportunity for some energetic lady to get the best Sewing Machine for a little time well employed. The **DAVIS** took the first premium at the Santa Clara Valley Agricultural Society's Exhibition last Fall.

IMPROVED FRUIT PACKAGES

The Santa Clara Valley Fruit Package Manufacturing Company are now making berry boxes by the wholesale. With their new machinery for slicing off material, they can make packages that, for lightness, strength and cheapness combined, cannot be excelled in the world. Their light strawberry boxes are thin strips—24 to the inch—and are bent into shape by grooving. The bottoms are raised above the lower sides so as to allow ventilation. The crates, or cases, are made to hold 8, 12, 16 and 24 pounds of fruit in boxes. These are also made of thin, light, strong pieces. The whole compiete—crate with cover and 24 one-pound boxes—only weighs $4\frac{1}{2}$ pounds, and costs but 35 cents. The crate complete, with 16 boxes, weighs but $3\frac{1}{2}$ pounds, and costs only 25 cents. The packages for 100 pounds of fruit weigh but 20 pounds, or less. Contrast the old cumbersome chests, weighing 80 pounds and costing $8 each, with these new, cheap, free packages. There is no trouble of back freight: no heavy extra freight on packages; the person who buys the fruit has no bother, but takes the box home. The most important thing, however, is the perfect condition in which the fruit carries, whether long or short distance. Persons once using these packages will use no other. All sorts of berry and fruit boxes will be made in their season, or to order, in a manner and at prices that will suit all. Also fruit and market baskets of superior quality. Address,

Santa Clara Valley Fruit Package Manufactory, St. John Street, between Market and First Streets, San Jose, California.

The American Bee Journal,

Established in 1861 by the late Samuel Wagner, at Washington, D. C., is now published Monthly at CHICAGO, Ill.

MATLICK'S CELEBRATED FOLDING STACKER!

FOR THE PURPOSE OF

Handling Grain in the Straw,

Stacking Hay or Straw,

Handling Hay Bales or Other Weights.

This Machine has been extensively introduced in the East, and stands pre-eminently the Stacker for the people. **It defies all competition, and has taken the First Premium** wherever entered. Some of the advantages claimed are: It is simple in construction, easily moved from place to place, and conveniently operated, raising the grain, hay or other weights, and at the same time, and by the same operation, swinging it into the position in which it is to be placed; thence returning promptly to the former position.

It is the Only Folding Derrick Used.

It has Two Movements—Vertical and Lateral.

CERTIFICATES.

The following are only a few of the letters of endorsement received from those who used the Stacker on the Pacific Coast last year:

MR. I. N. MATLICK: Dear Sir—Allow us to say that we have used one of your Stackers, and unhesitatingly pronounce it the best machine we have seen for stacking hay or straw, handling haybales, wool bales, etc.

Visalia, Cal., Dec. 1, 1874. W. J. WHITE & Co.

MR. I. N. MATLICK:—We used one of your Stackers last year, and are fully convinced that it is THE STACKER. G. W. SMITH & BRO.

Visalia, April 9, 1876.

MR. I. N. MATLICK, Visalia, Cal.:—Your Stacker is superior to any machine I have seen for stacking, of which I am convinced in putting up 2,000 tons of hay last year. S. JEWETT.

Bakersfield, Kern Co., Cal., March 10, 1876.

MR. I. N. MATLICK, Visalia:—Having tried your Stacker to my satisfaction, I find it just what I want, and far superior to any other machine for the purpose. I have therefore purchased the right to build three upon our own farm. G. F. THORNTON.

Manager for Carr & Haggen.

Bakersfield, April 21, 1876.

MR. I. N. MATLICK, Visalia, Cal.:—I used your Stacker last harvest, and am fully convinced that it has no equal. PHILO D. JEWETT.

Bakersfield, Kern Co., April 22, 1876.

MR. I. N. MATLICK, Visalia:—Having used different stackers, and knowing the value of your machine by its practical work, deem it superior to any other. I have therefore purchased the right to build four Stackers upon my farm.

Bakersfield, April 22, 1876. WM. H. SOUTHER.

THE WORLD IS CHALLENGED FOR AN EQUAL.

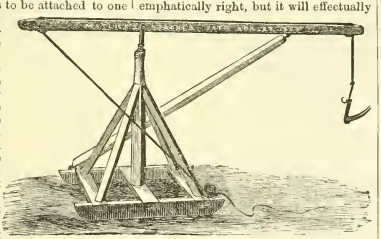
MATLICK'S HAY DERRICK.

A good derrick to use in the hay field, and at the stack; one that is easily moved from place to place; always in readiness for work; that will lift light or heavy weight perpendicularly and swing it at once to its place without trouble, and return to its former position; that can be managed with the least number of hands—such a derrick has long been desired by our farmers, and is shown in our illustration. It is constructed upon an entirely different principle from the old arm-derrick that is held up with guy-ropes. It is the embodiment of an original idea, wonderful at once for its simplicity and adaptability. The upright post upon which the horizontal beam is pivoted, is thoroughly braced to a frame, which, as will be seen in the illustration, is a sled that can be drawn and placed where wanted by the same team that is used to raise the weight. This same frame can be set upon wheels if desired, but for ordinary use it is not necessary. The horizontal beam is supported at two points, first upon the center post, and second upon the long brace that the cut shows to be attached to one corner of the sled frame and reaching up to near the end of the beam. This brace is the real genius of the derrick. The only rope used is the one to which the fork is attached. This runs through blocks over the beam and down through a block attached to the corner farthest from the brace. The horse pulling from this block raises the fork directly from the ground or load, the derrick beam remaining motionless, until at a given hight a stop in the rope causes the motion of the team to swing the beam around with a slight upward motion to where it is desired to drop the weight, after which the beam at once returns to its place without any assistance. This voluntary motion is induced by the gravity of the swinging brace, which presses in that direction from the position of its foot. We have thus particularly explained the working of this derrick because it is constructed upon a new principle, and is deserving of the attention of everyone wanting an apparatus for the purposes for which this is designed.



Mr. Matlick, the inventor, has been introducing his derricks in our county lately, and we hear but one expression, and that a very favorable one.

FINE STOCK AND AGRICULTURAL FAIRS.

It is a cheery sign for the early inauguration of something better than horse-race gambling at our county and state fairs, when our stock men come boldly forward, and propose to take *back seats* no longer. Year after year they have been content to be run over and throwu dust upon by the fast men and horses, who have monopolized agricultural fairs for purposes of gambling and grand carousal. Not exactly content, perhaps, for they have kept up an incessant grumbling, but nevertheless have submitted in a manner that showed a subjection anything but sublime. Our local Santa Clara Valley Agricultural Society has really treated them better than any other, and has, in consequence, been favored by better exhibits of stock. Several stock breeders, for a year or two back, have declined to exhibit at all at the State fair until a different order of things prevails.

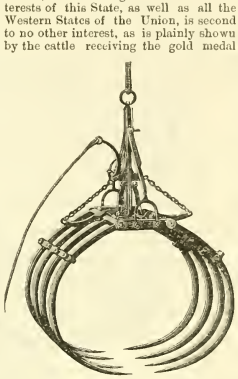
Finally, the matter seems to have come near enough to a tangible focus to show some force. All that is now needed is a very general unity, not only of all stock breeders, but of all legitimate industrial interests, upon the ground that the horse-race gambling and liquor-drinking have got to be separated from the respectable exhibits of worthy productions. This will be radical because emphatically right, but it will effectually cure the now disorganized condition of fairs generally. As there can be no harmony between right and wrong, the question of policy as to which should rule is the all-important one. Will it not be best to make short work of the thing, and end the trouble at once, by ruling out the pool-race and ruling in the worthy and the beneficial productions? If you cannot draw as big a crowd, you can get a better one; and if you don't take in as much money at the gate, you can make the fairs a moral and material success, *pro bono publico*, which is something which has not been accomplished heretofore to any great extent, surely.

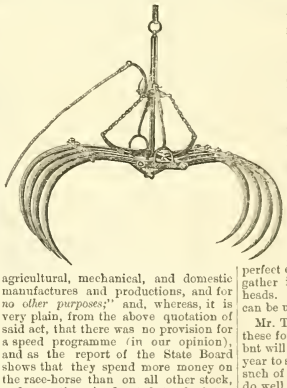
Col. Younger's address before the Cattle-Breeders' Association, shows the true spirit of the stock breeders upon this important question. And as a proof that they are in earnest, we now append a series of resolutions reported by a committee of the Association. Owing to the reluctance of other papers to publish them in full, we are the first to spread them before the public. We only regret that the resolutions are not more radical:

Mr. President, and Gentlemen of the Thoroughbred Cattle-Breeder's Association:

Your Committee, appointed for the purpose of drafting resolutions relative to the exhibition of cattle at the State Fair, would most respectfully report as follows:

That after duly considering the whole matter, and believing that the cattle interests of this State, as well as all the Western States of the Union, is second to no other interest, as is plainly shown by the cattle receiving the gold medal over all other stock for several years past at the annual exhibition of the State Society; and, whereas, under an act to incorporate a State Agricultural Society, etc., the latter part of section 2d of said act reads as follows, viz: "and for an exhibition of the various breeds of horses, cattle, mules and other stock, and of agricultural, mechanical, and domestic manufactures and productions, and for *no other purposes*;" and, whereas, it is very plain, from the above quotation of said act, that there was no provision for a speed programme (in our opinion), and as the report of the State Board shows that they spend more money on the race-horse than on all other stock, and more time is devoted to the interests of the race-track than all other interests combined; therefore, be it





Resolved, That we hereby request the State Board of Agriculture to give more attention to the cattle interests of this State, and do away with the *daily* parade of cattle, as we believe that it is very injurious as well as expensive, and no good derived from it; we also ask that the ten per cent. entrance fee, wherever it applies to cattle in the premium list, be stricken out, as we think and believe it unjust to make an exhibition and pay for it; we further request and ask that our cattle may be exhibited and passed upon in front of the grand stand, the ribbons tied on the successful animals, and the award declared at the time by the Marshal, as is done in other States.

Resolved, That we make the above reasonable requests, and that unless they are complied with, this Association will make no exhibition of cattle at the State Fair.

Resolved, That a copy of these resolutions be sent to the secretary of State Board of Agriculture, to be by him laid before said Board; and that the said secretary is hereby requested to notify the secretary of this Association what action they may take on the above resolutions.

(Signed) ROBT. ASHBURNER, CYRUS JONES, J. D. CARR, } Com.

Sacramento, April 19, 1876.

TABOR DERRICK HAY FORK.

Next in importance to a good derrick is a good hay-fork—one that will gather up, hold onto, and carry into place a large or small grab with equal facility, and that is under perfect control in all positions. Such an one is the Taber, the late invention of Orrin Taber, of San Jose, and manufactured in San Jose.

This is certainly a meritorious invention. Our illustration will give an idea of the way it works, but to be appreciated it must be seen. It grapples onto the hay with a leverage power, increased with the weight of the load. The grapple forks are separately axled into a huge bail, as shown. Each jaw of the fork has two arms at right angles with its axle, one of which the weight of the fork draws upon to open the jaws; the other and opposite lever arm the whole weight draws upon to close the jaws when gathering and lifting. An admirable arrangement for dropping the load completes this almost perfect thing. Besides handling long hay and straw with perfect ease and certainty, it will also gather in its huge grasp chaff or grain heads. With this fork a header wagon can be unloaded speedily.

Mr. Taber has already more orders for these forks than he can fill this season, but will probably be able before another year to supply the demand. Meanwhile, such of our readers as are interested will do well to remember this and examine into its work and merits.

EDITORIAL NOTES.

Messrs. Field, Combs & Kendall, of San Jose, are certainly deserving of special mention for doing fine marble work, as every one who examines will attest. They employ a large force of men, and display work that for elegance and finish cannot be surpassed in this State.

One number of a journal like this can not contain articles upon every subject of general interest. Next month several departments not found in this issue will be given. Now is a very busy season with the most of our readers and correspondents. If you can not write long articles, send us something short and spicy, but don't neglect us.

Another New Fruit-Dryer.—Our fellow townsman, Mr. Wm. Aram, has secured a patent for a new fruit-dryer. His invention consists, first, of a basement where heat is generated in a furnace; second, a large room above divided into apartments by movable partitions; third, the manner of letting the heat into either or all of these at will; fourth, the movable racks for the screens which hold the fruit to be dried, and fifth, the manner of introducing and removing the racks containing the fruit. Mr. A. says that he can build one of a capacity to dry 200 boxes of apples or pears per day for $400. We have examined the drawings, and can see many practical points about the apparatus which we think must bring it into strong competition with the Alden and others. Mr. Bird, of San Jose, will run one this season, and thinks it is just about as near the thing as any yet invented.

Artificial Stone.—The Asbestian Stone Company, of San Jose, is now actively engaged in making many beautiful designs of work. They are laying down pavements for garden walks, making steps, cemetery work, vases, and a variety of solid and ornamental work. This stone is worked in a plastic condition, and it is claimed that it can be cheaply wrought into beautiful forms, and on hardening will endure a long time. J. W. Combs, the noted marble cutter, is president, and Alex. Murgotten secretary, and Wm. Elm Superintendent.

A Matter of Policy.—CAL. AGRICULTURIST PUB. CO.: "Six Months Among the Bees," in May number, is a libel on the country, undoubtedly, and was written, I presume, by some one when he had the blues. It is a bad policy to republish anything of the kind with regard to any portion of the State. Suppose all the papers in the different localities should republish the growling articles with regard to all other localities.—you see it would tend to prevent immigration from the East, and lengthen the time of our enforced employment of the heathen.

Yours, truly,
O. L. ABBOTT.
Santa Barbara, May 17th, 1867.

To publish either the glowing or the "blue" side only, would be unfair. Within the past two years, we have given a great deal of matter flattering to the bee interests in San Diego. We desire our readers to see every side of the question, that they may be better able to form an impartial opinion. On general principles, our newspapers, by publishing only the glowing side of the country, flattering to each locality, deceive the people East, and they come here to be disappointed, and curse the country and people they find so very different from what they were misled to believe. Much might, with justice, be said upon this question. We have often felt like denouncing the over-drawn and one-sided representations sent abroad. We want immigration, but not such as is induced by false advice. To do as we would be done by in this as other things, must be about right.

A look about our immediate locality and surroundings shows a season of business that promises liberal returns.

Enright is running a large force on his 20 new thresher engines and repairing of several others. His place looks like a large locomotive depot at first glance.

McKenzie's foundry has just turned out the largest iron quicksilver furnace ever made for the New Almaden mines, and will soon commence another one.

At the Alameda Foundry, Watkins & Co. are turning out several new engines, a new thresher, and doing a variety of other work.

In this connection we will mention the new patent mammoth horse-rake manufactured by Mr. Balbach, at his shop on Fountain and Second streets. It is constructed something on the principle of the spring wire-tooth rake, but the teeth of this are very heavy and strong, and two horses and two men are required to handle it. It is mounted on wheels and worked with levers, the men riding. Several have already been made, all to order, and give splendid satisfaction. It is no toy arrangement, but is made to do work "and no foolishness."

Our wagon shops are running full hands. Probably the best wagons, as well as the handsomest made on this Coast, are now turned out in San Jose.

All classes of industrial business seem to be rushing at present, in harmony with the prospects of big crops and productive success generally. New houses are going up all over town. New orchards have been planted, and our nurserymen are all enlarging their grounds and business.

Another new canning factory has been erected, and the old firm of Dawson & Co. have greatly enlarged their factory and capacity for putting up fruit and vegetables. Their reputation is deserved, for they put up the best fruit in the best manner, and no trickery or deceit.

Farmers are cutting one of the best crops of hay ever gathered.

The late frosts have damaged early-planted tomatoes and squashes, but the damage is not irreparable, as it is not too late to replant. Mr. Chas. Caruc's twenty acres of early tomatoes are not injured, but are branching out beautifully. He expects to get 25 tons to the acre.

Fruit prospects are good, although strawberries are a partial failure in some spots, from the effect of worms at the roots of the plants. Twenty bushels or so of salt to the acre, at one dose, would probably straighten them out and convert them into fertilizers.

The Mount Hamilton observatory road will be finished within a month. New enterprises are seen on every hand. If energy will insure success in town and country, surely our people should prosper. Our exchanges over the State all speak of full crops and fine business prospects generally. If we deserve the blessings we receive, our happiness may be real.

Medical Inquisition.—The doctors who live upon the medicines others eat are successful—if not in saving lives, at least in making a law that gives them a monopoly. They were not satisfied with keeping their patients in the dark with Latin prescriptions that put 25 per cent. of all drug money paid to druggists into their own pockets, besides exorbitant fees for services pretended; not satisfied with a fair showing of their "science" against so-called "quackery" and common sense, but they must be "protected," that is, must condemn as criminals, whoever differs from their schools of practice. Whoever practices now must hold diplomas from their school of colleges—must pass examinations at their board of inquisition. What does this mean? That the women practitioners who have been debarred from the benefits of a class of medical schools and have been graduated from others, must not attend to their own sex in times of need. These monopoly-diplomad men doctors must have all such delicate cases. There is profit and prestige in it that they cannot afford to lose. It means that liberal ideas upon health subjects must be crushed out and made dishonorable. The medical priest-craft must be honored and patronized. It means that this same class of privileged dictators want a clear field, so that they can, with even greater impunity, destroy the sensitiveness and modesty of daughters, the purity of wives, and the honor of husbands and fathers. They have in this act thrown down the gauntlet which they will find some not too cowardly to pick up. We expect, law or no law, to employ whoever we please, if we need medical aid in our family, but it will never be one who is inside of this iniquitous inquisition ring

The Mechanics' Institute will hold the eleventh Industrial Exhibition in San Francisco this season. Application for space is now in order. Goods will be received July 25th. Exhibition opens August 8th. This fair will be called the California Centennial Exhibition, and every arrangement is making for a grand fair.

City Gardening.

HINTS FOR THE MONTH.

OUR illustration for this department this month is a beautiful aquarium and fountain suitable for in-doors, a hall or conservatory, or for a small yard, or a retreat in a large one. Our city florist, Mr. Mitchell, can fill orders for such.

The care of an aquarium properly comes under the head of City Gardening as the plants it contains should not be the least attractive portion, and are quite essential to the health of the fishes, by absorbing the effete matter and supplying fresh oxygen to the water. Many beautiful plants will grow quite as well rooted in the sand at the bottom and rising above the water. Besides, "there is scarcely a weed to be found in any brook but may be safely transplanted to it—a little washing and trimming being necessary to remove decaying matter." Want of space this month, only, prevents us from giving quite full directions how to proceed. A well-stocked aquarium is certainly a most beautiful and companionable object.

In her "Familiar Talks," this month, our practical correspondent, "Snip," wants to know how to have good success in growing moss and ferns in open air. The conditions most favorable will comprise these essentials: A composted soil rich with vegetable mould; shade from the direct sun during the greater part of the day; a quiet atmosphere—wind is injurious to them; plenty of moisture—in fact, they should be completely saturated once a day, either by plunging into water or by other means; the evener the temperature the better. In-doors, near a closed window, where the morning sun strikes them an hour or two, is the most favorable place. Our moss kept fresh as long as the bath was attended to regularly, nearly two years, and the ferns did not grow stunted until the third year—and then we think only through neglect, while our family was away. A little ammonia occasionally with the water, or the leeching of stable manure, should be given to keep up the fertility of the soil—or a portion of the soil may be removed from the stand or basket and fresh compost put in its place.

A large warden case, where the moss and ferns grow secluded from the change of air, and are uniformly moist under the glass, of course, is still a better place for this class of plants. But the rules given above will prove quite successful with our ordinary hardy mosses and ferns, and nearly as satisfactory.

As to the white mold upon rose buds and bushes, it is a cryptogamic growth, a sort of plant-infusoria that is very bad in moist situations. We notice that roses growing in the full sunlight during the entire day are less troubled than the same varieties which grow where partially shaded. We know of no absolute remedy against this white mould. Jackson Lewis, of San Jose, who has the finest collection of flowers in the State, has paid a good deal of attention to this blight, and tried numerous experiments, but finds that dusting often with the flour of sulphur is as good as anything he can do. The Giant of Battles seems to be worse infested than any other variety.

The green aphis is a very annoying pest in a flower garden. A thorough dusting of the trees or plants infested with dry slacked lime, as often as the aphides make their appearance, seems to

be about as effective as anything, where one has not the time to make clean work with snuff or tobacco smoke or sulphur fumes. The same treatment for slugs is also good; but, of course, a thorough hunt evening and morning, with a dish to put them in for final scalding, is still better.

The woolly aphis, which infests apple trees and some others, can be best exterminated by a strong soap-suds of whale-oil soap, or of strong common suds with some kerosene or carbolic acid mixed in. Tie a swap on a pole or broom-handle, and make clean work if you can. The roots of infested trees can be helped by the application of a bushel of gas-house lime spaded all about the roots.

The scale bark-louse is terrible on orange trees, the oleander and several other trees and plants. The same wash, with the addition of a little blue stone, will, after a few applications, get the best of them. If one has but a few trees it will pay to handle them for such insects and grubs as are enemies to the garden.

Poetry.

John Reed's Musings.

BY BAYARD TAYLOR.

SEE, as I lean on the fence, how wearily
trudges Dan,
With the feel of spring in his bones, like a
weak and elderly man;
I've had it many a time, but we must work
when we can.

But day after day to toil, and ever from sun to
sun,
Though up to the season's front and nothing be
left undone,
Is ending at twelve like a clock, and beginning
again at one.

The frogs make a sorrowful noise, and yet it's
the time they mate;
There's something comes with the spring, a
lightness or else a weight;
There's something comes with the spring, and it
seems to me it's fate.

It's the hankering after a life you have never
learned to know;
It's the discontent with a life that is always thus
and so;
It's the wondering what we are, and where we
are going to go.

My life is lucky enough, I fancy, to most men's
eyes,
For the more a family grows, the oftener some
one dies,
And it's now run on so long, it couldn't be other-
wise.

And sister Jane and myself, we have learned to
claim and yield;
She rules in the house at will, and I in the barn
and field,
So, nigh upon thirty years!—as if written and
signed and sealed,

I couldn't change if I would; I've lost the how
and the when;
One day my time will be up, and Jane be the
mistress then,
For single women are tough and live down the
single men.

She kept me so to herself, she was always the
stronger hand,
And my lot showed well enough, when I looked
around in the land;
But I'm tired and sore at heart, and I don't quite
understand.

I wonder how it had been if I'd taken what
others need,
The plague, they say, of a wife, the care of a
younger brood?
If Edith Pleasanton new were with me as Edith
Reed?

Suppose that a son well grown were there in the
place of Dan,
And I felt myself in him, as I was when my
work began!
I should feel no older, sure, and certainly more
a man.

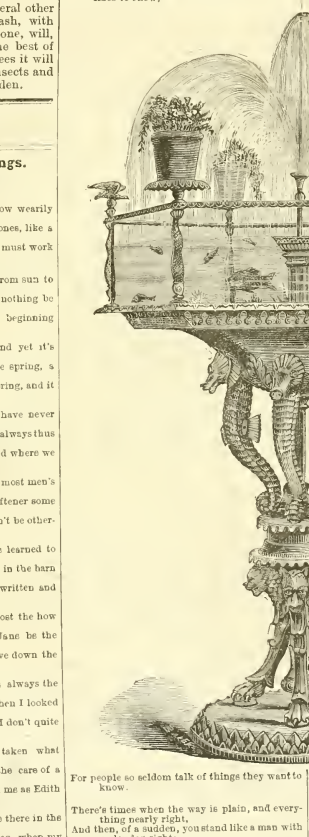
A daughter, besides, in the house; nay, let there
be two or three!
We never can overdo the luck that can never
be,—
And what has come to the most might also have
come to me.

I've thought when a neighbor's wife or child was
carried away,
That to have no loss was gain; but now, I can
hardly say:
He seems to possess them still, under the ridges
of clay.

And share and share in a life is, somehow, a
different thing
From a property held by deed, and the riches
that oft take wing;
I feel so close in the breast!—I think it must be
the spring.

I'm drying up like a brook when the woods have
been cleared around;
You're sure it must always run, you are used to
the sight and sound,
But it shrinks till there's only left a stony rut in
the ground.

There's nothing to do but take the days as they
come and go,
And not to worry with thoughts that nobody
likes to show,



For people so seldom talk of things they want to
know.

There's times when the way is plain, and every-
thing nearly right,
And then, of a sudden, you stand like a man with
a clouded sight;
A bush seems often a beast, in the dusk of the
falling night.

I must move; my joints are stiff; the weather is
breeding rain;
And Dan is hurrying on with his plow-team up
the lane.
I'll go to the village store; I'd rather not talk to
Jane.

Harvest Song.

O thanks for the bountiful harvest,
And thanks far the joy that it brings;
The harvest of hay from the meadows,
Where the bobolink cheerily sings.

O thanks for the corn, bright and golden,
And thanks for the wheat and the grain,
For the bountiful, bountiful harvests,
That add to the harvester's gain.

We rejoice in the fruits of the season,
For the apple, the peach and the pear;
And the hosts of wild plums and berries
That grow without culture or care.

We've a love for the ripe, rich pumpkin;
And 'tis a love that seldom dies;
But the love is many times stronger
For our mother's good pumpkin pies.

We delight in large fields of cabbage,
(We've an Irishman's "tooth" just now)
And what we don't want for the table
Will be food for the nag and the cow.

We've a relish for the sweet potato,
As well as for the Irish kind;
And to eating of the "Grant" tomato
Our habits and tastes are inclined.

'Tis a fact—and none will deny it—
That much of our living is bread;
Were it not for the habit of eating,
The life that now is would be dead.

O thanks for the bountiful harvest!
And thanks for the joy that it brings!
We rejoice in the gifts of Natnre,
Whence much of our happiness springs.

Go Work Upon a Farm.

Will S. Hays, the eminent Southern song writer and composer, has published a song entitled "Go and Learn a Trade." Just at this time, with factories and shops closing up, and mechanics begging for bread in some sections of the country, it seems to me that such a song is quite out of place. In view of this fact, I beg to offer your readers the following agricultural song:

The song I sing to you to-day
Is not to learn a trade;
For I am sad the truth to say—
That song aside is laid.
The mills are running on half-time,
The shops give forth no noise,
And it is hard to find a dime
Among the 'prentice boys.

Chorus—
The song that I shall sing to you
Your troubled hearts will calm;
If you have nothing else to do,
"Go work upon a farm."

The stores are filled with idle clerks,
Because the times are dull;
And he his duty plainly shirks—
When shops and mills are full—
Who seeks to learn a trade, or tend
The counter of a store,
In hopes the future yet will send
A fortune to his door.

Chorus—
Ah, vain are all such hopes as these,
That surely end in harm!
Don't seek to sit 'neath shady trees—
"Go work upon a farm."

Oh! why should men in cities pine,
Or idly stay in town?
Why loaf around, and crossly whine
That "things are upside down!"
Can this bring bread to wife and child,
And make the future bright?
Can this turn the weather mild,
Or furnish heat and light?

Chorus—
Such men should listen to my song,
And in it find a charm;
It tells them how to get along—
"Go work upon a farm."

Let no man starve for want of bread—
The product of the soil—
For all can still be amply fed,
Who will but share the toil—
The honest, manly toil that brings
The harvest season round,
When the glad farmer gayly sings,
Because of fruitful ground.

Chorus—
This, then, shall be the song we sing,
The whole world to alarm,
And loudly let the chorus ring—
"Go work upon a farm."
—(Sidney Herbert, in Semi-Tropical.

A Farmer's Song.

We envy not the princely man,
In city or in town,
Who wonders whether pumpkin vines
Run up the hill or down;
We care not for his marble halls,
Nor yet his heaps of gold—
We would not own his sordid heart
For all his wealth thrice told.

We are the favored ones of earth,
We breathe pure air each morn;
We sow; we reap the golden grain;
We gather in the corn;
We toil; we live on what we earn,
And more than this we do—
We hear of starving millions round,
And gladly feed them too.

The lawyer lives on princely fees,
Yet drags a weary life;
He never knows a peaceful hour—
His atmosphere is strife.
The merchant thumbs his yard-stick o'er,
Grows ragged at his toil;
He's not the man God meant him for—
Why don't you till the soil?

The doctor plods through storm and cold,
Plods at his patient's will;
When dead and gone he plods again
To get his lengthy bill.
The farmer (bless his noble soul!)
He grasps the mighty earth,
And stamps it on our daily sheet,
To cheer the farmer's hearth.

We sing the honor of the plow,
And honor to the press—
Two noble instruments of toil,
With each a power to bless.
The bone, the nerve, of this fast age,
True wealth of human kind—
One tills the ever generous earth,
The other tills the mind.
—(Boston Investigator.

Treat laboring man and beast well.

Sheep and Goats.

SHEEP AND GOAT BUSINESS RELATIVELY CONSIDERED.

It may not seem exactly fair to draw a contrast that is so one-sided as is this at the present time. But in consideration of the fact that within three years some of the principal papers of the State decried the raising of Angora goats as something impractical, and also how the sheep breeders would generally sneer at the business, we feel that the goat men have a right to crow, just a little, if they feel like it.

There is now a general depression in the wool market all over the civilized world that is most discouraging, and that has a tendency to make the business of sheep breeding on a large scale rather precarious. The price of sheep is correspondingly low, and the business does not pay at all at present—in fact, many herds are sinking money.

Returns from the manufactories East of prices; and for mohair of this year's clip, will equal that paid last year. Mr. Bailey has returns from the first lot of 800 pounds, sent early, which prove this. Probably next month we will be able to present full returns. The prices of, and demand for goats have never been more encouraging to breeders. The Robe and Glove Company, in San Jose, have pressing orders that they can hardly fill—several from the Eastern States. An advancing civilization must increase the demand for such goods as are produced from the skins and fleece faster than the supply can possibly increase for many years, even upon this coast, where they can beat the world.

We have always favored this industry; indeed, the Angora goat has been the special pet of the CALIFORNIA AGRICULTURIST, and we are more than ever enthusiastic upon the subject, not from any pecuniary point, for we do not own nor have we an interest in a single goat, but on general principles.

We would not condemn the sheep business by any means, and we advocate the *best breeds*, and the keeping of them where they can get *plenty to eat during the entire season*. The old way of keeping 10,000 sheep upon as many acres of uncultivated lands, allowing them to fatten half the year and starve the other half, we never could see anything in to recommend.

A civilized sheep farm should consist of not only a hill or upland range, but of cultivated fields where alfalfa, and grain, and hay can be produced to supply good and equal feeding during the entire year. One hundred acres rightly managed will keep as many sheep as one thousand on the old plan, and produce twice as much wool to the animal, worth twice as much per pound as the ordinary clip. The sooner the wild, uncivilized, slip-shod sheep-raising is exploded the better for the country.

If sheep are well fed during the entire year, one long clip will pay better than the two-clip system now in vogue. The reason why sheep are sheared twice each year is not that an extra growth in this climate justifies it, but because the starving process during a portion of the year causes a week place in the fibre which breaks in manufacturing. Proper feeding would remedy this. These remarks will as well apply to goats as sheep. The goat men find it to their advantage to feed equally during the year, as Stockton and Buffum's experience last year proves.

The lessons of stock raising generally, as taught from experience in this State, are in favor of *best breeds and cultivated farms*. Under proper cultivation, land will support from four to ten head more of stock to the acre, besides supporting and enriching a large population of enterprising inhabitants. Of course, there are some lands fit only for pasture. But these should be used in connection with better lands a portion of the season.. While the animals are feeding upon the light pastures, the cultivated lands are producing hay and grain for winter, and will also make late pastures on the stubble. It is time for sheep men and cattle men to awaken to the fact that there is more money in a flock or herd of good stock, kept in a civilized way, than in the common "plug" stock running half wild upon wild lands in a manner that none but savages should ever think of imitating. We have little patience with, and precious little sympathy for the class of stock men who pursue a system so antagonistic to civilization and adverse to their own best interests.

THE ANGORA GOAT.—Colonel R. W. Scott, who is counted authority upon the subject of Angora goats, has lately written an interesting article touching upon the history and value of the Angora goat in this country to a Southern paper, the Sanford *Journal*. We take pleasure in transferring the same to our columns:

Dr. J. B. Davis, of South Carolina, was sent to Turkey as a Commissioner of the Uniten States, upon the application of the Sultan of Turkey, for the purpose of teaching his subjects cotton-raising, in the year 1846. After a residence of some three years, finding the climate unsuited for cotton raising, he returned home, bringing with him the Angora goat from Asia Minor. In 1849, he landed in Charleston with seved ewes and two bucks of the pure Angora, which he at the time, under a misapprehension, probably, called the Cashmere goat. These were, unquestionably, the first goats brought into this country. The Earl of Derby obtained a pair from him, who stated that they were the first of them seen in England. A small flock had, prior to this time, been imported into France, and located on the Pyrenees.

Ever since the first introduction of these goats into the United States, there has existed in the popular mind much error in regard to their species—errors due, principally, to the action of importers and breeders themselves, mis-naming this animl is, either through ignorance or interest. Dr. Davis is responsible for the name of "Cashmere" being applied to these goats. The Thibetian or Cashmere goat comes from the famed Vale of Cashmere, in India, which is a great distance—some three or four thousand miles—from Angora, in Asia Minor. It is an entirely distinct animal from the Angora goat, though some European naturalists have claimed that the two races have affinities in common. This goat bears wool only "by ounces," while the Angora produces mohair "by the pound"—the best ewes yielding from three to seven pounds each, and best bucks from seven to ten pounds each.

In the year 1852, Mr. Peters purchased of Dr. Davis his entire flock of pure breeds, consisting of eight ewes and three bucks, for which he paid the sum of sixty thousand dollars, (a sum which, by some, may be considered a very enormous price). He has kept a perfect record of these goats since they came into his possession and obtained their prior record from Dr. Davis, so that he can, at any moment, tell where the stock is at this day. But few of the imported goats have proven to be of much value to breeders who understand their business. Very few are superior to a third or fourth cross of a pure Angora on a common goat. In a letter written by Mr. Peters, he says:

"In 1856, I found that the fourth cross, passed on the native short-haired ewes, with selected purebred bucks, when bred by careful selections, produced an animal superior in every respect to the imported, for breeding purposes excepted. I owned a flock of 500 grade ewes in 1859, bred with great care, each animal marked to designate its grade. These I distributed, by sales of flocks from ten to twenty ewes with a pure-bred buck at the head, to all parts of the West and Southwest during the years 1860 and 1861, and made a very handsome profit. The forehead has soft hairs of less length, less applied to the skin, in parts, curled. The hair of the beard, which is pointed and moderate dimensions, being six inches in length. (German measurement) is stiffer than the hair of the rest of the body, but less so than the beard of ordinary goats. I ascertained, however, that when resold, in every instance, the word *grade* was expunged, and they sold as 'Peters' *Cashmere* goats of the Davis importation.'

"I sent a small flock of grades to Pennsylvania, in the year 1859, and by 1866 they were advertised and sold as if of pure breed.

"In the year 1866, I sent a flock of over 100 head to Ohio, all grades, but a half dozen bucks. They were sold, by me as grades, and the next year sent West as *Cashmere*."

These statements show the / "dark ways" formerly resorted to by unscrupulous dealers, in the sale of goats—practices which have injured this new branch of wool production in America beyond computation. Mr. Peters continues:

"The owners of goats in Asia allow them to run at large in very extensive flocks, and make no selection in breeding; and, although fine animals might be had high up in the hills, by a person who could go there and remain a year, or all, or nearly all, sent to this country come from localities easy of access, and not one male in a hundred is fit to breed from to improve a flock.

"The Vicuna and Llama cannot be bred to any advantage, and cannot be acclimated to live on an elevation of less than 5,000 feet above the sea. The Angora ought to be 3,000 feet, but will thrive near the sea level, if allowed a wide range in woods or old fields. They are not a grass-eating animal, and when kept on such, in small inclosure, soon become unhealthy. They are a browsing animal and cannot stand being high fed with grain and grass."

The description of the physical characteeistics of the two races, when compared, show how different they are.

The description of the Angora, given by M. Brandt, an European naturalist of high repute, and director of the Museum at St. Petersburg, in 1855, is minutely as follows:

"The magnificent example of the Angora goat, which the Museum of the Imperial Academy owes to M. Tchihatchess, (the learned Russian traveler) produces, at first sight, the general impression of a domestic goat, when attention is directed to its thick and silky fleece, to its ears turned downward, and its inconsiderable size. But it is precisely these traits which impress upon this animal a distinct seal, which gives it the character of a peculiar race whose origin is not the same as that of the domestic goat. The extremity of the snout, the cheeks, the nasal and frontal bone, as well as the ears and lower part of the legs below the tarsal articulation, are covered with *greyish white tint*, are longer than the head; at the lower part, the interior marginal bone turns inward in such a manner, that, in this part, they appear broad seen from the front, and narrow when seen from the side; at half their extension, they direct themselves moderately backward, and *turn spirally outward*, so that their extremities, directed upward, are very much separated one from the other, and circumscribe a space gradually contracting itself. The whole of the neck as well as the trunk, covered with long hairs, which, particularly on the neck and lateral parts of the body, are twisted in *spiral curls*, having the appearance of loosened ringlets, it being observed, at the same time, that they reunite themselves into rolled tufts, a disposition which is less marked in the anterial portion of the neck. The hairs that exhibit the greatest length are situated above the foreleg, and are nine and one half inches long. Those of the neck are a little shorter, and are nine inches long, and those of the belly, eight and a quarter inches. The length of the hair with which the lateral parts of the body, as well as the back, as covered, is only seven and one-half inches, and that of the hind legs six to seven inches long. Finally, the slight, stiff hair of the tail is about four inches long.

"The color of the robe of the animal is a pure white, here and there slightly inclined to yellow. The hoofs, somewhat small in proportion, are, like the horns, of a greyish white tint. The hair is, without exception, long, soft and fine; it is at once silky and greasy to the touch, and shows distinctly the brilliancy of silk."

Prof. Lowe, of England, in his work on sheep and goats, describes this goat, which is known as the primitive goat of Angora district in the central portion of Asia Minor, as having "no undercouting at all, but long, white, silky fleece." In Asia there are nearly twenty varieties of fleece-bearing goats, of which the Angora is the most profitable. It is described as having "long, pendant ears, short legs, and heavy body. The fleece hangs in long, spiral, silky curls. The horns are heavy and spiral." Mr. Lendrum in his exceedingly practical and valuable treatise on the Angora goat, says there are, in California, "goats answering exactly that description." He owns pure breeds whose fleeces have been repeatedly searched without success, by different persons, to find kemp, or rough, coarse hair, which is so injurious to wool, because of its inferiority and harshness, preventing it from taking the dyes readily.

Now compare the above description with that of the Thibet, or Cashmere goat proper, and the difference between the two breeds will strikingly appear.

Mr. John L. Hayes, secretary of the National Association of Wool Manufacturers, read a valuable treatise on the Angora goat before the Boston Society of National History, in 1867, exhibiting much intelligent research. In this treatise, Mr. Hayes, quoting Mr. Sanc, the distinguished European naturalist, says the Cashmere, or Thibetian goat, "abounds in Central Asia, many thousands and miles from Angora, in Asia Minor, but whose origin is still obscure. The size of the Cashmere goat is quite large; the horns are *flattened, straight and black*, and slightly divergent at the extremities. The ears are large, flat and pendant. The primary hair, which is long, silky and lustrous, is divided on the back, and falls upon the flanks in wavy masses.

A PROSPECTUS OF PRINCIPLES.

To such of our readers as are already well acquainted with the stand we have taken, and the principles we have supported in conducting this journal, we need say nothing. But to our many new readers, and others who enquire about the character of the Agriculturist, we feel warranted in offering an inkling of some of the ideas we have always advocated, now believe, and propose to adhere to until we are properly convinced to the contrary.

To begin with, the Agriculturist is not a *policy* paper. Its motives are grounded in principle. If a thing is thought to be right, it hesitates not to support it; if wrong, that is sufficient reason why it should be opposed. It depends, for its patronage, upon being true to the best interests of humanity, irrespective of personal considerations. If it cannot stand upon such ground it will fall upon it. While it aims to be charitable to all, and will allow the fullest expression to opinions adverse to what it maintains, it is a journal of decided opinions. No blowing hot to-day and cold to-morrow—changing like a weather cock to suit the wind of vacilating public opinion or party interest. Nor is it a "milk-and-water" concern that reserves expression, fearful of offending those high in authority or influential in some circle. It aims, like the needle of a compass, to be true to common interests.

It is not political in any partizan sense—takes sides with no party—advocates the claims of no candidate for office—but, on general principles, supports reform measures of every kind that appear to be demanded for the general good. It deprecates official corruption, and, to secure honest and efficient legislation and reduce taxation, would reduce salaries of public servants to the standard of wages earned by the hard-working, honest and intelligent producer. It would see a broad patriotism displace the narrow extravagance shown in public affairs.

It would see a financial system founded in the honor and industrial responsibility of the people, and gauged to the necessities of business intercourse. The Government should not pay interest on money issued to banks, nor allow its issues fluctuated in value; and the speculator who would discount its value should be held guilty of treason and punished accordingly.

Monopoly of every description it opposes as wrong and pernicious. Our public lands should be held sacred to the actual settler. No individual nor corporation should be allowed to claim but a limited number of acres under any pretense. He who would hold more land than he can use, to the exclusion of another, should be held an enemy to his country.

Railroad corporations, now so powerful to extort unjust and unequal rates of fare and freight, and to control public affairs, should be shorn of such power. All lines of public travel, telegraphs and postal routes should become common property, and be strictly under Government control.

Co-operation is advocated for every department of business as a fundamental principle of advancing civilization, as a protective measure for the working and producing people, and as a measure calculated to properly secure the comforts of life to every deserving creature and equalize wealth to the advantage of all and injury to none.

Education it would see made public for all, and no child upon our soil should be allowed to be deprived of its advantages. It advocates higher principles of education. Our common schools and colleges should include in their tuition instruction in the use of such tools, principles and trades as are applicable to the wants of everyday life, and, by combining practical work with theoretical propositions and positive science, turn out men and women competent to grapple with life's realities.

With so-called "social" and religious questions, this journal is conservative. Discussions inimical to virtue, constancy and established marriage will not be admitted. It can never be the vehicle of immorality or vileness. While tolerant, it will not be the tool of any sect or creed, either of free-thought or religious denomination. It occupies a broader field of usefulness, interfering with no one's religious opinions, but holding fast to morality in the interest of all good people alike.

Woman is held to be of equal importance with man, and naturally entitled to all the rights, immunities and privileges of man, politically, religiously and socially, as a human being of equal endowments and rrsponsibilities. There is a Woman's Department open for such questions as properly come under it.

Temperance is advocated as of great moral and material importance. It is a fundamental virtue without which there can be no advancement in other directions. Intemperance is a blight that destroys the germ of development, and soon sinks man into hopeless degradation. The Agriculturist has never advocated the making of wine, brandy or other liquors as legitimate agricultural industries. It has constantly advocated the making of the best use of the grape, which is a noble fruit, highly nutritious and capable of being utilized as food in many ways and of becoming a blessing instead of a curse to mankind. It has often been shown, and can be proven to any reasonable man, that, aside from the moral part of the question, it is much more profitable, in California, to grow grapes for table, raisins, canning and shipping than for wine. We have made many enemies by the course we have taken, and lost much patronage also, but we must insist that we are right until we are otherwise convinced.

Its columns are open to discussions of all important subjects within the scope of its field, and all persons of opposite opinions, as well as others interested in any topic, are invited to communicate their ideas for the public benefit.

Horse-race gambling is another evil barnacled upon agriculture for respectable support that this journal has always vigorously combatted. This course has also brought it much abuse, and weakened its patronage; but it will never cease its work while gambling is a controling interest at agricultural fairs.

Advocating the best use of the soil and of all products of the labor of man, no article commending tobacco-growing nor hop-growing has ever appeared in its columns. It is not conceded to be in accordance with duty to advocate any thing destructive of health, or calculated to injure individuals, or the public weal.

The Agriculturist claims to be clear of any and all pecuniary considerations for any opinion appearing in its reading columns, editorial, selected or communicated from any person or party. Not one cent, directly or indirectly, has ever been received for "puffing," or for publishing any article as reading matter. Its voice is used purely in the best interests of its readers. While under its present management, the Agriculturist can never be bought to advocate anything, good, bad or indifferent. It shall never fall to that detestable position, so common with many papers to-day, of advocating a thing for pay, of claiming to be working for the good of the people while it is the hirling of some designing man, clique or party. It detests such perfidy, and as loudly condemns it as it does any other species of venal corruption.

The Agriculturist is not the *organ* of any order, clique or party whatever. While it is in full sympathy with Grange principles and good work for human advancement, it chooses to remain a free agent, advocating the good for the sake of the right, in the broad interests of all.

It admits none but respectable advertising to its columns. It allows business men to put their business before the people in a business manner, as a business proposition. No clap-trap, eye-catching, imposition advervising solicited or allowed, if we can help it. Any business that is not able to stand on its own merits, in a fair, decent advertisement, we would sooner not see represented in our columns.

Our departments for reading matter are numerous, and largely filled with original articles from subscribers, practicsl, common-sense articles for every day reading, applicable to every department of the farm and home. Among these we mention the Stock Breeder's department. There is enough solid reading, of practical use, in this department ment alone, during the year, to give the paper a great value. The Dairy, Sheep and Goats, Porcine, The Horse, Pisciculture, Apiary, Poultry Yard, The Orchard, The Vineyard, Vegetable Garden, The Grain-Grower, and out-of-doors farming generally, are always treated upon from a practical standpoint. All articles are prepared or selected with special reference to their applicability to the Pacific Coast. The subjects of Irrigation, Alkaline Soils, Land Monopoly, Timber-growing, Capital and Labor, the proper cultivation of the soil for our climate, and, in fact, all topics of interest and information, such as are needed by the practical farmer, are given in successive issues.

The Editor was educated to hard work on the farm, and in the nursery, orchard and garden, and has been twenty years upon the Pacific Coast.

The best part of the farm—the Household—is not neglected. In fact, this journal is so largely household in its get-up as to be a special favorite with farmers' wives, and with all families where it is known. Among the writers for these departments are many of the best upon the Pacific Coast, We might say a good deal in praise of its contributors without undue flattery. Every lady should specially examine the columns of the Agriculturist.

The departments Household, Domestic, Hygienic, Educational, Boys and Girls, City Gardening, and Woman, are almost entirely filled with original articles each month, and of a most interesting character. The beautiful and useful are together combined in its contents and make-up. Man's nature not only demands to be supplied with material comforts, but the things that feed intellectual and moral life and induce to progress of soul. The esthetic nature needs its food of subtler things, and grows upon beauty in everything. Such tastes as are allied to the finer sensibilities and really give us the purest joys of life are by no means overlooked in the spirit and design of the Agriculturist. Its beautiful frontispiece, on cover, designed, fashioned and engraved by woman's head, heart and hand, is in strict harmony with its purposes—even as much so as the sterner subjects that relate to the practical parts of life.

Every general reader of this journal will bear the publishers out in the above statements. It is from such as have not become acquainted with the California Agriculturist and Live Stock Journal, a Household Magazine and Rural Monthly for In-doors and Out, that the publishers respectfully ask an examination of its merits. And if the price and character of the paper suits, your subscription is solicited, and your influence in further extending it will be gratefully acknowledged.

BRUTE ANIMALS COMPARED WITH MAN.

How Do They Differ from Us? Have They Minds? Will They Live Again?

BY J. A. CHITTENDEN.

In what respects the the dumb animals resemble man, and what are the limits of the resemblance, it may be well sometimes to consider. One difference that would first occur to most minds is that the brute animals have not the power of speech; next, that they have not thinking minds—that they do not reason; and, finally, that they do not possess immortal spirits.

Let us see how much they resemble us. In the matter of bodies containing the bony framework, the muscular covering, the arterial, venous, nervous systems, etc., they are like ourselves. They have sight, hearing—indeed, all the senses. Have they minds also?

The mind is that part which thinks, wills, remembers and reasons. Has the brute all these evidences of mind?

Some seem to regard the brute as a mere mass of organized matter endowed by its Creator with what they call instinct. That is, it has an inward prompting to est without knowing why it eats; it runs away from danger, but don't know why; it may run so long as possible, and when running will no longer answer, it will hide in the best place at hand or turn upon its pursuer in self defence, but never reasons about it. Men say it is instinct.

The bird looks about for the best place where it may build its nest. It examines this place, and that, and the other, and after a good deal of investigation makes a selection, and you are obliged to confess that it chose well with reference to convenience of construction and security from its foes. But men say it did not reason: it did not know why it made all that examination and finally decided or chose so well. This would be according to our ideas of instinct. Men have long so decided in regard to the dumb animals. They have set up a pillar, inscribed upon it "*Ultima Thule*," and have rested. No, not quite. Here and there the conviction has existed that there may be something more, and some have ventured to believe that the dumb animals have spirits that will live again.

Let us go back again to the place of beginning. It is said that animals have no language. But are we quite sure of that? They do call for each other,—the parent for the young, and the young for the parent—and they recognize each other's voice among many others. They They make plaintive sounds, and sounds for distress and rejoicing. What at least answers the purpose of language so far may go farther.

Animals remember. They do not forget their homes; and some animals do not forget that a neighbor has good provisions or good feed beyond the fence.

They remember their masters with good or ill feelings as the case may be. Having been trained to work, they remember how to do it, and do not need the same training every day. They sometimes have a grudge against a person, and manifest it on various occasions.

The mind remembers, wills and reasons. It determines to do a thing for a reason. Do brute animals *will* to do or not to do anything? I have seen a balky horse that evidently willed not to draw an empty wagon, and a few mornings ago I saw the sinch of a saddle tightly drawn on a mustang when I was satisfied, from his uneasy appearance, that he was meditating something, so I stopped to witness a scene. The man who was about to ride, or thought he was, led him around and finally leaped into the saddle. That which the horse had evidently meditated before he soon put into execution, and began to take positions and to change them so rapidly that the rider was compelled to take one in a ditch.

I once saw a cow, which had been left in the coral by the others, go out, walk down to the main road, go up in one direction a little way, stop and stand still a few moments, as if deliberating, then turn and go in the opposite direction. The acts had all the appearance of willing and reasoning. We cannot certainly say that dumb animals do or do not reason, but it is admitted by all that the workings of instinct resemble reason, and many who examine this matter cautiously ask, Do not the brutes give evidence of something more than reason?

I had a shepherd dog that, when I would say to him "The cattle are around," would immediately look in all directions for them. I sent him one day to drive the cattle up the hill-side. He did it well, then stopped and looked at me for further orders. He was too far off to speak to, so I motioned him further on. He instantly obeyed, drove them further, then looked to me, as much as to say "Will that do?" I beckoned him to me, when he came at his utmost speed, and on reaching me seemed much delighted that he had been able to serve me. A child could not have done better.

Many things that that dog did savored of reason. I never allowed him to go away from home with me, though he accompanied me as much as he pleased about the farm. I used to go about the place very much in hot weather without a coat, but always put it on when going to a neighbor's, or any distance. I finally noticed that my dog never presumed to follow me toward the road when I had my coat on, though he would look very wistfully. Must we set all this down to instinct, and say that there was no reasoning about it?

I had a horse that used to untie his halter when he pleased. I have tied three notes, sat down at his side, and seen him go right to work and untie it in as many minutes. It was only by taking a deal of pains every time I tied, that he seemingly *concluded* to give up the trial. Very many facts may be given concerning animals that indicate thinking and reasoning.

It is urged as another difference between animals and men that animals make no improvement; that birds, for instance, build no better nests now than when they begun to build them. To this it may be replied that each kind of bird knew how to make a first-class nest at the beginning. To deny this is an imputation against its Creator who taught them. If the nest was just the thing at first, then there was no need of improvement, and so of other animals. If the ostrich could cover up its eggs in the sand and have them hatched, there has been no need of its inventing an elaborate nest and then sitting upon them like a hen.

The animals resort to many contrivances to obtain food when they must. Hogs that once learned that a neighbor had a delectable field, used all sorts of strategy to get into it.

One reason given for the supposition that animals live again is, that they appear to have spirits, and that it seems reasonable that they should be immortal.

Another reason given why animals should be immortal, and particularly the domestic animals, is on the score of compensation. It is thought that those animals that are over-worked, ill-fed, or abused in any way during their short lives, should have another life which might be a happy one. They suppose that a benevolent Creator would give the abused animal an opportunity for a better life.

Finally, it would seem that no valid reason can be given why they should not live again.

If they are to live again, would not many men dread to meet the animals they have over-worked or abused in any way, when each may be supposed to remember all these things? I think that very many might wish that animals were not immortal, but there is doubtless a far greater number who would like to believe that the faithful animal that has served them might be happy in another life. One thing is certain, animals know the difference between kindness and cruelty, and, should they exist hereafter, will our memory and theirs reproach or applaud us?

The Vineyard.

Theory of Causes of Death of Grape Vines.

THE Napa *Register* offers the following:

A grape-grower with whom we conversed the other day advanced a theory and made some suggestions in regard to the decay and death of vineyards which are worthy of notice, and which may be of value to those interested in grape-growing. It is his belief that the damage done to vines by the phylloxera is not so great as is generally supposed, and that the chief cause of the death of grape vines is the severe pruning to which they are subjected annually, and to the profuse use of sulphur, which is used to destroy the mildew. As regards the pruning, he thinks that instead of setting the vines only eight feet apart and keeping them pruned down almost to a mere stump, it would be better to set them sixteen feet apart and let them run up to a hight of several feet (so high in fact that a man or a horse might walk under the branches), and to make the "head" of the vine at this hight, the same as it is now made near the ground. Cutting off the large branches and keeping the main vine stunted, makes it less healthy and vigorous and more liable to fall a prey to insects and decay. This theory is plausible and seems to be founded in reason. If the vines were allowed to grow larger, they would naturally be healthier, more productive, and longer-lived than at present. If only half as many vines were planted to the acre, it would be easier to care for them and to gather the fruit. If the vines were set out and pruned according to this plan, the gentleman who makes the suggestion thinks that we might as well have mammoth vineyards as an occasional mammoth vine.

The use of sulphur is believed to be injurious to grape vines. It is said to be sure death to gooseberries, and the inference is natural that it may be bad for grape vines. It is put upon the vines once or twice a year to prevent mildew, and falling upon the ground year after, a large quantity of sulphur becomes incorporated with the soil and has a blighting influence upon the vine. Some other means of destroying the mildew is believed to be necessary, in order to save the vines. These suggestions come from a man of considerable experience in the grape business, and are worthy of the investigation of others who have vineyards.

THE NEW PHYLLOXERA REMEDY.—*La Nature*, in a late review of the researches of M. Dumas relative to the practical efficiency of the alkaline sulpho-carbonates as destroyers of the phylloxera, affords us the following information upon the philosophy of the operation of this class of salts: The sulpho-carbonates of the alkalies are produced by calcining their respective sulphates with caabon, by which the mono-sulphide is produced, and agitating a concentrated aqueous solution of this carbon di-sulphide. The sulpho-carbonates obtained as here described, are free from disagreeable odor, are not dangerous to handle, are non-inflammable and comparatively stable. In the presence of acids, however, even of the weakest, and notably when acted upon by the carbonic acid, of which a moist, arable soil invariable contains a certain quantity, the sulpho-carbonate are decomposed into carbonates, with the liberation of carbon di-sulphide and sulphuretted hydrogen, both of which, and especially the first, are known to be highly efficient insecticides. It has been found that it is not only necessary to destroy the insects upon the vines and roots, but likewise to poison the earth in the vicinity of the same, and render it uninhabitable by them. For this purpose the sulpho-carbonate seem to be admirably adapted, inasmuch as, by their tardy decomposition, they furnish a slow but constant supply of the poisonous gasses for some days. Experiments have shown that 1,442 grains of the sulpho-carbonate of potassa will extermiate the insects from 198 to 284 cubic feet of earth, killing not only the phylloxera, but, likewise, the larvæ of larger insects. To apply the remedy, it is recommended to remove the earth from the foot of the vine about a foot deep and sixteen inches broad, into which is to be poured five or six quarts of water mixed with six or eight quarts of the sulpho-carbonate solution at 40° B. When the liquid is well absorbed the hole is closed, and the same process gone through on another vine. By following this method the penetration of the solution to the deepest roots is insured. Another method of application proposed by M. Dumas is to mix the sulpho-carbonate with twice its weight of slacked lime, and to strew the powder thus obtained upon the soil wherever required.

PHYLLOXERA.—August Mann, an experienced viniculturist at Big Oak Flat, Tuolumne county, sends to the *Chronicle* the following remedy for vines affected by the phylloxera, we give it for what it is worth: The phylloxera deposits its eggs on the bark next to the trunk of the vine. Rub off all the loose outside bark, gather and burn it, then take hard wood ashes, 20 pcands; strong salt, 1 pound; common soap dissolved in water, 1 pound. Put all in a boiler, and five gallons of water, and boil ten minutes; stir in the meantime; when cold apply it with a brush all over the vines, except on the wood of last year's growth, in the same manner as trees are whitewashed. This must be done before the buds open, so as to destroy the eggs before they hatch. My vines have been affected for years by the phylloxera, particularly the foreign vines. I have tried many different things to destroy them without success.

In the Spring of 1873 my vines showed all the signs of dying out. The grapes, immediately after the blossom, dried up, and the leai had a lifeless appearance. I then tried my remedy on a patch of Affenthaler vines which were the most affected, and to my great joy little leaves came out again. Satisfied then that I had discovered the right cure, I next spring applied it on all my vines before the buds opened, and as I expected the vines came out full of life and vigor, with large dark green leaves. I succeeded in destroying the leaf louse, and consequently the root louse, too, as the former is the producer of the latter. Those who try my remedy will in a short time from now, find out the truth of this statement.

Stated Displays at the International Exhibition.

The following stated displays, under their respective dates, will be held during the International Exhibition. Applications for entry may be now made, on forms which will be supplied by the Chief of Bureau:

AGRICULTURAL PRODUCTS.

Pomological products and vegetables, May 16th to 24th.

Strawberries, June 7th to 15th.

Early grass butter and cheese, June 13th to 17th.

Early summer vegetables, June 20th to 24th.

Honey, June 20th to 24th.

Raspberries and blackberries, July 3d to 8th.

Southern pomological products, July 18th to 22d.

Melons, August 22d to 26th.

Peaches, September 4th to 9th.

Northern pomological products, September 11th to 16th.

Autumn vegetables, September 19th to 23d.

Cereals, September 25th to 30th.

Potatoes and feeding roots, October 2d to 7th.

Autumn butter and cheese, October 17th to 21st.

Nuts, October 23d to November 1st.

Autumn honey and wax, October 23d to November 1st.

FIELD TRIALS.

Mowing machines, tedders, and hay rakes, June 15th to 30th.

Reaping machines, July 5th to 15th.

LIVE STOCK.

Horses, September 1st to 14th.

Dogs, September 1st to 8th.

Neat cattle, September 21st to October 4th.

Sheep, October 10th to 18th.

Swine, October 10th to 18th.

Poultry, October 27th to November 6th.

The above dates may be favorable for the assembling in Philadelphia of Societies and associations interested in the specialties above enumerated.

The right to amend or annul this circular is reserved.

A. T. GOSHORN,
Director-General.

BURNET LANDRETH,
Chief of Bureau of Agriculture.

Philadelphia, 1876.

Read our statement of principles on page 85.

Stock Breeder.

A FAIR DISCRIMINATION.

Fine Stock vs. the Pool-Selling Ring at Fairs.

COL. COLEMAN YOUNGER, of San Jose, a gentleman who has had a great deal to do with State and county fairs, and who knows the feeling of the people upon this subject, and understands the various games and manipulations of the horse-racers themselves as well as any other man, thus talks before the Short-horn Breeders' Association, and his sentiments are approved:

The cattle interest of this State needs fostering, and no one can do it to better advantage than the Stock Breeders' Association. The State Fair is intended to foster all our industries, and the District and County Fairs are expected to do the same in a local point of view, equally in proportion to their true worth. We ask the question, do the managers of fairs carry out this idea? In some cases we think they come far short of it, and there should be a full and frre discussion by this convention on that subject, and to give an expression to your views as to how fairs should be conducted, and especially so in reference to cattle. When any one industry has more than its due proportion of interest given to it, in money or time, all others suffer in proportion. If, for instance, cattle were to receive two-thirds of all moneys appropriated for premiums, it would be manifestly unjust to all other interests. Now, it is a fact that the managers of fairs usually give at least two-thirds of all moneys appropriated for premiums to the speed programme. Is this just or necessary to foster the industries of the State? And this is especially true of the State Fair. There were over $20,000 offered for premiums by the Board of Managers of the State Fair for the year 1875; and for the year 1874 there were given for speed purposes over $16,000 less the 10 per cent. entrance fee; the cattle premium was under $2,000. Is there any good reason why this difference should be made? Is the speed of the horse of so much more value than all other stock? Well, if so, give us the evidence. What is it in? Does that quality of the horse feed or clothe or furnish more of the necessaries or comforts of life to the people than all other stock? Our boys would scout such an idea. Then where does this superior value come in? Compare the value of the speed of the horse with the beef and dairy interest, the mutton and wool interest, the farming and manufacturing interest. Well, there is really not enough value in it to make the comparison. Separate the thoroughbred horse, either for running or trotting, and they would not be missed in counting the balance. But it is contended that the thoroughbred horse stands at the head of the list for speed. Grant it; but does he fill any other station to much advantage? I think not. Then what is there in him that $16,000 can be set apart for him during a single fair? There must be some good reason for this course. Does it arise from the vast fortunes that are made by farmers breeding them for speed? If so, who are they? Where one man has done well, thousands have been wrecked. I ask the question, what has given the race horse the great value that some place upon him? There is but one answer to the question: that his value is estimated in proportion to the amount of money that can be made out of him on the course. Then, if fortunes are made by his speed, is it the farming portion that do it? I think not. He has not the time, and but few have the disposition to embark in this mode of making fortunes. Then it is left at last to a few breeders and that other class of gentlemen who are fond of turf sports to make it popular. But we are told that the speed of the horse is grand and exciting, and commands the admiration of the world. Well, admit it. But, we ask, is it the speed alone we admire, or is it the vast sums of money that are staked on them that gives this morbid interest? To illustrate this idea: Was it the $30,000 put up by the San Francisco club that created the excitement, or the noted horses entered for the contest, that gave such state and national interest as to cause 30,000 persons to visit the course to see the contest at such enormous cost? Suppose these same horses had contended for a purse of $100, would 5,000 persons have visited the course to see it at the same rate of expense? I think not. If this is true, then the vast amount of money staked upon the result had more to do in producing the excitement than the horses did. The high estimate of speed is purely speculative, and that speculative interest is enhanced by the new and ingenious mode of investing on the result of all contests of speed, either of running or trotting. The managers of this new mode know from the percentage they charge that in time they have the lion's share, and it is to their interest to multiply these contests, which they take great interest in doing. Their percentage being enormous, they can afford to pay large sums for the privilege of furnishing a box for the people to deposit their money in. This new mode of investing on the result of speed has done much to bring these noble contests into disrepute and to lower it to a species of exciting and fascinating gambling. It is said men will gamble, and this is the most decent mode of doing it. Well, suppose it is; is that any reason for allowing them to outrage all our fairs? Is it commendable to make our fairs accessory to the carrying on of this dangerous and seductive vice? But the question arises, can managers of fairs afford, for the sake of money, to mold public sentiment against good morals to such an extent that fairs, as now managed, are made the most fascinating gambling places? Is this the result of fairs? Was it ever contemplated that this should be a prominent feature of fairs? Is this new mode of gambling any part of the industries of the State? Does it add any wealth to the State? If not, then why give it the fostering hand of an agricultural society? To say we cannot hold fairs without the aid of pool selling, is an insult to the intelligence of the people. It has been tolerated like Chinese immigration; but from indications the days of both institutions are numbered. We do not expect to control this institution for the present, for we know the powerful and active influences that are brought to bear to force it upon the public. If it is to be a state institution we propose to limit it to the course. We enter our protest against its being permitted at fairs. It is not one of the industries, and has no claim for public patronage. To allow it is in violation of the plain provisions of the law creating the State Fair. We have no desire to detract one jot or tittle from that noble animal, the horse; but we do object to the enormous appropriations that are given for speed, and the time that is set apart for it. There is no justice nor justification in the distribution of the money as now practiced, and we propose to insist on the managers of fairs making a more liberal adjustment among the great industries of the State that need and should be fostered by the State, and also by the institutions chartered by her for that purpose. We think our demands are just and should be considered. We know that millions are fed from day to day with our beef, mutton, pork and dairy produce, and that nothing can be adopted to take their place. The produce of the cow enters more largely into the consumption as well as the luxuries of the human family than perhaps any other article of food, and this is especially true of the farming community. This is only a part of the benefits. Take the wool, hides and offal, and the comforts and luxuries are continued until it ramifies every relation and condition of life. Now, taking this view of the subject, are we not justified in asking of the managers of fairs to give more consideration to the exhibition in these departments, as they have a value attached to them that cannot be computed? They should relieve us of many of the burdens and lessen our expenses as far as consistent.

THE AUCTION SALE OF FINE STOCK.

As this journal, for last month, went to press too early to allow of an account of the late cattle sales held at Sacramento under the auspices of the Short-horn Breeders' Association of California, we now give a review of the matter as made by the agricultural editor of the *Record-Union*, approved by parties we have seen who attended the sales. Probably yearly sales held in some stated place, the stock to be sold at private bargains, would result best for both buyers and sellers.

The sale of Short-horns that took place in this city on Thursday last fell far short of that success which its promoters anticipated for it. Breeders of these cattle have been meeting with very satisfactory success in the disposal of their surplus stock at private sale for a number of years past, and they had reason to believe that sufficient interest had been created in the public to sustain a good public sale. The experience of Thursday, however, demonstrates the contrary of this supposition. There is a growing disposition on the part of stock raisers to cross up their cattle with thoroughbred Short-horns. The dairymen of the State, at the present time more than at any other period in the history of the State, are buying thoroughbred bulls to grade up their cows, and there are more men of means and of lands stocking their farms with good thoroughbred cattle at the present time than ever before. Farmers generally are acting upon the axiom that good stock pays better than poor, and families in towns and cities who keep but one cow to supply them with milk, are more than ever inclined to buy higher bred and higher priced cows. These statements are all true, and yet the sale on Thursday under the Stock Breeders' Association, which was intended to give all these different classes of people an opportunity of supplying their wants, was poorly attended, and more poorly sustained by bidding. In the number of cattle sold and prices obtained, the sale was a failure. As an effort of the Association to wake up a greater interest in the breeding of fine stock, it was a greater failure probably than in any other respect. This was the second sale under the auspices of the Association, and both fell far short of anticipations, and far short of what they ought to have been. The causes of these failures constitute a puzzle to many of the breeders, and they are disposed to feel disheartened or discouraged in their efforts in this direction. On the contrary we think the trouble is easily explained, and that there is no real cause for discouragement. In the first place, such sales are a new thing to this State, and the people, even those who want to buy, feel a sort of diffidence in their own judgment, which makes them shy bidders. They would go the farm of the breeder and pay fifty per cent. more for an animal than they could be induced to bid for such an animal as such a public sale. To overcome this feeling, the Association have but to keep up the annual sales, and in a few years all will be changed in this respect. The public sales will become the popular resort of buyers, just as they have become in England and the Atlantic States, and the best prices will be obtained at them and the sales will have their intended effect in waking up and sustaining the public interest in good stock. Another special reason for the shyness of bidders is found in the fact that there had gone abroad the impression that the breeders had hit upon the public sales as a means of getting rid of their poorer class of animals, such as they could not dispose of at private sale. This suspicion was confirmed by the appearance of the animals offered. It is in the spring of the year, and the stock, however well kept, does not look as well as in the fall, when the public have been in the habit of seeing it at our State and county fairs. They were then prepared specially to show, while now they are just shedding, or have not yet begun to shed their old coats. They are comparatively thin in flesh and rough and languid. Buyers did not take these facts sufficiently into account. Time and continued sales conducted with honor will correct all these things. The sale on Thursday was conducted in the most honorable and open-handed manner, and all who attended became fully convinced of this fact, and this conviction will have a decided effect in favor of future success. The sales made at private bargains were much more favorable as to prices than those made by public auction, and a number of the animals placed in the catalogue did not make their appearance on the ground because they had been disposed of before the day of sale at more than fifty per cent. more than they would have brought under the hammer.

Pisciculture.

How to Take Salmon Trout.

EVERY year since 1872 we have been distributing salmon trout fry in many of our inland lakes. Those deposited in 1872-3 will be large enough to catch the next coming season, and there are but few people who know how to take them. I will give some hints on the different ways they are taken. They are taken with silver and brass spoon hooks, by leading the line so that the spoon runs near the bottom. But they are taken sometimes at the top of the water, and sometimes half way down from the surface, and by trolling with three lines at one time—one at the surface, one half-way down, and one near the bottom.

Another way is to anchor a buoy out in deep water and cut fish in pieces, varying in size from a hickory nut to a butter nut, and scattering the pieces around the buoy for some days; then anchor your boat to the buoy, using a piece of the same kind of bait on your

hook that you had been in the habit of scattering around your buoy; fish near the bottom, and give it a little motion by giving your line short jerks. The buoy should not be baited the day you go fishing.

Another way is to have a rod and reel and four or five hundred feet of fine, strong line, and if the water is deep put a lead sinker weighing three quarters of a pound on the end of your line, and tie a single gut leader twelve feet long on the main line, twelve feet above the sinker. For hooks, you should use nine No. 6 Limerick hooks, tied three together, back to back, so that they look like a three-pronged grapple. Tie them on a single gut leader, about two and a half inches apart, and you have a gang of hooks five inches long. Put two very small brass swivels on your leader. Use the kind of small fish for bait that the trout are used to eating in your lake. Hook one of the upper hooks through the under and upper jaw so that his mouth will be closed. Then hook one of the lower hooks through the back near the tail in such a manner that it will give the fish a curve and will turn around like a trolling-spoon when it is drawn through the water. The most successful fishermen use three of this same kind of rigs in one boat. They fish one rig near the top with a light sinker, say four ounces, and one about half-way down with an eight-ounce sinker, and the twelve-ounce sinker near the bottom. This is the most successful rig I have ever used. The boat should be rowed very slowly, so that you can feel the bottom with the heavy sinker nearly every time you raise it up and let it down. The bait should be raised up and down by a gentle motion; set the other lines one on each side of the boat, and they will take care of themselves. Live fish should be used for bait. Some use but eight hooks, one hook for the upper to hook through the minnow's mouth, and one to hook through the back near the tail, and two sets of three each between the two single hooks, tied about one and a half inches apart. Be careful and keep your minnow looking as natural as possible. Don't rub any more scales off than you can help. When you let your line out, your boat should be in motion to keep your bait from twisting around the main line.—*Seth Green.*

An Essay on Fish.—Fish may be divided into classes—codfish and fresh fish. The propriety of dividing them into classes will be at once apparent when we reflect that they are usually found in schools.

The mackerel is not exactly a codfish; but he comes so much nearer being a codfish than a fresh fish that he is for the present dealt with the former.

Fish exist in sizes to suit the purchaser, from minnows to whales—which are not fish, strictly speaking. Neither is the alligator a fish; but if we attempt to tell what are not fish, this article will far exceed its intended limits.

The herring is not absolutely a fish; he is a suggestion of departed fish. But the strongest suggestions of departed fish are smelt. The herring sustains the same relation to the finny tribe as the Egyptian mummy to the human race.

Fish are caught by measure and sold by weight—that is they are caught by the gill and sold by the pound. But they are sometimes caught by weight—till you get a bite.

Contentment is the chief respite to the successful fisherman.

Surveyors are apt to be good fishermen, because their lines and angles are apt to be all right.

The mermaid and fishwoman may also be mentioned in this connection. The former is a good illustration of what is meant by the ideal, and the latter as fitly represents the real.

Many land animals are reproduced in the sea. Thus we have the dog-fish, the cat-fish, sea-lions and sea-horses, but no sea-mules. None of the above have hind legs, and any manner of mule without hind legs would be a conspicuous failure.

It may not be out of place to mention Jonah in this connection. He was not a fish, but was once included among the inhabitants of the deep. There has been considerable dispute as to the name of the fish that swallowed the gentleman above-mentioned, some persons arguing that the throat of a whale is not large enough to swallow a man. This objection seems to be inconsequential.

Jonah might have been made in a smaller mould than other men. Moreover, it is certain that he was cast over before being swallowed—cast over the rail of the vessel.

There has been much speculation also as to the cause of Jonah's expulsion from the whale's interior, but the theory most generally accepted is that he soured on the whale's stomach.

He was very fortunate in reaching the land, since he had no pilot. If he had taken a pilot with him into the stomach of the whale he would doubtless have selected Pauncheous Pilate as the proper man.

Jonah was the first man who retired from the Department of the Interior, and Delano was the last one.

But we digress. Let us return to our fish.

The codfish is the great source of all salt. In this respect Lot's wife was nowhere; however it would be well to "remember Lot's wife."

The saline qualities of the codfish permeate and percolate the vasty deep, and make the ocean as salt as himself. Weighed in his own scales, he is found wanting—wanting considerable freshening. He is by nature quite social, his principal recreation being balls—codfish balls.

The codfish was worshipped by the Greeks; but he is only half as well treated by the inhabitants of Cape Cod—he is simply shipped. Hence the difference between the Greeks and the inhabitants of Cape Cod.

Small fish are usually harmless, but parents can't be too careful about permitting their children to play where large fish abound, as it is an established fact that the big fish frequently eat up the little ones.

The jelly fish is, perhaps, the best understood of all the finny tribe, because, being translucent, it is easy to see through him.

The greatest number of fish is eaten on Friday, and the next greatest number on Saturday, because those that are left over are warmed up for Saturday's breakfast.

Argumentative persons are fond of stating that it is grammatical to say that the five loaves and three fishes were ate, since five and three were always eight. They should be treated with silent contempt.

Fish are provided with air bladders, so that they can rise from the depths of the sea by simply filling these bladders with air. If any one is disposed to ask where they get the air for such inflation, let him understand in advance that this article is not intended for the solution of petty conundrums.

There are many interesting rumors about fish which might be mentioned, but the foregoing facts may be considered as of-fish-al.—*Detroit Free Press.*

A Large Lobster Pond.—Among the accessories of the market of Paris is one of the most curious establishments in the world—the great fish pond or reservoir of Roscoff, in the department of Finisterre, on the coast of Brittany. It is designed especially for lobsters, and for the supply of the Paris market with that crustaceous luxury. It has proved so plentiful in its results, however, as to afford occasional supplies to the markets of Belgium, Russia and Germany. It is an immense basin, some 1,600, or 1,800 feet in circumference, formed by solid walls of masonry, in which the waters of the sea are maintained at a uniform hight, with iron gates so constructed that the imprisoned lobsters cannot make their escape. Operations were commenced on the 4th of July last, when about 1,500 lobsters were consigned to hopeless captivity in the basin, and the stock is reinforced with about the same number every week by fishing boats engaged exclusively in the trade, which bring their captives, alive and amid all the horrors of the middle passage, to replenish the great slave bond. This is now estimated to contain about 30,000 lobsters, besides an equal number of mullets and fish of other species, which are enticed into the trap by the flowing tide, but, after having attained certain dimensions, cannot escape. Such a maride animal population necessitates, of course, a large alimentation, which is supplied by conger eels and dogfish, for which lobsters have a decidedly epicurean taste. The lobster is voracious at all times, but in regard to these luxuries his instinctive ravenous appetite carries him beyond the bounds of reason and leads to intestine feuds and desperate wars of conquest. So frequent is this carnage that lobsters in a wounded and disabled state are often found on the surface of the water. These are taken and sold in the immediate neighborhood, as they could not endure a long journey in a healthy condition. So successful has this experiment proved that measures are in progress for extending the idea to other desirable fish with which the shores of Brittany abound.

The clam is an intelligent insect. The legislature of one of the Western States once debated the question: "Which has the most intelligence, the clam or the codfish?" The weight of the argument was in favor of the clam, because it was proved that it had sense enough to keep its mouth shut when other people were talking, which was more than most civilized people ever do.

Horticulture.

Notes on Orange Culture in Southern Europe.

IMPRESSED by the growing importance of the culture of the orange to this county and State, and especially desiring in my own interest to study its practical workings abroad, I made in October and November last a short visit to those portions of Italy, Sicily and Southern France most noted for its culture, and propose giving here, briefly, a general summary of the observations made and information gained from all accessible sources during my visit, hoping that my friends of this State may derive some benefits from the result of my investigations.

WHERE CULTIVATED.

The shores of the Mediterranean, from about Nice to Genoa, properly known as the "Riviera," sheltered from the North by the Appenine Range, and with a sunny exposure on the Mediterranean, are rapidly increasing the culture of the orange and lemon, particularly the latter, the product of which has doubled within the last twenty years, and has gained one third in the past six years; its product being equal to the estimated crop of Florida—20,000,000.

To the north of Genoa there is at Lake de la Garde, in Northern Italy, under the shelter of the Alps, a sort of hot house culture of the orange, deserving mention here as a curiosity in its production for commercial purposes. In a space but little over twelve acres some 30,000 trees are cultivated in what is called *compote*, being thickly planted in terraces, rising closely one above the other in what might be called an amphitheatre, protected by boards and glass in winter, and this is at a cost of about $1,600,000 and yielding $77,000 per annum. I found also at Isola Bella on Lake Maggiore a fine orange grove growing on soil, bought to cover its rocks, from the main land, also sheltered in winter; but neither deserves serious mention as indicating the country of the orange.

Proceeding down the coast from Genoa, after leaving the protection of the mountains, no oranges are raised for commerce until Naples is reached, and here, and under the Vesuvian range at Sorrento, with its vast groves, and stretching along to Reggio, famous for the cultivation of bergamot, the production is on a large scale.

But in Sicily the production of oranges and lemons is carried on on the most extensive and elaborate scale; the regions of which Palermo and Messina are the ports, taking the lead with rapidly increasing volume. The province of Palermo, in 1854, had 11,165 acres of orange and lemon groves, producing $3,250,000; in 1874 there were 55,800 acres, producing $16,000,000!

The report from Sicily, in 1875, of oranges and lemons was 75,000 tons. In 1776 Messina exported 30,000 cases of lemons and 3,000 cases oranges, valued at $53,000; in 1874 Messina exported 80,000 cases of oranges and 300,000 cases of lemons, valued at $2,500,000. Its exports to America from 1862 to 1872 were 3,374,500 cases of oranges and 1,102,100 cases of lemons. In 1871-2 the exports were 521,000 boxes of oranges and 187,000 boxes of lemons to this country. The annual export of St. Michaels (Azores) to England exceeds 600,000 cases.

The lemon is also exported in other forms from Sicily. In essential oil, Messina alone exported, in 1872, 303 tons, value, $1,500,000. The annual exportation of lemon juice from Palermo and Messina is 450 tons; of concentrated lemon juice (60°) 1,500 tons; of cream of tartar 240 tons; citric acid and other products of lemon juice are for the most part manufactured in France and England.

CLIMATE.

The temperature in Southern France and Italy is as low in winter as in Orange county, in fact frequently lower. These countries suffer by periodical severe "cold spells" and traditionally every ten years have severe frost, and every fifty years a disastrous "great freeze." Thus in 1789, 1794, 1811, 1820, 1829, 1837, 1854 were very cold winters; while 1789 and 1820 are marked by the destruction of their orange groves, which, however, rapidly grew up from the roots into bearing again in a few years.

In Sicily there is no frost, though occasionally storms of hail or sleet which do great damage. But all these coun-

tries labor under a disadvantage common to all semi-tropical regions—except our favored peninsula, viz: A summer devoid of rain. For five months irrigation is necessary in the vast majority of their plantations, and whether by steam or horse power or hydraulic works, is very expensive.

SOIL.

The soil most preferred is calcarious clay, and those abounding in alkali are especially prized, but the richest soil does not produce the esteemed fruits. Thus, in the vast and fertile valley of the *Concha*, back of Palerme, covered with oranges of the most luxuriant growth, its products sell for one-third less than those of the same trees planted on Monte Reale, and other hills in sight, of poor calcarious soil, and whose fruits, prized especially for export, by reason of their quality of long-keeping, are known by the mark M (mountain).

The effect of the soil on the quality of the orange is a well recoguized fact, and at Nice, which abounds in beautiful orange groves, it is freely admitted that oranges deteriorate in quality in its inferior soil. The peculiarly delicious fruit of Florida I ascribe mainly to the character of its soil, abounding in that prized substance, alkali, the products of fires which have annually overrun its surface, and in vegetable *debritus* and lime, the product of decomposed shells.

PROPAGATION.

The system universally adopted is to bud the sweet orange upon "sour stock," as we call it. This is obtained by planting the seed of the bitter sweet orange, which is but one of thirty-one varieties cultivated of the *Sphesdric*, or so-called "wild orange." The reason for preferring the sour, or bitter-sweet orange stock to the sweet one, is that it is hardier, less subject to malady than the exotics, more precocious and grows faster. According to very exact observations by the Royal Agricultural College of Sicily, in ten years it gained 50 per cent. in diameter over the latter.

The orange is picked when fully ripe, in March, of the largest size, rotted in the sun, and then washed out, those that float in the water being rejected, as well as all imperfect ones or those wanting in plumpness. They are sowed soon after separation from the orange (the wild orange seed loses quickly the power of germinating); the sweet seed can be kept for years; both can best be preserved in sand; soaking in water is expedient for dry seeds which otherwise would not germinate;) in rich, deep beds, with a warm, sunny exposure about one inch from the surface and are abundantly watered and manured—observing constantly the axiom that warmth and humidity are the essentials of germination—when they are removed to the nursery, great care being taken to preserve the tap as well as the lateral roots. Here again the greatest care is taken to have rich, deep and thoroughly cultivated soil in a sheltered location; they are planted about ten inches apart; watered by irrigation at regular periods, manure and cultivation being frequently applied. In three years from the seed they should attain the necessary growth for budding. This is practical when the tree has reached the size of an inch in diameter about six inches from the ground. All the old groves are budded close to the ground, but experience has proved that protection from the scourge of a wide-spreading disease called the *gamma*, is better secured by making the trunk of the tree hardier stock, consequently the bud is inserted six feet from the ground.

The bud is taken from a bearing tree, and in its year of *full* bearing, not its *off* year. In the spring months trees are budded as well as in the autumn, from August to November. In the first case the trees are topped; in the latter (called dormant bud) no branch is removed till after it has started the following spring. Trees are also propagated by slips made from the suckers or green growth, called *plumet*, which is generally carefully pruned from the tree whenever it appears. Such trees, however, have no tap roots, are short lived, and are not esteemed, though they develop quickly.

Another form of propagation practiced in pleasure gardens is by what is called "Marcotte," which is surrounding a limb previously scarified with a sort of wicker basket filled with earth. After a year the branch is cut off and planted and gives speedy fruit. It also is short lived.

Sweet seedlings are almost invariably denounced by those who cultivate fruit for commerce, as of slower development, (four years longer than budded trees) of uncertain and inferior character of fruit, and by reason of the thorns, which injure it when shaken by the wind. Its size, too, is considered a disadvantage for gathering, and its superior quantity is not regarded as compensating for its inferior quality. Where 100 seedlings fill an acre, 200 budded trees have ample room. Budding, besides, promotes sweetness in the fruit. I have thus seen trees budded on successive buds two or three times to secure a high quality.

PLANTING.

The trees, which generally are from three to six years old, sometimes just ready to bear are planted when vegetation commences—in Italy generally in April. The holes—three feet by three feet in rich soil, from four feet to four and a half feet in depth by the same width, in poorer soil—are generally dug in summer in order to expose the earth to the action of the air. When planted the tree top is cut back to correspond with the dimensions of the roots; the hole is one-third filled with rich, decomposed manure, mixed with the top soil, heaped up in the center, upon which the tree is planted so as to set it deeper in the ground than before. The earth is filled in and left in a saucer shape—depressed around the tree—and plentifully watered. There are various practices as to the tap root. Some cut, some bend, others leave it entire. In a large grove, just planting, which I visited in Sicily, its proprietor an intelligent Englishman, bent the tap root and said that he thus forced the surface roots down—a great object with all cultivators as a security against drought and leaving the top soil free for cultivation.

The base line for planting is generally laid due north and south, in order to give all the trees equally the benefit of the sun. The present generally-received distance between the trees is fifteen feet on the level, twelve feet on the hill sides (although most of the groves I have seen are under twelve, and in some the trees are six feet apart). The modern system of planting, too, is in diamond quincunx, instead of squares, by which plan, with the same space to each tree, eleven per cent. of trees is gained to the acre.

The latter system, too, is to bud the tree only after having been transferred to its place in the grove. The cultivator is generally employed to stir the earth around the trees to the depth of six inches three times a year, and as before said, great importance is attached to keeping down the surface roots.

MANURE.

Until the tree bears, the growth of its wood is promoted by abundant supplies of manure of strong, active character two or three times a year, according to age and soil. When in bearing, manures of slower decomposition are applied from once a year to once in five years according to soil. It is applied to the surface over the roots and especially at their extremities, supposed to be bounded by the extent of the branches. This is turned in the autumn ten or twelve inches deep; liquid manures are applied in the summer when vegetation is most active. Water applied to the roots or over the trees at regular periods of six or eight days, is a great fertilizer by reason of the various salts held in solution, as well as a remedy against drought. Plaster of Paris is sometimes sprinkled over the tops of the trees and is absorbed by the leaves to their benefit.

REMEDIES AGAINST DROUGHT.

With five summer months devoid of rain, the means of obviating the effects of drought are all important to the cultivator. Irrigation is generally practiced and is called wet culture, in contradistinction to dry culture in vogue at Naples, Sorrento, etc. This most expensive method consists in deep trenching. I have seen groves trenched eight and a half feep deep. Constant culture of the soil and sometimes mulching are employed to retain the moisture below the surface. In irrigation, which is universal in Sicily and the Ligurian coast, steam and horse power, and sometimes extensive dydraulic works in sinking and conducting springs from the mountains' depths are employed. Care is taken that the water be of the temperature of the air; it is applied weekly during the dry season, from May in Sicily and June in Northern Italy and France, till September, and at night; in autumn, however, in the morning, the cultivator following a few days after. Conducts of brick or stone are led across the groves (and crossing at right angles) from the reservoirs, and supply the numerous trenches which cover the soil around the trees, in scientific order.

PROTECTION.

The wind is a greater enemy of the orange trees that the frost, in Italy and Sicily, either by their violence or by reason of prejudicial character in itself; and in the location of groves great attention is paid to protecting them, whether by mountains, woods or artificial screening, (walls, plantations, or wooden structures) on those sides whence the most pernicious winds come; (in Italy north and northwest, in Sicily southwest and south-southwest, which is sometimes most destructive with hot blasts from the African coast.) Trees, for this reason, are frequently kept low by early pruning.

The sea-winds, *brina*, are in themselves noxious to the plant, as are the African winds or siroccos, by reason of their heat. The strong *brimate* of 1873 decimated the oranges around Palermo, while the mandarin, which is a hardier fruit, did not suffer. The eucalyptus is now frequently planted on exposed sides of groves as a protection. I am inclined to think, however, that the influence upon the orange tree will prove prejudicial, as, like the ailanthus, it is noxious to many plants. I have seen rows of wild cane planted thickly not only on exposed sides but between every fourth and fifth row of trees. Again, I have seen high frame works of cane erected to break the force of the wind. High walls are sometimes used and the sheltered hillsides are terraced, with immense labor and cost, to their summits to avail of every foot of shelter.

In the Azores, at St. Michaels, I remember to have seen in their *quintas* (orange groves) walls of huge stones, eighteen or twenty feet high, erected for protection from the winds, and planted against these, thickly, the tall and quick-growing *faya* tree, which added thirty or forty feet more elevation for resistance to the strong winds which sweep over the island.

MIXED CULTURE.

The practice is almost universal of occupying the ground between the trees, until the second or third year of bearing, with other cultures; with vegetables, which is preferable when near towns that offer a market; with vines or fruit trees under other circumstances. The peach tree, which lives ten years in Italy, does well planted with the orange, and disappears at the right moment. I have seen accounts of groves to which mixed culture had been applied, when, by the time the trees were in bearing, all the expenses, including the cost of the trees themselves, had been paid by these crops.

PRODUCTS.

A great business is done at Nice and in the neighborhood in orange flowers. The wild trees are cultivated for that purpose, and are superior to the sweet—those of the highland being superior to those of the low. The leaves, too, are an article of commerce. The flowers are gathered all summer, shaken on sheets when dry, and distilled with equal quantities, by measure, of water. The wild orange averages 80 pounds, the sweet 40 pounds per year per tree. I remember one wild tree in Nice yielding 440 pounds of flowers and 4,000 oranges in one year. Two hundred pounds of fresh flowers yield 80 pounds of double and 20 pounds of single orange flower-water, and half a grain of essential oil—*neroli*.

FRUIT.

There are three gatherings: the first in November, when yellowish, and solely for export, and is the dearest; the second in December and January, when half ripe and full yellow color—the cheapest priced; the third in March, when quite ripe and unfit for export—these bring a high price. The sales are made on the trees to merchants, as they stand, or per thousand (merchantable), 1,040 being reckoned as a thousand, and in some districts 360 pounds, or again, the grove is rented for a term of years.

PICKING.

They are picked by breaking the stem, deposited in baskets lined with cloth, then piled upon straw, after the stem has been cut down close to the fruit, and sweated for three days in darkness under cover. They are then culled for market.

MARKET.

The merchant sends his own sorters, and thirty-three per cent. of oranges, sixty-six per cent. of lemons, is the average number of merchantable fruit. All the least imperfections, the abrasion of the skin or loss of stem insure rejection. The oranges are then papered and packed in boxes for transportation to the merchant's warehouse and never sent in bulk. Here they remain a week or two to permit them to develop any latent defects, when they are again inspected and twelve to fifteen per cent. thrown out. They are then assorted according to size, repapered and carefully packed. The baskets, the bins, sorting and papering tables being carefully padded to prevent abrasion of the epidermis. The fruit for export is of three sizes, numbered respectively 25, 30, 42, which represents

the number per layer in each compartment, containing 200, 300, 420 respectively. Lemons are marked 23, 30, 36, 49. Number 36 being the best.

The element of durability enters largely into the price: the *roba fute* (hard skinned) sells for double the *roba flacca* (soft skinned). The average prices of oranges in Palermo, in 1873, were from $3 50 to $5 per thousand.

The paper used in wrapping is a thin tissue manufactured mostly in France. Boxes of beach wood are in great part furnished from Maine, sent out in shooks, with hoop poles to match. by the cargo; the sides and top are each of two pieces. The oranges not fit for export are sold in the local markets, and are packed in puncheons pierced with holes, containing about 1,000, having at the ends and middle abundant layers of paper or straw, and shipped (as our barrels of fruit should be) on their sides.

LEMONS.

The culture of this fruit is assuming enormous proportions in Sicily, being much more profitable than the orange, and supplanting it for that reason. I have seen bearing orange groves topped to receive lemon buds. It yields four crops, comes into quicker and heavier bearing and its uses in arts and medicine—for citric and tartaric acid and essential oil—make it necessarily of greater permanent commercial value than the orange. It is exported every month in the year. Its average yield in Sicily is 1,000 to 1,100—that of the orange 600 to 800. It is relatively higher priced than the latter by reason of the greater durability and medicinal and commercial uses.

A careful estimate, made lately, taking a large number of groves in Sicily under similar conditions of soil, etc., shows that in culture on a large scale the average annual yield of the lemon is $300 per acre, and on a small scale $150; while the orange gives $175 and $90, respectively, from the same area of land, and with the same outlay.

A disease of modern origin, the *gamma*—already adverted to, is causing extensive ravages in Sicily and wide-spread loss and alarm. The disease which first appeared in the Azores in 1832, and which destroyed one-third of the orange groves of St. Michaels, was introduced thence into Portugal in 1875, and has since spread over the orange lands of Europe, making its first appearance in Sicily in 1863, where it has been particularly destructive to the lemon, while the oranges are little affected by it. The characteristic of this dreaded malady is a cracking of the bark near the root from which exudes gum; these cracks extend upwards; the gum-tears (*lagrema*, the Italians call it) trickle down in large quantities, the leaves turn yellow, the bark peels off around the cracks, and the root, too, is finally attacked, and the tree soon succumbs. The production of the tree would appear to be at first stimulated by its presence, an unusually large crop being often an indication of it. A tree once attacked rarely survives. I have seen some where deep incisions, the application of hot iron, etc., at the outset had checked the further development of the disease. In a recent report by the French Consul at Messina to the "Society of Acclimation," of France, of which I am a member, this devastating scourge of the lemon is ascribed to over-stimulation, causing excessive production of the tree. Space will not admit to refer here to other diseases of the *citrus* family and which deserve mention in a special treatise.

In Sicily I was told that the orange and lemon could be raised with a profit at one dollar per thousand, although the present return to the cultivator is about $3; and yet Florida is far superior to Sicily in climate and productiveness of soil, in cheapness of land and vicinity to market. A grove just planted near Palermo, consisting of twenty acres, which I visited, cost its proprietor $20,000, in gold, when ready for planting. His irrigation is by steam power—an English engine, supplied by English coal, watered the ground for five months in the year. Of the products of the grove—the average in fact for the island—but twenty-eight in a hundred were exported, and these enveloped in French paper, and packed in American boxes, shipped in English steamers with thirty-five days' voyage to New York and twenty-five per cent. loss on the voyage; compelled to pay on arrival a duty of twenty per cent. (which the State of Florida is indebted to me for) this sour, half-ripe fruit cannot, I think, long venture to compete with the luscious orange of our own favored land.

I say, therefore, to the Florida orange grower that he is not only certain to supply, to the exclusion of all others, this great market of America, but his superior fruit is destined to supply the tables of the wealthy in Europe, who will pay dearly to obtain this luxury which Europe cannot furnish.—*H. S. Sanford, in Semi-Tropical (Florida).*

PRACTICAL HEALTH TOPICS---NO. 4.

Rest and Recreation.

BY "JEWELL."

I AM sometimes led to believe that really we Americans don't know the meaning of the word *rest*, we generally take so little of it. Our men are so full of the eternal money making, that they bring the same spirit of intensity into both their rest and enjoyments. Even the women and children of our land are imbued with the same desire of doing or being something for money. Half of our girls, and all our boys, are studying to-day at school, college or workshop that they may some day *get rich*. Perhaps they wish to excel; but why? Only to get a higher start in life and gain the highest places and be richest. So they are urged forward, by teachers and parents, until their brains are overtaxed, and they cannot rest, and hardly play as they should, so the body fails, and before they are men and women they are *old*, with little apparent desire for rest and recreation, because it is too irksome.

Our pleasures are becoming intensely laborious. We need a greater diversity of work and recreation. At picnics I have watched the youths of both sexes engaged in dancing, and verily believe that even the hay-field or wash-tub did not cause the same amount of hard work and perspiration that the mazy dance did. Another thing I noticed, that the very young men and girls that were strong and hearty danced the hardest, and the slim, pale girl was better content to walk and chat with a companion than to exercise the unused muscles as she needed to do. But was the pale girl resting? Not a bit of it. She felt equally weary at night, because she was using the brain when she ought to have been using the muscles and getting blood into them.

The school teacher, editor and minister who use the brain all day cannot rest by reading and studying out of hours. They need quiet to aid digestion, and active exercise to bring the blood from the brain into the extremities and muscles of the body, in order to equalize the blood and give growth to the entire body. And yet they are the very ones who seek quiet enjoyments without regard to health; while the robust farmer's boy and girl, who cultivate the muscles continually, and might really rest by quiet conversation and reading, or attending a lecture, thus cultivating head and body alike, are usually better pleased with merry-making and muscular games and break-down dance—perhaps riding miles after a tedious day's work, to enjoy such a frolic.

Another evil in our way of resting is, that we rob the hours of sleep for most of our recreations. Lectures, concerts, dances, and all but picnics (the latter, by the way, I am glad to see gaining ground in our society ways of late) are in the evening, often continuing until dawn. And even our church revivals have taken up the fashion of late hours, and frequently keep running until near midnight. Surely the reign of *muscular* Christianity will not long last at this rate.

Inactivity is not always rest, and a large majority of our women to-day need the exercise of muscle out of doors in pure air to be strong and healthy. Physicians are beginning to prescribe the "lift cure" and "movement cure" in certain forms of disease, with excellent success. But if our habits of life were more in conformity with nature's laws, so that the brain and muscles were harmoniously developed, and common work was not considered degrading to the well-to-do, all would be healthier and happier. Civilization is a failue when one half of the people are over-worked, with no time for pleasure and rest, and the other half have not enough to do to keep them in health so as to enjoy life, and all are on a mental strain to get or to keep wealth.

The Improved Underwear.

ED. AGRICULTURIST: In the March number of the AGRICULTURIST I saw an advertisement of the combination underwear for ladies and children. Having long hoped and looked for something of the sort, I at once got patterns and made the garments. I therefore feel doubly like recommending them to the ladies everywhere. The patterns seem perfect in every point of view, viz.: cheapness and simplicity of make, and fitting the body easily, at the same time covering it entirely, thus insuring an equal distribution of clothing over the entire surface. I would like to suggest to the patentee that engravings of the garments would greatly add to their sale and attractiveness. The women want to *see* what style of clothing we are going to make in these days of cheap patterns, and hope the "C. C. C. Company" will not only have cuts of both under-suit and outside waist, but will advertise them largely with illustrations to let the ladies of California know what they are like, as well as where they may be obtained, both patterns and made suits.

A MOTHER.

The Cho-cho.

This is a vegetable commonly cultivated in the island of Jamaica, and is evidently the one referred to in the Tampa *Guardian* under the Spanish name of *Chayote*. There are two varieties—the white and the green. The latter is the better of the two, being more delicate. They are about the size of a Cluster cucumber—larger at one end, and slightly tapering off. In the West Indies they are sometimes grown on arbors, but more frequently are planted at the root of a tree. They grow very fast (several feet in a night), and will cover the top of the tree with vines, hanging down all around. The vines bear profusely. One will furnish a peck a day. So common are they in Jamaica that they sell in the country at about 10 cents per peck. They will thrive in any part of the Southern States, for when the vines are killed by frost, they only require to be cut off, and the roots covered with straw, and in the spring they will grow again.

To cook them, first split in half, lengthwise, and boil until quite tender; butter, and sprinkle with black pepper; or mash up like squash and treat in the same way. They are more delicate than squash. Apple-sass can be made from them by the addition of lemon juice and sugar, so that we defy the greatest connoisseur to tell the difference. They should not be planted until they sprout, and then plant with the sprout end slanting downwards, and cover very light; in fact, they hardly require to be covered at all, only placed below the surface, for, if covered, they rot. The vine will last for years, bearing all summer. Those who grow them can have apple pies without apple trees, and no doubt they could be cut up and dried for winter use the same as apples. The cho-cho should not be too old before used. If the finger nail cannot penetrate they are unfit for food, being too tough.—*Florida Agriculturist.*

The Moon's Influence.

The notion that the moon exerts an influence on weather is so deeply rooted that, notwithstanding all the attacks which have been made against it since meteorology has been seriously studied, it continues to retain its hold upon us. And yet there never was a popular superstition more utterly without a basis than this one. If the moon did really possess any power over weather, that power could only be exercised in one of three ways—by reflection of the sun's rays, by attraction, or by emanation. No other form of action is conceivable. Now, as the brightest light of a full moon is never equal in intensity or quantity to that which is reflected toward us by a white cloud on a summer day, it can scarcely be pretended that weather is affected by such a cause, That the moon does exert attraction on us is manifest—we see its working in the tides; but, though it can move water, it is most unlikely that it can do the same to air, for the specific gravity of the atmosphere is so small that there is nothing to be attracted. Laplace, calculated, indeed, that the joint attraction of the sun and moon could not stir the atmosphere at a quicker rate than five miles a day. As for lunar emanations, not a sign of them has ever been discovered. The idea of an influence produced by the phases of the moon is therefore based on no recognizable cause whatever. Furthermore, it is now distinctly shown that no variations at all really occur in weather at the moment of the changes of quarter, any more than at other ordinary times. Since the establishment of meteorological stations all over the earth, it has been proved by millions of observations that there is no simultaneousness whatever between the supposed cause and the supposed effect. The whole story is a fancy and a superstition, which has been handed down to us uncontrolled, and which we have accepted as it came from our forefathers without questioning for a reason.—*Ex.*

Treat laboring man and beast well.

Household Reading.

MOTHER.

A COMPOSITION BY WM. PEARCE.

THE name of mother should be held sacred in the memory of everyone. In the name of mother is embodied something that mortal lips cannot interpret. In the true sense of mother there is found something that gives joy and peace of mind (when tried with the battles of life) that nothing else can give. Show me a man who does not cherish the love and attention paid him by his mother in his childhood days, and I will show you a man who has not a spark of that affection and love that he should have for himself and his fellowman. A man cannot be a friend to himself and disregard the love and affection shown him by a mother. Ah! I fancy I see a man, who has drank deep of dissipation, and who has defied the laws of the land to effect a reformation, dragged from the haunts of vice and sin, and even farther—yea, I may say from the gallows and the drunkard's grave, by the sweet recollections of a mother's love. Her influence has taken hold of the tender cords of the heart when all else had failed. Many there are who do not fully appreciate the present love shown them by their mothers—because that love, to them, now seems small—until separation takes place, either by the solemn messenger of death or by being called to other climes—not till then do they know how to appreciate and value a mother's love. If by death our mother has been taken from us, we should cherish her memory in love, which we do in the following

TO MY MOTHER.

Mother! Sweet Mother! O where canst thou have gone?
Since long have thy children been wandering alone;
Though far we have roamed from our own native shore,
No home have we found like the dear home of yore.

Mother! Sweet Mother, why speakest thou not
To those of thy bosom who forgetst thee not,
Nor look, when in childhood we shared thy dear love,
With blessings invoked from heaven above.

Mother! Sweet Mother! must we plead in vain
To hear but a word from thy loved voice again?
Thou often didst speak of a world bright and fair
Where dread death and sorrow can not enter there.

Mother! Sweet Mother! thy cheeks were all cold,
Thy eyes are closed, which shone with pure love untold,
Thy true longing spirit hast taken its flight
To dwell in the regions of heavenly light.

Mother! Sweet Mother! thou art freed from all strife,
From the cankering cares and burdens of life,
No harsh sound of discord shall e'er grate thy ear,
The sounds of sweet music are now with thee there.

Mother! Sweet Mother! thy lone grave shall be strewn'd
With flowers that emblem thy happy abode;
Brightly will they bloom o'er thy grave and around,
And bold sacred to trust thy dust in the ground.

Mother! Sweet Mother! we may not live in vain
If 'tis in the hope of our meeting again
In the land of the blest, where only is bliss
And unknown are the cares and sorrows of this.

Mother! Sweet Mother! our abode shall be bright
With radiance shining of heaven's own light;
Our breathings shall be of the heavenly air,
And sweetest bliss shall be ours forever there.

SAN JOSE INSTITUTE, May, 1876.

Health first, then comfort and competence.

MUSINGS.

BY MRS. D. C. GUNN.

In the hurry and bustle of life do we ever pause to realize the beauty, the wonder, and the use of the world we live in? Amid all the worry and trouble of this existence, do we ever take breath long enough to account some of the many wonderful results that man has accomplished? Listen! "In the beginning God created the heaven and the earth," and man finds himself upon a globe with its mighty oceans, vast plains, lofty mountains peering into the sky, and dense forests, while above all is the blue vault of heaven with its sun, moon, and starry hosts. For what purpose was this glorious world created? For whom exist the legions that fill the animal kingdom? Beneath the dark water live countless numbers of the finny tribes; over the mountains and plains wander over variety of animal life, from the animalcule too small to be seen by the unassisted eye to the giant monsters that prowl in dark and tangled glens; everywhere the woods and groves are melodious with the music of nature's sweetest songsters, the beautiful birds. For a noble purpose, and for man who was formed "a little lower than the angels," this world exists. Placed upon this earth, ignorant of its resources, helpless in the extreme, how great have been the deeds wrought by the human race! By man's inventions and skill he has traversed the pathless ocean, dividing the world into its great divisions, establishing vast empires; mighty nations, who have builded magnificent cities, and whose power and importance were once the wonder of the world. Though many of these are now in ruins, there comes down through the long vista of ages past an influence upon civilization which is still perceived. Man has linked the past to the present by a long chain of discoveries and inventions that gives to the nineteenth century not only the glory of the past, but a history of its own that will be felt until the end of time.

By the care and industry of man, earth is made to yield her richest productions of the vegetable kingdom. He has penetrated the deep recesses of the earth, bringing forth rare and beautiful gems. By his genius he fills the world with the choicest treasures of poetry, painting, sculpture and music.

"In fields of air he writes his name,
And treads the chambers of the sky."

With all these achievements he is not satisfied, but is still marching upward and onward, In estimating the greatness of human nature, we must remember there are several kinds or orders of greatness, and among them I would place first *moral* superiority, or magnanimity, then *intellectual*, and lastly greatness of *action*, or the accomplishment of some vast perceptible effects. In each of these orders there are many examples of individual greatness, but volumes would not be sufficient to tell of the exploits of the heroes of the world. Every civilized people has contributed to the honor and glory of the past its many glorious examples.

By the side of the bright and glowing record of man's greatness is another one of darker import, blotted with tears of the suffering, with cruel oppressions, bloody wars, and with all the crimes that have blackened the history of the world since its creation. But upon this I will not dwell. It is all sufficient for us to know that from this chaos of human misery Divine Wisdom will bring forth a glorious ending, when all shall be governed by the principles of truth and justice, when charity and love shall go hand-in-hand with strength and power. Goethe says "on every hight there lies repose." When that highest of all hights, goodness, perfect knowledge, and love, is reached, may we not hope that there will be sweet rest and peace for those who have acted well their part in this fitful dream that is called life?

GRANDFATHER'S LETTERS---NO. 9.

MA AND ANGIE WRITE TO INGLEWOOD.

Dear Inglewood: Although we all know by this time who Inglewood is, and in your visits we shall know you by your real name, for your present purpose you can retain that of your choice, the *nom de plume*. Aunt Mary insists on turning over the correspondence to other hands. She says she has found out enough of Inglewood to recommend and invite him as a visitor to the Hill-side Farm. Such is the confidence we always place in Aunt Mary, I cannot but heartily coincide. If your sentiments and principles, on further acquaintance, prove as good as those expressed to Aunt Mary, I shall feel honored by a more intimate acquaintance; and that may lead to a membership of the family—this, however, is a matter for you and my daughter Angie to look to. Friends' and even parent's wishes are not always attended to in these matters. You have seen enough of the world (for you are not like a man in or just out of his teens) to know there is an individuality peculiar to everyone, and it is best to see that individuality under different phases and circumstances to form anything like a correct judgment of it. So I do not extend an invitation to you for a set time, but just drop in as you feel disposed to, and there will be no lack of opportunity to learn something more of Angie, and for a display of your own sentiments and principles. This sudden attachment, falling in love at first sight, as it is called, I am not much in favor of. I know there is such a thing, and occasionally it turns out well, but often the reverse. On the other hand, we sometimes come in contact with those towards whom, at first, we feel quite indifferent, but who, by a continual display of qualities which excite and draw our attention, love, kindness and sympathy, change our indifference to feelings of love and admiration. This is the kind of love and admiration I am in favor of, and which I endeavor to inculcate in others. It grows with our growth and increases with our years, till it may reach that climax that we may anticipate even death itself will not blot out those soul faculties from existence. Such, Mr. Inglewood, may be your faculties and mine, and continued into the next sphere.

Yours, respectfully,
MRS. SARAH MORFATT.

P. S.—*Mr. Inglewood:* In accordance with Aunt Mary's and dear Ma's insisting wishes, I break silence in reference to your note, but only as a postscript to Ma's letter,—you must remember that will be quite enough to begin with—and express my wonder at what you could have seen in me to attract your fancy. When Ma told me your object, I exclaimed, "Why, he is old enough to be my father!" so it was an object with Ma to soften down this disparity of years. What does Mr. Inglewood say to this disparity? I cannot but think it objectionable, though Ma does say there are some decided advantages in it—that remains for you to show in one of your visits.

Since I, also, am out of my teens, I expect not to be treated as a child, but as a woman, and as one who has had the benefit of those who have preceded me in the same line, and who, on this and all other matters, counsels her mother—her dearest friend up earth.

This trio, Aunt Mary, Ma and I, have many a serious conclave in reference to me and my future, I do assure you. On the one hand, warning me how I listen to your fascinating, endearing phraseology; and on the other, how I place myself in a repellant mood. Really, they treat the matter with such serious gravity as sometimes to have a depressing influence on my spirits.

In this commencement of our epistolary correspondence, I have been thus frank, plain and sincere with you, and intend to continue so to the end, with a request that it may be so on your part. If in our personal communications there are excuses for our omissions and commissions of an indiscreet nature, there can be none in our epistolary, for here we can review our thoughts before speeding them off. So, till we hear from you again, we three, Ma, Angie and Aunt Mary, a trio, remain your friends in sincerity. —ANGIE M.

UP-COUNTRY LETTERS---NO. 5.

BY RACHEL A. ELY.

Spring is upon us—charming, joyful spring—with its singing birds, noisy crickets, bursting buds, smiling buttercups, and soft, emerald grass, over which my frail foot steps love to linger, and daily I take my quiet walk to the big, old trees, and stretch my poor limbs upon its soft, velvet bed, in the warm sunshine, and doze, and read, and think, and sleep. Yes, actually, sleep overtakes my brain, and I awake so refreshed that I wish every poor invalid in the universe might feel as I feel, and grow strong as I do, in body and spirit too, for my kind, good hostess is giving me mental health as well as bodily strength. It seems as if a new revelation were unfolding to my eyes, and that God's laws were but just being understood by me. I wonder as I remember, years ago, while I was heedlessly, ignorantly, entering the downward path of disobedience to His laws, from which I suffer today, and have suffered untold agonies, how I could have so blindly fallen, all the time attending divine service each Sabbath, until my health failed entirely and I could not leave the room, when the good pastor came to me, and read and prayed for the soul's health, but not a word for the body's sake, that "living temple" that holds the soul and its aspirations. I begin to see light ahead now, and wonder why our ministers don't take up the good tidings of obedience to God's *physical* laws with the moral and spiritual law combined. Ah! if they could but listen to my brave, kind, little teacher, living such a quiet, domestic life among these mountains, surrounded by her little children and home duties, but doing her duty so bravely and earnestly, surely they would feel as I do that His servants are many, and much scattered among His children, and not always wearing the badge of honor among men because of their fine oratory and brilliant churches. Blessed simplicity of truth and nature! Let me with open eyes behold thy wondrous teachings, and try to obey thy laws, believing as I do that it is only through them that our *bodies* can be strong to do the moral and spiritual work for ourselves and others.

The sick woman at whose house I first made my home is no better; indeed, her doctor has given up the case, and calls

in a friendly way every few days, but after exerting his utmost skill in drugs says nothing more can be done, and leaves her to die! Poor woman! and wise doctor! My hostess has been to offer any aid, and says there is hope while there is life, and cooled her head and gave her a rubbing bath, which was followed by a sleep of an hour. How I do hope that she may recover under my friend's advice and treatment!

HAVE A HOME.

BY ISAAC KINLEY.

Dependence debases. Few minds are able to resist its depressing influence. The tendency of subordination to the will of another is to destroy the sense of self-respect. Personal independence is a tree of rare growth, and even under the most favorable circumstances for its development, is by no means too deeply rooted. Where one stands straight up and looks the world honestly in the face, a thousand

"Bend the supple hinges of the knee
That thrift may follow fawning."

To have no home—to live by courtesy, with the constant feeling that pleasing, not one's own conscience, but the will, and often the corrupt will, of another, is the condition by which one's place is held, not only destroys manliness, but strongly tends to sap the foundation of every other virtue.

Personal independence, if not in itself a virtue of the highest order, is a condition without which other virtues cannot flourish. The meanest thing that crawls is the slave of caste who dares only to think and speak as he is permitted. I would rather burrow in the caves of the earth than subordinate my convictions of duty to those whom accident has placed in superior physical circumstances. Accountable to God, and to Him only, the will of no man should be thrust between ourselves and duty. If this manliness of character can be asserted only at a sacrifice, the cost should teach us to prize it the more highly.

He who holds the title deeds to the land you cultivate, or for the house that shelters you, has no more rightful authority over your conscience than you have over his—has no rights, moral, social or political, which you do not possess. When he attempts to silence your voice or control your vote by other means than an appeal to your reason, treat him as an object beneath you—spurn him from your presence.

Our faculties are God-given, and it is better to go to bed with a hungry belly than with a dwarfed soul. Freedom of action is at once a duty and a privilege, and we have no right, if we would, to surrender it.

But dependence is not a necessity. With a home of only a few acres, one may be free; and with health and frugality an industrious family may, within a few years, buy themselves such a home. Not many acres, indeed, and a costly mansion, but yet a few acres and a humble cottage; and this their industry and taste may soon make a "sweet home."

To the family without a home, I would say, Defer not the day of your deliverance. The children are growing up without the endearments of home. They are forming habits in a state of dependence. You are depriving yourselves of the benefits of "a local habitation and a name."

If you are poor, be not ashamed of your poverty. Do not for a moment feel that you are of any the less consequence on this account, or that you are accountable to other than God for your actions. But save your earnings, curtail your expenses, and buy yourself a home, or the first spot of ground which iswithin your ability to purchase.

Then you may be free, and enjoy the rich moral blessings which a sense of personal independence brings. Plant the fruit-bearing tree and the vine; teach the flowers to cluster around your cottage, and make your few acres smile as a garden. Mingle your voices in songs and in hymns of praise to God. Long in the hearts of the children grown to manhood and womanhood be repeated the pleasant memories, and the old homestead be recurred to as "a thing of beauty, and a joy forever."

And the library—I conjure you not to forget the library. If not familiar with books, go to some reliable friend who is. The honest man whose home is the dwelling of industry, intelligence and virtue may look down on him whose acres are counted by the thousands.

GOVERNING CHILDREN.

BY BUSY BEE.

How hard it is to govern children—and, no doubt, much harder for some than others. It requires a great deal of thought and discipline upon my part to enable me to govern my children properly, and with all, I dare say, I often commit grievous blunders in regard to their management.

I think we should try to make our children love us. Of course, they naturally do; yet there are many little ways of endearing ourselves to them—of making their little lives happy, and the remembrance of their childhood a well-spring of joy all through life. Not, of course, by undue indulgence. That is, perhaps, as bad as undue severity. Nor by simply providing for their physical wants. This, truly, is much, but not all. The little things need more. They have their childish sorrows, which are as poignant to them as a grief to us. A loving word and caress should always be ready to soothe their little troubles and cure their little hurts. After they grow older and leave their home to make their way in the world, if the thought of home is one of fond remembrance, and the love of parents deep and true, it must be impossible for them to go far astray.

Every evening, in order to get the children to go to bed in a happy, contented frame of mind—and, in fact, to get them to go willingly when their bedtime comes—I devote a half hour or so to reading to them, which they enjoy very much, looking forward during the day to the evening's reading. It is very gratifying to give the good-night caress amid happy, contented feelings. We read and talk about the little stories and poems, and really I think I enjoy it as much as they. The Agriculturist furnishes us many an evening's entertainment.

HOW TO MAKE MISCHIEF.

BY MRS. L. W.

Keep your eye on your neighbors. Watch like a spider in its den for an opportunity to pounce upon them. Do not let them stir without watching, or they may do something wrong. To be sure, you may have never known them to do anything bad, but it may be on your own account they have not. Perhaps, if it had not been for your kind care, they would have disgraced themselves long ago. Therefore, do not relax any effort to keep them where they ought to be. Never mind your own business; that can take care of itself. If a man looks over the fence, be suspicious of him. Perhaps he contemplates stealing, one of these dark nights. There is no knowing what queer fancies may have got into his head. If you find symptoms of anyone passing out of the paths of duty, be particular to tell every one else what you see. Circulate such tidings, though it may not benefit yourself or anyone particularly. Do keep something a-going. Silence is a dreadful thing. It is said "there was silence in heaven for the space of half an hour." Don't let such a thing occur on earth. It would be too much for this mundane sphere.

If you wish to cultivate a gossiping, meddling, censorious spirit in your children, be sure when they come home home from church, from a visit, or any other place where you do not accompany them, to ply them with questions concerning what everybody wore, and how everybody looked, and what everybody said or did; and if you find out anything that you can censure, always do it in their hearing. You may rest assured, if you pursue a course of this kind, your dear children will not return to you unladen with intelligence. And rather than what they communicate to you should be uninteresting, they will, by degrees, learn to embellish in such a manner as shall not fail to call forth remarks and expressions of wonder from you. You will, by this course, render the spirit of curiosity, which is so early visible in children, and which, if rightly directed, may be an instrument of enriching and enlarging their minds, a vehicle of mischief which shall serve to narrow and vitiate them.

Home Power.—It is a common saying that "manners make the man;" and there is a second, that "mind makes the man;" but truer than either is a third, that "home makes the man"—for the home training includes not only manner and mind, but character. It is mainly in the home that the heart is opened, the habits are formed, the intellect is awakened, and character moulded for good or for evil.

For that source, be it pure or impure, issue the principles and maxims that govern society. Law itself is but the reflex of the homes. The tiniest bits of opinion sown in the minds of children in private life afterwards issue forth to the world and become its public opinion, for nations are gathered out of nurseries, and they who hold the leading strings of children may even exercise a greater power than those who yield the reins of government.

Growing Old.—How strange our ideas of growing old change as we get on in life! To the girl in her teens the riper maiden of twenty-five seems quite aged. Twenty-two thinks thirty-five an "old thing." Thirty-five dreads forty, but congratulates herself that there may still remain some ground to be possessed in the fifteen years before the half century shall be attained.

But fifty does not by any means give up the battle of life. It feels middle-aged and vigorous, and thinks old age is a long way in the future. Sixty renunciates those who have done great things at three score, and one doubts if Parr, when he was married at one hundred, had at all begun to feel himself an old man. It is the desire of life in us which makes us live so long.

One of the most attractive and valuable publications which reach our table is the California Agriculturist, published monthly at San Jose, at $1 50 per annum.—*Castroville Argus.*

Correspondence.

DEEP VS. SHALLOW CULTURE OF THE SOIL.

BY MECHANIC.

Mr. Editor: In your April number I noticed a letter from Castroville that is quite interesting, yet I respectfully differ with the writer in some of his views, but most heartily endorse his notions of rotation of crops, thorough pulverization of the soil, and, as a general rule, early seeding, especially in dry seasons. However, I would pulverize the soil very deep, and if it was not fertile, raise crops that would warrant manure to fertilize it. In shallow soils, with poor subsoils, the deepening should be gradual, and proceed only as fast as you are able to fertilize it. Some kind of well-fed stock—either hogs or cattle—to convert your corn, barley, peas and straw into manure, is essential to improve poor land. Lime added occasionally, as the manure enables the soil to bear it, will work astonishing results.

The manure, in your dry climate, should be compost, and thoroughly rotted; but manure from poor stock is next to worthless, and will not pay for hauling out, unless it is thoroughly decomposed, as it is liable (in a coarse state) to make the crop suffer with drouth.

"Subscriber" says he is convinced that thorough surface cultivation is best. So am I. But the deeper the better, if thoroughly and correctly done. It is better to cultivate shallow than to turn it up deep and late, and then seed upon the coarse clods. His unsatisfactory experiment of 1870–1 might have been of the latter class. Had the deep-plowed soil he mentions been thoroughly pulverized by summer-fallowing, with two or three plowings and harrowings, and seeded early, the result would probably have been reversed.

The most advanced farmers of England plow deep, and trench plow, and follow the second plow with the subsoil, which gives them the most satisfactory results. Of late years, some have used a heavy stationary steam engine, with wire ropes and pulleys arranged to draw the plows across the field. This mode enables them to till the ground still deeper than before, with better results.

"Subscriber" speaks of the success of farmers in Europe without very deep plowing, yet admits, in the same sentence, that it has paid them to deepen their shallow soil artificially, manure it, etc.; but he must also admit that such farmers come up to the high standard of the most advanced, scientific and practical farming practiced in England. He thinks me in error about my 14-inch plowing—or the amount of the crop, I know not which—but I can assure him there is no error. The old farm was thought to be worn out, but it really was only packed so tight for ten or twelve inches deep that the water and corn roots could not enter it, and in dry weather it cracked as deep, or deeper, than your adobe soils. My friends thought me foolish when I obtained the place, and were still more worried when I kept a man, with a good team, at work nearly all summer preparing sixteen acres for corn the next season; yet they changed their minds when they saw the biggest crop of corn, by nearly 30 bushels, that the Boise Brule bottom land ever produced. The driver's work, board and horse feed, to summer-fallow the land, cost me a trifle over $9 per acre. The

crop netted me, at my storehouse on the river bank, after paying freight to New Orleans and commission, $139 25 per acre, and the result confirms me in my old notion that "whatever is worth doing, is worth doing well."

I am aware that California, as well as our Oregon farmers, think that, owing to the high price of farm labor, they must expend as little work as possible, and "Subscriber" sounded the key-note to his argument when he spoke of the extra power required to plow deep; yet I still think that thorough farming will pay in either State. I would not advise rash or reckless experiment, but would say, Go slow until, by a series of small and careful experiments, you are sure you are right, and then go ahead.

I like the vim in "Subscriber's" letter, and would not give a fig for the contented individual, whether farmer or mechanic,—yet contentment is said to be the main source of happiness, and is supposed by many to be a rare Christian virtue. But give me the man who is always trying, judiciously, to soar to something better—the discontented, restless mind that is trying to make two spears of grass grow where but one grew before, and when he has made the discovery is willing to impart it to others—that's the man for me. He is worthy the honor due to a public benefactor. Yet we all should be cautious about too hasty conclusions from imperfect experiments.

I heard of a new importation from Ireland trying a feather bed by placing a feather upon a rock and reposing thereon. In the morning he condemned feather beds as very hard institutions.

I know of a professor in a medical college who had heard of using medicine hypodermically soon after the discovery was made, but knew not how to use it. Meeting with a case where an anodyne was indicated, the professor poured a quantity of sulphate of morphia into his hand, made a strong solution, and then, with his syringe, administered the dose. The patient went to sleep in spite of all efforts to keep him walking, and never awoke. The professor was loud in condemnation of this valuable discovery; but had he known that a quarter of a grain was a dose, and governed himself accordingly, the result would have beendifferent.

I do not give the latter illustrations to ridicule "Subscriber, but only as a caution against imperfect experiments and hasty conclusions.

Business is too pressing to allow me to write a lengthy argument, or the hundredth part of my observations on the universal success of deep and thorough culture, with rotation of crops, in the different States.

If "Subscriber" will continue his experiments nine, or eighteen years longer, he will have more experience from which to form mature conclusions, and may possibly change his mind.

Salem, Oregon, May, 1876.

California Agriculturist.—We are in receipt of the 4th and 5th numbers of the Cal. Agriculturist and Live Stock Journal, published at San Jose, California. The contents are of the ablest and most interesting character, and the typographical appearance is of the first order. The publication is an honor to San Jose, a credit to the State, and is excelled by but few in the country. The proprietors deserve a liberal patronage from the people of the coast, and we doubt not will receive it. We advise our agricultural readers to subscribe for the Agriculturist.—*Nevada Transcript, May 9.*

Domestic.

The Eater Eaten.

AN ORIENTAL COMIC KITCHEN SONG.

Once on a time, in Ispahan
There reigned a very remarkable man,
Who crammed every day in his gaping maw
A whole stuffed lamb, besides a pilau
Curiously made of peacocks' gizzards,
Scorpions, snails, and tails of lizards;
Oh! wasn't this a deal too bad
Of Rama Brama Amerazad?

He fried an elephant cut in steaks;
He potted two hundred black-ringed snakes;
He stewed a zebra, boiled a boar—
Liked the last, and polished off four;
Scalloped a sea-cow, fried a whale,
Framed a dish from a tiger's tail,
Oh! wasn't this a deal too bad
Of Rama Brama Amerazad?

A regular shark at calves and cows,
He cleared the meadow and gutted the house;
All the week ate fowls in flocks,
Till the farmers tore their hair in shocks.
Ispahan was filled with sheep
Night and day, till never a sleep
The people got—a deal too bad
Of Rama Brama Amerazad!

It was getting serious. Rama now
Looked on men with a thoughtful brow.
If a fat pasha came to dine,
He eyed him gloomily over his wine.
He pinched fat children. Worse and worse,
He even pinched the family nurse!
He'd soon turn cannibal—oh! the bad,
Naughty Rama Amerazad!

At last the rabble grew red-hot mad,
So rapidly Rama went to the bad;
They stormed the palace and killed the k ng—
In a pot he soon was simmering;
They baked him then in a mighty pie;
And didn't they gobble him—oh, my eye!
A very good end for one so bad
As Rama Brama Amerazad.

FAMILIAR TALKS---No. II.

BY SNIP.

I CONGRATULATE you, friend Herring, upon your success with moss and ferns. My experience has been just the opposite. The moss won't stay green, and the ferns do anything but grow and keep fresh. A poor little insignificant-looking leaf comes up, and when it is about an inch high it dies and another comes. What do you suppose is the reason?*

BLIGHT ON ROSE BUSHES.

What shall I do with my rose bushes? They grow well, but the leaves are covered with what seems to be a white mould. Many of the buds do not come to maturity, and there has not been a perfect flower on them since they were set out, more than three years ago. Other roses are growing here that are perfectly healthy.

"A FASHIONABLE WOMAN'S LAMENT"

awoke—well, hardly a sympathetic chord, for I spent to-day three hours ironing a dress (I dare not tell how long I was making it), and when I finished, aching hands, throbbing head and tired feet forced me to resolve that never again would I make a dress "in the fashion," and spend so much time and energy all for—what? I do not know how some women can do so much of such work and do necessary work too. To the majority of women the sewing machine is no help whatever.

CLEANING TIN.

"How bright your boiler looks," said some one to me not long ago, referring to the water boiler that I use instead of a tea-kettle. I had forgotten to wash it in the morning, and just rubbed it off with a dry cloth. I was surprised myself, but since then I have done no scouring on tinware, unless it is burned. I use a cotton cloth, but am not sure but woolen would be better.

*See remarks under City Gardening Department.

DOUGHNUTS.

I have been looking in vain for the receipt for those doughnuts that "Mary Mountain" praised so highly. Why did she not send it for the benefit of the readers of the Agriculturist? Here are two that I think are good. First: one half cup of buttermilk or sour milk, the same of cream and sugar, two eggs, one teaspoonful of soda, salt and spice. Second: one and a half cups of sugar, two tablespoonfulls of butter, too eggs, one quart of flour, three teaspoonfuls of yeast powder, milk enough to roll out without any more flour.

COOKIES.

One cup of sour cream, one cup of sugar, half a teaspoonful of soda, flavor to suit.

CONTRIBUTED RECIPES.

Original, or Such as Have Been Proved Good by Trial.

APPLE CAKE.

Chop rather fine three cups of dried apples and soak over night in two cups of molasses; stew for half an hour; when cold add one cup brown sugar, one cup butter, three eggs, three cups flour, one cup raisins, two teaspoonfuls allspice, two teaspoonfuls cinnamon, one and a half teaspoonfuls cloves, one nutmeg, one teaspoonful of soda, and two of cream of tartar. Citron and currants may be added.

COCOANUT CAKES.

Remove the rind from a cocoanut and grate it; add one pound of white sugar and the white of one egg whipped to a stiff froth; mix with the hands as quickly as possible, and make into small cakes the size of a large walnut and bake on buttered paper placed upon a buttered tin.

COCOANUT CRACKERS.

To one pint of oatmeal add one gill of fresh cocoanut or two-thirds of a gill of desiccated cocoanut, and one gill and two tablespoonfuls of water; roll into one eighth of an inch thick; cut into fancy shapes with cake-cutters, and bake in a very slow oven, so that the will dry out rather than bake.

TAIOCA AND PEACH PUDDING.

To one cup of tapioca add three and a half cups of boiling water, and let it stand half an hour. Mix with it one and a half pints of sliced canned peaches sweetened to taste; ornament the top with fanciful designs in blanched almonds and raisins; bake three-quarters of an hour in a white nappy, covering the top with paper to prevent scorching. Serve cold in the same dish.

JELLIED GRAPE.

Cook one half pint of rice half an hour in three half pints of water; strain three pints of cooked Isabella or Concord grapes; add them to the rice; cook another half hour; sweeten to taste, and serve cold in a glass dish.

COCOANUT BREAD.

To three half pints of Graham flour and three tablespoonfuls of cocoanut, add half a pint of cold water; when well mixed, knead on a board until little flour is left on the board, say fifteen minutes; make into rolls two inches thick and eight long; bake from thirty to forty minutes in a moderate oven; when quite cold, cut and serve in thin slices.

FRUIT BREAD.

Make as above; roll out to the size of a dinner plate and half an inch thick, cover with stoned-dates, blanched raisins and chopped figs, then roll upon itself, fasten the ends, bake one hour, cut into slices when cold.

TO CLEAN GARMENTS.

Wet a sponge in warm water, and squeeze it out till dry; then sponge one place after another until all the garment has been cleansed. All the dust and soil will be absorbed by the sponge. But if the garment is very much soiled, wash the sponge in clean water several times, squeezsng it as dry as possible by wrapping it in a piece of black alpaca. This method of cleansing is more effectual than a hand-brush, and many spots will disappear by the use of pure water.

FISH CHOWDER.

Slice ten potatoes and three onions, the latter very thin; cut four thin slices of pork and fry brown, then lay them in the bottom of the kettle, covering them with a layer of any fresh fish cut in slices; pepper and salt; add a layer of the potatoes and onions, which should be previously well soaked in cold water; now add another layer of the fish, salt and pepper as before, covering this time with a layer of pounded or broken soda-crackers; add another layer of the vegetables, cover with crackers, let it boil briskly a half-hour; add a cup of rich milk and dish.

RHUBARB PIE.

Take off the thin skin, cut the stalks in small pieces, add a little flour, and place it between two covers. When the paste is done remove the top crust and add sugar and butter, mixing them thoroughly with the rhubarb. Put the top crust on again and serve warm. Other seasoning may be added if desired. Rhubarb pies made in this way do not run over and waste their sweetness in the oven,

BORAX FOR WASHING.

The use of borax in Europe for washing is well known, the addition of a large handful of borax, instead of soda, to ten gallons of water being sufficient to save half the quantity of soap ordinarily required. For light fabrics and cambrics a moderate quantity is to be used; but for articles which require to be made stiff a strengthened solution is necessary. Being a neutral salt, it does not affect the texture of linen in the slightest degree; and as it softens the hardest water, it is much used in washing generally.

GINGER PUDDING.

Two eggs, one-half cup of sugar, one-half cup water, one-half cup milk, three teaspoons yeast powder in two cups flour, butter the size of a hen's egg, two teaspoons of ginger. Steam in a covered pudding-dish two hours. to be eaten hot with sauce.

CLAM CHOWDER.

One quart-can of clams, one quart-bowl of raw potatoes pared and cut in slices, one quart-bowl filled with sliced onions, a slice of sweet salt pork as large as your hand cut in strips and fried to a crisp, butter the size of an egg, salt and pepper to taste, three pints of boiling water. Draw off the liquor from the clams and mix it with the above, and in fifteen or twenty minutes add the clams, some crackers or toasted bread, and boil up once and serve.

"Press On."

Press on! You're rusting while you stand;
Inaction will not do:
Take life'f small bundle in your hand,
And budge it briskly through.

Jump over all the "ifs" and "buts;"
There's always some kind hand
To hit life's wagon o'er the ruts,
And poke away the sand.

Boys and Girls.

Trust.

Searching for strawberries ready to eat,
Finding them fragrant and large and sweet,
What do you think I found at my feet,
Deep in the green hill side?
Four young sparrows, the cunning things,
Feathered on back and breast and wings,
Opening their four mouths wide.

Stooping lower to watch my prize,
Watching their motions with eager eyes,
Dropping my berries with glad surprise,
A plaintive sound I heard;
And looking up at the mournful call,
I spied on a branch, near the old stone wall,
The poor little mother bird.

With grief and terror her heart was wrung,
And while to the slender boughs she hung,
She felt that the lives of her birdlings hung,
On a still more slender thread.
"Ah, birdie," I said, "if you only knew
That my heart was tender and warm and true!"
But the thought that I loved her birdlings too
Never entered her small round head.

And so through this world of ours we go,
Bearing our burdens of needless woe,
Many a heart beating heavy and slow
Under its load of care;
But oh! if we only, only knew
That God was tender and warm and true,
And that He loved us through and through,
Our hearts would be lighter than air.

Dot Lambs Mary Haf Got.

Mary haf got a leetle lambs already;
Dose vool vos vite like shnow;
Und efery times dot Mary did vend oud
Dot lambs vent also oud, mit Mary.

Dot lambs dit follow Mary von day of der shchool house,
Also, vich it dit caused dose schillen to schmile oud loud,
Ven dey dit saw dose lambs on der inside of der shschool house.

Und zo dot shchoolmaster dit kick der lambs gwick oud;
Likewise dot lambs dit loat around on der outsoides,
Und dit shoo der flies mit his tail off patiently aloud.

Undil Mary dit come also from dot shchool house ond.

Un den dot lambs din run right avay gwick to Mary,
Und dit make his bet on Mary's arms,
Like he would said, "I doud was scared,
Mary would kept me from all dhroubles enabow."

"Vot vos der reason aboud it, of dot lambs und Mary?"
Dose schillen dit ask it, of dot shchoolmaster;
"Vell, dond you know it, dot Mary lofe dose lambs already?"
Dot shchoolmaster dit said.

"OUR CORNER."

AUNT POLLY is happy to greet her dear nieces and nephews again. Isn't June a real sweet month? May was ushered in with blooming roses and has gone out in fragrance. June, with a brighter sun, and just as many sweet and beautiful flowers, shows also the promise of fruits. Look at the little baby apples and pears hanging among the leaves that almost hide them. The peaches, too, are the color of the leaves, but in another month or two they will begin to show some signs of ripeness. The cherries! Oh, the luscious cherries that little children and birds love so much, are now full ripe, and Oh! so refreshing to eat, and so pretty to look at as they hang down on their long stems. Out in the fields the grass has grown to its full size, and the men are mowing and making the fragrant hay. See the wheat and barley and oats, with full-grown heads, waving in the wind and reflecting the sun so prettily! The hills are turning brown with many colored flowers, and soon will fade to a dry look for the want of rains. So with summer comes beauty; and as ripeness grows the color of wild flowers and green grass fades to a russet brown. Then the fruits of the earth and the grains that feed us all mature, and man and beast and bird eat of the good things and praise the Giver of all good for the blessings that are provided for all of God's creatures.

And now Aunt Polly wants you to read this nice little story that she has selected for you all:

A TALK WITH BERTIE ABOUT THE GRAIN.

"I guess crackers don't grow, do they, auntie?" said Bertie, as he took one in his little chubby hand for his lunch.

"No; the man makes them and puts them in the oven and bakes them as Mary Ann bakes her bread."

"What does the man make them of?"

"He makes them of wheat. Here is some wheat. This grows in a field on a stalk as high as your head, all wrapped in little husks at the top of the stalk. When it is ripe the man cuts down the stalks and shells out the wheat with a big threshing machine, and then it looks like this. After that it is taken to the mill and ground very fine. Wait, and I will grind some for you in the coffee-mill; there it is ground up finer than that, and then the baker makes it into crackers and bakes them."

"Well, the stuff they make the crackers of grows, then, doesn't it?"

"O, yes. I told you the other day that all our food grows out of the ground in some way. There is a great deal of this wheat grown, and when it is ground into flour it is made into bread and cake and puddings, and many other things that we eat. There are also other kinds of grain that we raise and use in the same way."

Bertie ate a little while in silence, looking now at the crackers, and now at the wheat. At last he said: "Well, auntie, they can't make any bad drink out of this, can they? Because, you see, it is all hard and dry."

"Yes, Bertie, it is hard and dry, but they wet it and soak it up, and I am sorry to say they do make a great deal of bad drink out of some kinds of grain."

"What kinds of grain?"

"Rye, for one, and corn and barley and even of wheat."

"What is rye, auntie?"

"Well, it looks a good deal like wheat, only it is not so large."

"Is it good to eat?"

"Yes; we make it up with cornmeal into rye and Indian bread, and some people make it into bread by itself. Then it is good for food; but when it is fermented and spoiled for food, it makes a very bad drink."

"Oh, yes; now I remember; that was in the little verse you taught me a long while ago,

> "I was made to be eaten,
> And not to be drank;
> To be ground in a mill,
> And not soaked in tank."

"I am glad you remember it. You may say it all if you can."

So he repeated it all very prettily, and then he went off to play in his little garden.

After a while he came back to me with a very serious face and said: "Auntie, what would it do to meif I should drink the cracker?"

"What do you mean, Birtie?"

"Why, when I was sick mamma put a cracker into a cup with some hot water and sugar and milk, and when it was soft I ate it, and then I drank up the water, and some of the cracker, too."

"Well, it didn't hurt you, did it?"

"No, I guess not; but why didn't it if I drank it instead of eating it?"

"Because you did not let it stand and rot; that's what makes the difference. When they make it into a bad drink, they let it sprout, and that makes it sweetish; and then they grind it or mash it, and soak the sweetness all out into the water; and then they let it stand and rot, and that is what spoils it. You wouldn't eat your soaked cracker if it should stand till it was sour and spoiled, would you? Don't you know how quickly mamma sent away from the table the stewed berries that were sour?"

"Oh, yes; and I remember the old lady at the hotel last summer who went away from the house because the cold beans that she sent for were sour."

"So you see people do not think of eacing rotten things, and why should they drink them? It is the rotting that makes them poisonous. That is the way in which the poison alcohol gets into them."

"And is there alcohol in everything that is rotten?"

"No; only those things that have sugar in them. It is the rotting of the sugar that makes the alcohol. Rye whisky has a great deal of alcohol in it."

"Whisky! Oh, yes, that is what papa called it. We saw a man on the street one day who acted very bad, and papa said that he had been drinking whisky. I wonder what made him drink it?"—*Aunt Julia, in Youths' Temperance Banner.*

OUR BUDGET OF LETTERS.

Here are three nice little letters that I regret came to me too late to appear in May. Never mind, dears, if you did not beat on the word "carpets." We have got some more chromos left and will give you a chance every month. I want you to write often as you can. You have done well any way, which is a credit mark to you. We will let Mary speak first:

LIVERMORE, April, 1876.

Dear Aunt Polly: I have tried again to see how many more words I could make out of "carpets." I succeeded in getting 169, which I send you. The answer to Jennie's rebus is the letter M. It is splendid fun, I think, to make out words. I hope you will give us something to puzzle our minds every month.

Your little niece, MARY C.

That is just what Aunt Polly intends to do, Mary, and she hopes you will get the chromos yet. The first list was mislaid, so that Aunt Polly doesn't know whether this new list contains the same words as the first one. If you have sent 334 different words, send you full name for the chromos.

Now hear what our little Tillie says:

MILPITAS, April, 1876.

Dear Aunt Polly: I look for the AGRICULTURIST every month with as much interest as the best farmer in the State, not that I read all about horses and cows, but I do love to read the letters your nieces and nephews write to you. I have tried how many words I could make by using the letters in "carpets," and how well I have succeeded—174 words—you must judge for yourself. I will write to you often if you will let me, and sometimes I might have a puzzle to send.

TILLIE.

We are looking for your puzzle, Tillie. Send it along.

And now who that reads Jennie's letter will say she is not smart? She came within one of earning the pair of chromos, and considering that a boy got them, and Jennie sent the largest list of any girl, I shall send her a pair of chromos, too. Isn't that right? Aunt Polly thinks so.

LIVERMORE, April, 1876.

Aunt Polly: I am sorry I did not get to write sooner and send the answers to the puzzles, but I have been away from home and could not. I hope I am not too late for a chance to get the pictures; but I have not the least hopes of getting them, for there are so many words can be formed from the letters in the word "carpets." I think the answer to Willie's enigma is Washington Irving, and to Tommy's, CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL. [Right.]

Hoping I have not sent these in too late, I will close, and remain,

Your niece, JENNIE D.

P. S.—I have succeeded in getting 313 words from "carpets." J. D.

Send your full name, Jennie, and get the chromos.

Here comes a letter from little Georgie Jewell, who is only 7 years old, written by herself without any help from anybody:

SAN JOSE, May, 1876.

Aunt Polly: I have a new little brother. He is so cunning. He was born the day after the opening of the Centennial Exhibition. We have moved on Ninth street. We had a little dog at first, and then we had a little kitten. We made a garden and thought the dog would dig the garden up and break the flowers off, and so we gave him away. The kitten was given to us just when we gave the dog away. The kitten would cry all the time, and so we gave it away as we did the dog; and when we gave the kitten away we had a baby. We have got some little chickens, too. And that is the way we go along now. So good-by. I can't stop to write any more to-day; I must go and change my dress now to go out.

Yours, truly, GEORGIE JEWELL.

Aunt Polly hopes, Georgie, that you will help mamma with the baby all you can, and tell us next time all what you do every day to help her.

Here is the letter that Walter Rose promised a long time ago. Better late than never, Walter; but best never late:

SPRING LAKE, May, 1876.

Dear Aunt Polly: My sister, Willa, thinks I am too little a boy to write you, but I know I can if she can. If she is bigger and older than I am, she needn't think that, because she is a girl, she can do what a boy can't. I'll just show her. If I do make mistakes, and don't write the best of letters now. That is nothing. I am not always going to be a little boy, I reckon.

She did not tell you that we used to live away off in Southern Arkansas, right close to where lots of wild Indians lived. We used to be dreadfully afraid of them sometimes.

Sometime, Aunt Polly, I will tell you about my big Newfoundland dog, Dick, a splendid great bow of a dog, who loved Willa and me so much; how two big Kansas rattlesnakes bit him once; how somebody at Wichita, Kansas, stole him; then how papa lost him at last. Then about our little Kansas kitten that Auntie Lottie killed and then brought to life with mamma's machine oil can, sweet oil and cream, and about mine and Willa's two little bossy cows, and little pig that auntie gave us; and—oh! ever so many things more, Aunt Polly, if you think you can spend time to read the letters of a little boy like me. Don't expect the editor of that paper (I forget what its name is) will print them, but I don't care; maybe some day, when I am bigger and have gone to school lots, he will like my letters for his paper.

Oh! I forgot. Santa Claus didn't have very much for sister and me this year, because, you see, Aunt Polly, there were ever so many very poor little boys and girls in this place, and he hadn't

money enough to get all of us as much as we would like to have. But papa and mamma says times will be better after a while, and then the children will all fare better. But we had lots of fun anyhow with our presents, and ever so many nice things mamma cooked for us to eat. I expect there is lots of terribly poor children everywhere who had no good things to eat or nice things at all. I am real sorry, Aunt Polly, aren't you? My name name is WALTER ROSE.

Aunt Polly thinks that the girl who writes the following letter is a pretty large one, but she is just as welcome as long as she has a good word for all of us and thinks so much of the AGRICULTURIST. The editor never objects to having a good word spoken for the paper. Editors are so much like proud girls—they like flattery. I wonder if our editor ever reads his own paper, and if he will see that Aunt Polly has dared to talk so about him. But listen to Kitty Hart:

SALINAS, May, 1876.

Dear Aunt Polly: There are lots of people here who take the AGRICULTURIST, and I hear what some of them say about it which you might like to know. My aunt Jane says she wants me to bring her the February number of the AGRICULTURIST, for there she saw a receipt for making cream cake which Mattie Sargent tried one day and gave her some to taste. She wishes her folks took the paper, and she hopes they will some time, for Mattie says she's tried a good many receipts from it and finds them good. A boy I know says he always reads the funny things in Aunt Polly's "Corner," and wishes there were more. He would write to her himself if he knew anything good enough. Our hired man says to me, "Kitty, fetch the agricultural paper and see what it says about feeding calves. We've got one whose mother died afore it was big enough to drink." Mother says she could not keep house without the AGRICULTURIST no how; 'cause why, she finds so many useful things there; and then it rests her to read about what "Jewell" writes on health, and the rest of the ladies about other things. Jim likes the poetry best, and learns pieces to speak at school. I learned one once, and I heard a lady read one poem from it at a church social. Sister Annie likes the gardening part, and says she is so glad she knows how to fix hanging baskets, she wants one in our best parlor. Farmer Brown, who lives near us, was talking to store-keeper Brown on the church steps, last Sunday, and he say, "Did you see Dr. Scott's article in the May number of the AGRICULTURIST? It is worth reading. Fact is, that paper, every month, contains articles worth more than the whole year's subscription." My aunt Hatty came along just then, and says she, "Yes, and the cutest part on't is, that it is temperance clear through. If you know anybody around here who don't take it, for goodness' sakes lend 'em a copy." Now I've told you enough; I was only going to write a few words to send with two subscriptions I collected for you. Inclosed you will find the names, and the money I'll send next time, when I get more. Yours, truly, KITTY HART.

Aunt Polly thanks the Lompoc *Record* for noticing one of her nephews. Charley Tucker must be a good boy to merit such words. This is what the paper says:

"Among the correspondents of the AGRICULTURIST, we notice the name of Charley Tucker, who is also the author of a word puzzle. Good for Charley! Reading, writing and thinking make a useful and well-posted man."

A MISCHIEVOUS PET.

Thinking an item from this locality would be of interest, I add a few lines. This part of Shasta county is a very poor tract of country—no orchards, flowers, or anything calculated to make life endurable.

Mr. Lendrum, on his way to Oregon with Angora goats, passed through here, and left a Kid of that breed with Mr. Warner, on Pit river. It is one of the most mischievous animals I ever saw. An out-door cupboard is a favorable climbing place for him, overturning jars of yeast, scattering seeds, and other petty mischief. One day, while Mrs. W. went out of the house for a short time, leaving the door open, Captain Kid must needs walk in and pull out a pan of bread from the oven, and devour half of it before she returned. He was fully impressed with the idea that he had a right to all the edibles he could get hold of. He helped himself liberally to strawberry vines, the best potatoes, and, I firmly believe, made away with some horseradish that we were trying to start. He seemed to have a discriminating taste, for he ate holes into the mellowest squashes, and corn fodder laid away for the cow had special attractions, together with the grain and hay, to and from which he had more exits and entrances than the squirrels. Seeing the board fence did not prevent him from going over, we laid boards on top, but he had three or four passages soon made underneath. He thought more of taking his naps on the nice, clean beds than on the cold, cold ground, at least when no one was around to tend to him. He kept Mrs. W. in a lively state of terror walking all over the braces on the bridge, for fear he would tumble in and get drowned. Taking it altogether, we want to know if there is anything (a mule excepted) with a sublimer cheek than an Angora goat.

Your journal is a most excellent one, and we would not do without it. Your outside cover cannot be beat for beauty, and as an example of woman's work is a powerful argument. Yours, truly,

T. J. PILKINGTON.

Burgottville, May, 1876.

GRANDMA'S TALKS.

Easy Lessons from Nature--No. 5.

Good morning, children! So you have been having a gay time in the garden and woods this morning. How do I know it? Why, you have brought both into the room with you. Don't you believe me, Johnny? How else should I know where you have been? Yes, indeed, you bring with you the perfume of violets from the garden, bay leaves from the woods, and paint from the brook-side. See, then, how many outside "atoms" you have unconsciously brought to me.

You want me to show you one single atom all by itself, do you, Lucy? Well, let us try to do that.

Here I have a microscope to help our eyes to see smaller things than we can with the "naked eye" (as we call using the eye without the help of magnifying glasses).

Here are two things which look very much alike: this finest of cambric needles and the sting of a bee. But compare them under the microscope. The needle looks rough and coarse, almost like a crowbar, and it seems to have lost its point; but the sting of the bee is as smooth and perfect to its sharp tip although magnified as much as the needle. Do you think you can see the tiny atom on the very end of that point, Lucy?

Here is a lump of sugar. You may pound it to powder in this little mortar, Johnny. Now we will place a few grains of this powder under the microscope. How coarse it looks! Don't you think, if we had the means, we could grind it up finer than that? Those are not atoms yet, because atoms are such very, very small particles of matter that they cannot possibly be divided into two parts, and the smallest particle of sugar must contain an atom of each of the several substances which combine to make sugar.

Now I will dip this needle into this glass of liquid which looks like water. Touch your tongue to the needle, Johnny, and tell me what it is. How do you know it is lemonade? Oh! you can taste the lemon and sugar, can you? Then imagine, if you can, how small the atoms are in that tiny drop of lemonade to give enough of the water, lemon and sugar (each composed of various substances) for you to taste distinctly.

I will now rub some of this bright red paint, which we call carmine, upon this saucer. Now I will mix it with the water in this large pitcher. Do you see what a pretty color it has all become? The particles of carmine have separated and mingled with the water, and see how minute they must be to color nearly a gallon of water.

If you keep only one violet in a room, it will throw off particles of perfume for days, and yet not grow smaller in size. So it is with musk, which has a strong perfume. I have read that one grain of musk will sent a room ten years and weigh as much as at first. Of course, particles of the musk are constantly leaving the grain, but we cannot measure the loss.

Thus you perceive that the very smallest particle of matter that you can see or taste or smell is made up of millions of smaller ones which are composed of atoms of *simple* substances (these are substances which contain only one kiud of matter). Do you think, Lucy, that your eyes have the power to see one single atom all by itself? No, indeed, we cannot even imagine the smallness of an atom, neither can we really know the capacity of matter for being divided and sub-divided. This property, belonging to all matter, is called *Divisibility*. You can remember that word easily, children, because every alternate letter in it, except the last one, is an *i*.

You are very much interested in that microscope, children, and well you may be. There is really no end to the wonderful facts to be learned by the use of a microscope. When I was a little girl, I remember seeing a drop of water magnified by means of a solar microscope. The drop of water looked as large around as that centre table, and it was alive with creatures, some very small and some like monsters gobbling up everything that came in their way. Now in that drop of water the naked eye could see no living thing, but by the aid of the microscope what curious and astonishing creatures appeared, swimming as freely in that one drop as fishes do in the ocean.

You ask, Johnny, if all the water we drink is just like that, full of such fighting and gobbling creatures. It is probable that all water contains living creatures, though I have been told that the microscope does not detect such quantities in fresh water fit for drinking; stagnant water, which is poisonous to us, contains the kind of creatures that I saw.

But only think, children, how small the atoms must be in those lively little bodies! Think, too, of the infinite Wisdom which can plan and perfect such wonders!

FOR THE "CORNER."

FROM M. E. T.

I am going to tell you a story about the same little Willie with whom I made that contract. You may not see anything very funny in it, but I am sure you papa and mamma will laugh when they hear you read it.

Willie was very fond of reading, and would stay in doors for hours quietly reading his favorite book, the New Testament. Now, Willie was a poor reader, and a poor speller, too, for a boy eight years old. It happened about this time that a great political contention was going on, and the words "Democrat" and "Republican" were heard almost every day; besides Willie's infant mind had been fed on troubles arising from the spirit of partyism, and which had had the effect of stamping upon his memory the importance of a party name. One day, after reading, he sat apparently meditating upon the sacred pages before him, when suddenly a sober face was raised and a solemn voice said, "Mamma, was Jesus a Democrat?" Mamma was both amused and astonished at so odd a question, but when she saw the earnest look upon his face she said, "Why do you ask?" "Because I have read where Jesus ate with *Republicans* and sinners, and I thought perhaps he might have been a Democrat."

THE PUZZLE CORNER.

The boy or girl that will send Aunt Polly the best original puzzle shall have three chromos; the one who will send the second best puzzle shall have a pair of chromos, and the one who will send the third best shall have one chromo. Now, nephews and nieces, we want some original puzzles that it will be worth chromos to find out, and we want you all to see what nice puzzles you can make to try each other's skill.

Typical Trees.

For gouty people—the ache corn.
For antiquarians—the date,
For school boys—the birch.
For Irishmen—the ochl
For conjurers—the palm.
For negroes—See dah!
For young ladies—the man go.
For farmers—the plantin'.
For dandies—the spruce.
For actors—the pop'lar.
For physicians—syc a more.
For you wife—her will oh.
For lovers—the sigh press.
For the disconsolate—the pine.
For sewing machine people—the hemlock.
For boarding house keepers—'ash.
Always on hand—the pawpaw.
Who is this written for—yew.

A Very Singular Sentence.

"Sator arepo tenet opera rotas."

1. This spells bakward and forward all the same.

2. Then taking all the first letters of each word spells the first word.

3. Then all the second letters of each word spells the second word.

4. Then all the third, and so through the fourth and fifth.

5. Then commencing with the last letter of each word spells the last word.

6. Then the next to the last of each word, and so on through.

Read the new advertisements on second page of cover.

Beneath the hair, there is developed, in the autumn, *a short and exceedingly fine wool*, from which the famous Cashmere shawls are fabricated."

These descriptions prove conclusively (as I have elsewhere publicly claimed, without being disputed) that the Angora and the Cashmere are distinct and very different breeds of goats, especially in the important particular of their fleece.

The major portion of the world's production of mohair or Angora goat's fleece comes from Asia Minor. The imports into England alone now reach nearly seven million pounds annually. Considerable quantities are also produced at the Cape of Good Hope, and in Australia, while in our own country, California is beginning to compete with foreign producers. The Angora goat was first introduced to the Pacific Coast, in 1861, by W. M. Landrum, who took across the plains some bucks of the Davis-Peters stock.

The value of mohair, of a fair merchantable quality, — discarding fictitious, inflated prices and coming down to "hard pan"—is now from 60c. to $1 20 per pound in England and the United States. Quotations in Liverpool, 77 to 78c., and 93 to 94c., gold, the last sum equivalent to $1 20 gold, it this country, after adding duties and expenses.

Angora goats, mixed and pure, bring about the following prices in California: Ewes — half-breed, $4; three-quarter breed, $6; seven-eighth, $9; finer grades, $30; thoroughbreds, from $120 to $175 per head. Bucks—mixed, about $30; first-class thoroughbreds, from $150 to $200 each.

From these facts, it will be seen that this pursuit, though still in its infancy, has profit enough in it to give it a great outcome. The place to raise these goats, however, is not on the small farms of the Eastern and Middle States, nor in gentlemen's parks, gardens or lawns—for they will go "through and through" the waste lands and the wide ranges of the Pacific States and Territories, where the climate, herbage and other conditions are most favorable.

One point particularly to be noticed in these animals, is that they feed on herbage that sheep will not eat, and clean up the land for sheep. This makes them especially desirable as adjuncts to the sheep-raiser. In California, they say, in a flock of 1,000 sheep, kept by the same shipper, 500 goats additional can be easily managed without taking from the food of the sheep, the goat eating the weeds and briars, and leaving the grass for the sheep.

THE CALIFORNIA AGRICULTURIST, a magazine devoted to the interests of the farmer, published at San Jose, is upon our table. It is replete with valuable information for the class of readers for which it is intended, and serves its purpose better than any periodical ever published on this coast. It has long since become an exploded idea that book farming is not successful, and agricultural papers are rapidly coming into prominence. Indeed, why not? Agriculture is essentially the leading industry of the land, and there can certainly be nothing more important in developing these interests than an able exponent. As such we recommend the CALIFORNIA AGRICULTURIST, published at San Jose.—*Solano Republican, May* 11.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

ONLY 25 CENTS.

Comfortable Combination Clothing.

THIS STYLE OF UNDERCLOTHING FOR Ladies has been found by all who have used it, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

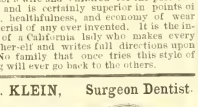
Patterns can be had by applying to **Mrs. Herring**, east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen,) or by addressing

C. C. C. Company,
Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. It is the invention of a California lady who makes every pattern her-elf and writes full directions upon each. No family that once tries this style of clothing will ever go back to the others.

Dr. N. KLEIN, Surgeon Dentist.

Room next to Wright's Photographic Gallery, Santa Clara St.



☞ The National Gold Medal was awarded to Bradely & Bulofson for the best Photographs in the United States, and the Vienna medal for the best in the world.

THE CHAMPION

FRUIT DRYER!

THE FAMERS' UNION

SAN JOSE,

Has taken the Agency of this Dryer, believing it to be the

Best, Cheapest, and Most Economical Dryer Made.

Experienced Persons in Fruit-Drying Recommend It.

Drying Fruit and Vegetables has become one of the departments of labor and profit among the industries of California, and we invite Fruit Growers to come and see our Champion Fruit Dryer, and test it with any kind of fruit or vegetables before purchasing.

This Dryer consists of a sheet iron furnace, from five to eight feet long, and two feet high, with a partition running horizontally six inches below the top, on the inside, the full length and breadth of the furnace, except a space of five inches at the back end. Beneath this partition the fire is kept, the heat of which passes to the back, and there turns a flange upward through the five inch space, and passes between the partition and top, back to the front end of the furnace and out of a chimney above the chest of drawers.

This arrangement completely equalizes the heat at each end and all along the top of the furnace, so that no one drawer is at any time hotter than the others.

The attachment to hold the fruit for drying, consists of a tier chest of drawers made wide enough to set out on each side and end about 15 inches from the furnace, and it is inclosed with tongued and grooved lumber, except space in front for the furnace and on each side for the drawers to pass in above the furnace. This chest is lined two feet high on the inside with sheet iron, and two inches from the drawers in from each side, supported by pieces passing from one side across the top of, and one foot above the furnace to uprights on the other, and meet in the center over the furnace. The bottoms of these drawers are made of wire cloth, on which the fruit is laid for drying. Over the center of each tier of drawers is a hole four inches square in the top, with a slide to keep it open or closed as the case may require, and through these openings the hot air passes in a continuous current from the furnace below. The space in front not filled by the furnace, is closed by a piece of sheet iron fitted over and down on each side, and to this piece there are two ventilators at the side of the furnace where the fire is hottest, to admit air. These two are the only places where air enters, and it is made very hot by the heat of the furnace, as it enters and passes rapidly up through the fruit in the drawers, and out at the ventilators at the top. This arrangement keeps a constant current of hot air passing through each drawer, which keeps it in the most rapidly drying process.

The chest of drawers is from four feet high to as high as desired. The drawers occupy about 4 inches space in the hight of the chest, and are about two feet deep, and 34 inches wide, and hold 25 pounds of fruit. But fruit will dry faster by putting in 12 pounds, and as it dries out a little, double it up. The machine can be built to have from 12 to 108 drawers, and will dry from 1000 pounds to five tons per day, of green fruit. Will dry any kind of fruit or vegetables in from one and a half to eight hours.

A San Jose Invention.

THE TUTTLE PUMP

Inventors have often racked their brains to get up a practical Pump that will raise a column of water in a continuous stream without jerk or jar, causing great strain upon the machinery and also unnecessary loss of friction. This difficulty has finally been overcome by Mr. H. H. TUTTLE, of San Jose, in a very simple and efficacious manner. His invention consists of a combination of Three Plungers (instead of one), working from a crank shaft in such a manner that one of them is always lifting or forcing the column of water. On trial it is found to work admirably, and will do more work with the same power than any other Pump, and the motion is always steady and smooth.

Watters & Biggs, of San Jose, are manufacturing these Pumps, and they are for sale at the Excelsior Marble Works. The pump-case is of galvanized iron, incased in wood. The valves are so constructed as to work with best effect. These Pumps can be constructed of any capacity to order, are suited to hand use, wind-mill, horse-power or steam power; are cheap, strong, and must be durable. The model of 2 8-inch stroke only, the size of a water pail, raised 60 gallons of water per minute.

Capt. Joseph Aram, of San Jose, has one, and pronounces it perfect. Persons interested are invited to call at the Excelsior Marble Works, Second street, and examine these Pumps, or address,

H. H. TUTTLE, San Jose.

THINNING OUT GROWING FRUITS.

Our best orchardists pay a great deal of attention to thinning out where too much fruit sets upon the trees to all grow to perfect size. On an average, at least one half of the fruit is taken from the trees when about the size of hickory nuts, and frequently two-thirds to three-fourths of it is picked off where the tree is crowded with fruit. There are two good reasons for this: one to prevent the limbs from breaking under the load of ripening fruit, and another to insure the large size of the fruit that is left upon the tree, together with superior eating qualities. The size and beauty of fruit has a good deal to do with its marketable value. Pruning the trees severely, removing the fruit-bearing twigs, will prevent over-bearing, but at the injury of the tree. Better encourage as many fruit spurs to grow as possible, and make a practice of thinning out the fruit. It will pay to do so. It will look like a waste to one not accustomed to it to pull off a large quantity of growing fruit, as is often expedient, but the superior weight and excellence, when grown, of what is left, will surely satisfy anyone that i, is good policy.

THOUGHTS ON OVER-PRODUCTION AND FINANCE.

We read a good deal about *over-production*, and consequent idleness of manufactories and many poor people thrown out of employment. Now, when we see so many people wanting and needing the very articles which it is claimed are over-abundant—so many people who have not the wherewith to procure these productions which they desire, we are inclined to attribute all such hard times to some other cause. If wealth consists of the produce of industry, the more produced the more wealth, would seem a fair proposition; and the less labor performed the less wealth, as a natural consequence.

Now it will not take many words for us to express our convictions upon this point. What is most needed is the ability to consume. We are personally acquainted with lots of people who would have better houses, better clothes, a great variety of food, better furniture, and a thousand and one comforts and conveniences if they could afford it. They are willing to work for fair pay, and would be glad to be so situated financially that they could consume and appropriate the good things of life without neglecting business. Now if everybody should work, see how abundant would become all the necessaries, and thousands of the luxuries of an advancing civilization. There would be enough for all, at least of the essentials. There never was so big a humbug as this cry of "over-production."

What we want is a financial system which will make money so plenty and cheap—so far as relates to interests—that every one who produces a thing can find purchasers. Then industry will be encouraged, instead of shackled as is now the case. There will be no monopoly of money by the few banks, no usury to consume the earnings, but every one will stand upon a nearly equal plain, where industry will reign supreme.

Now, how can this thing be brought about? By the Government. Currency should be issued and loaned to the people at very light rates to cover the expense of doing the business and to assist in raising revenue to support the Government, which would lessen the taxes. The Government might deal with the people through States, counties, towns, etc., receiving security in all property for the return of the money and interest. In some such way as this, money might become as plenty as desirable, under proper restrictions. Instead of being *king*, money would simply be a servant—a convenience. Instead of being itself a value, it would simply be a representative of values—and in reality it can be of itself no more. *Wealth* would then consist, as it ought to, *of the productions of industry*.

Although a perfect financial system might not correct all the abuses existing among selfish and dishonest men, it would at least deprive money speculators of the power of dictating to industry; it would foster industrial enterprises by paying labor according to its deserts, thus rendering it not only possible, but easy for an honest man to make an honest living.

DESTRUCTIVE CATERPILLARS.

Last year we noticed the caterpillars in Mr. Watkins' and Mr. Gould's orchards in Santa Clara as follows: "In our valley the caterpillars are destroying the fruit crop in some orchards, others they have not troubled. We saw hundreds of trees in Gould's and Watkins' orchards with the foliage stripped from them. They are not the tent caterpillars, but when not eating the leaves cluster together on the large limbs and trunks of the trees. When in this position it would not be a difficult matter to destroy great numbers of them, but we saw no disposition to attempt their destruction, and were told that there was so little profit in fruit culture that it would not pay to spend the time necessary to kill them."

This season there were literally millions where there were thousands of these pests last year. Mr. Watkins' orchard has been stripped as bare as bean poles or last year's mustard stalks. This was done about the middle to the last of May. The consequence is, the bare trees, exposed to the hot sun with stagnated sap, become parboiled under the bark, the bark splits open on the sunny side, borers are invited, and the fruit crop is not only destroped this season, but the trees are ruined forever. Think of fifty acres of orchard ruined by these caterpillars in this way.

Mr. W. has closely examined the habits of this caterpillar this season. He finds that the butterfly lays the eggs only upon twigs about one-eighth of an inch in diameter, mostly on new growth, and that close shortening-in pruning will take the eggs off without injuring the trees. Each insect lays about 150 eggs in a glutinous band about the twig. These are easily discerned by a practiced eye, and may nearly all be removed from the tree during the fall and winter by pruning. What are accidentally left may be noticed about as soon as hatched, as they at once commence work on the nearest foliage in a body and may be destroyed. What few are left, if any, may be killed as they collect on the large branches and body of the trees to rest, when about half grown. One thing we think is clearly proved, it will not pay to let such pests destroy orchards without at least a fair contest of industry and skill against them.

In a conversation with Mr. J. W. Briggs, orchardist, we learn that his large orchard near Marysville was, a few years since, filled with these caterpillars. He thinks they were first discovered on the willows. He made short work of them in precisely the same manner as Mr. Watkins suggests as being the best. We must warn our orchardists to watch out for these pests, and be sure to get the start of them before they do other serious damage.

A GRAND EUROPEAN GARDEN.

Mr. J. C. Schmidt, of Erfurt, Prussia, writes to us an account of his splendid nurseries and garden and conservatories, which we take pleasure in laying before our readers. He accompanies the letter with beautiful illustrations of his places, etc. He says:

During the season I publish eight catalogues: one wholesale list for Germany; one wholesale list for England and America; one wholesale list for France; one catalogue for private persons in Germany, and one for private persons in Austria; one wholesale list for seeds; one catalogue for decorative plants, etc., and one for bulbs.

Under my own cultivation I have 300 acres, with flowers and grasses for drying purposes, but I only cultivate the better species, about one-third of the yearly want, the other two-thirds I have contracted with gardeners.

I have a large steam dye for flowers, grasses and moss, in which about fifty persons are engaged; also, a steam engine for a drying machine, and steam dye halls and large rooms for drying flowers.

In the horticultural establishment and nurseries, 75 to 100 men and 100 to 150 female persons are working. For binding boquets about 150 girls are engaged. Working people in all, 400 to 500 persons.

The department for export contains chiefly fabricates of dyed flowers, grasses, etc., of not surpassed color and arrangement. Further, I export all the raw stuff for florists, viz.: flowers, grasses, mosses, bouquet papers, pot covers, basketware, elegant straw baskets, fabricates of wire, all sorts of home adornment, plants-stands, vases, flower tables, reservoirs for gold fish, etc.

The most important part of my establishment are the hot and cold houses, covering more than three acres of space, one of which is about 180 feet long and contains only palms, the others are for cultivation of Azales, Camellias, and all sorts of plants for cut flowers.

Your obedient servant,

J. C. SCHMIDT.

GRAFTING LARGE GRAPE VINES.

Mr. T. H. Payne, of Santa Cruz, wrote to the editor, last spring, to know the best way to graft large grape vines, five or six inches in diameter. Through somebody's carelessness, the letter has just reached us. Although out of season, we will answer now, and let those who want the information remember for another season.

The time we would choose for grafting would be just as the leaves commence to form on the old vine. The scions should be previously taken from the last season's growth of such variety of grape as is most desirable to propagate. Choose the strongest cuttings for scions. Remove the earth from about the stalk of the old vine eight inches deep, and at least seven inches below the surface make an incision with a chisel into the stalk deep enough to firmly insert the scion, which should be cut wedge-shaped as usual for grafting. One or more of these scions may be inserted. Trim the old vine back pretty closely, but allow it to grow the first year. The reason for this way of grafting, instead of cutting the old stalk off before grafting, is that the circulation of the sap of the vine will not be retarded, and no suckers will be developed and thrown out from the root, as there would be if the old stalk was cut off at once. The next fall or spring, when the new graft is well grown in, the old stalk can be removed with little danger of suckers. When suckers once start below the scion they are very difficult to contend with, as they are likely to come up year after year. By grafting deep enough below the surface, and allowing the scion to get one year's growth before the old stalk is removed, the probability is that no suckers will trouble.

A NEW enemy to the farmers, more troublesome than the squirrel, has put in an appearance in Kern county. The tule rats are destroying wheat fields by the hundreds of acres. They harbor in the tules and live on the roots, but the high waters this year have driven them up into the wheat fields, and as they equal in numbers the locusts of Egypt, they devour a field of grain about as fast as it could be cut with a machine, and having tasted the soft and succulent grain they will not be content to live on the tule roots while the grain lasts. As soon as the farmer discovers that the rats have commenced on a field, he starts in with his machine to cut his field for hay, and if he perseveres he may save about one half of the crop.

EDITORIAL NOTES.

Wheat.—It is estimated that there will be 1,000,000 tons of wheat produced in California this season, and that 750,000 tons can be spared for export. This, at only $30 per ton, will amount to $22,500,000.

Wanted.—A Pet Stock and Poultry Association on the Pacific Coast. This is something that every breeder of fine poultry here desires. Poultry breeders will please communicate with the Editor of the CAL. AGRICULTURIST their ideas on this question, and decide at what time and place they will hold a meeting for organizing.

We have been requested to examine a piece of machinery, report upon it, and send in our bill—this by a prominent business house. It means, give it a favorable notice for coin. We shan't do it. It may be a very good thing, but our poor opinion is not for sale. If you want it advertised, do it in a square manner in our advertising columns. No humbug bribery here.

Is Our Civilization a Failure?—We learn that there are women—white women and grown girls—in San Francisco actually working for twenty cents a day and boarding themselves. This is the result of scarcity of money and abundance of Chinese labor. On the other hand, there is more aristocratic extravagance among the rich women there than under any monarchy. We are fast getting to be a nation of lords and serfs, masters and slaves. What wonder that thousands are yearly driven to desperation, to crime, despair and suicide?

The "Temperance Champion" is now owned by a San Jose printer, Mr. Alex. Murgotten, who is making a good paper of it. Send to him for a sample copy and you will say so, too.

Patriotic.—We have devoted our poetry page to patriotic rhymes this July, 1876, for "Uncle Sam's a hundred," and, like every American, we feel like rejoicing for every step that has been taken toward a better condition of things. The Editor "sacrificed a grandfather" in the revolution for independence, and straddled a horse three years in the Union army during the rebellion, and feels brave for his country, so must cheer the old flag in American fashion.

Hot Days in June.—Our hot weather in June commenced a week earlier than usual and was a scorcher. It ripened off the grain and prevented the rust from doing serious damage. Late sown grain, on heavy lands near the bay, which had not filled, was blighted some. Late sown grain will grow as well as early sown, but two years in three it gets caught in the hot days of June and is blighted. Early sowing, as a rule, is the best for grain, as has been proved over and over again, whether in dry or wet seasons. In our office the thermometer indicated 90° five days in succession.

Our Immigrants.—When the Chinese arrive in California the organized Companies take them in charge and provide them with employment. When American and European immigrants arrive overland, they find themselves at the mercy of wharf-rats, hotel-runners and "employment" agents. No way is provided by which they can be sure of good treatment or work. They find themselves at midnight on the wharf of a great city, without friends or advisers, and at the mercy of thieves and tricksters. Why cannot the citizens of San Francisco and California provide a proper reception for immigrants, and establish a bureau of information for their benefit? Are we less civilized than the Chinese whom we wish to discourage? And must we disgust the very immigrants we should encourage, and see them return to escape from "Californians"? What are our Anti-Coolie clubs doing in this matter? What are our humanitarian societies and our Granges doing to encourage the employment and settlement of immigrants from the Eastern States? These are serious questions and should be heeded.

What About the Wheat Market? That there will be a great wheat harvest is certain. The very uncertain thing is about the market. Without doubt there will be plenty of consumers, as the European crops cannot supply the demand, and the prospects appear favorable for fair prices in Europe. But, as to the prices, it will make $6,000,000 difference to the farmers of this State whether the get one and a half or two cents for their wheat. The wheat speculators are all interested in getting as much of this immense profit as possible. This we can set down as certain. And they are so combined as to pretty nearly dictate terms, if not quite. The Grangers seem to have made no combination for shipping since Morgan & Sons failed, and the buyers are bound to make a good thing this season sure. The terrible scarcity of coin is going to give still greater power to buyers in bearing the markets. They will not only control market reports and prices, but almost compel farmers to sell at such figures as they please to give. This is the way the lay of the land looks to us at any rate.

Honey Prospects for 1876.—Mr. J. P. Gowr, of San Diego, writes as follows:

Bee men in this section are much disheartened. The bees swarmed but poorly, and now the sage is drying up; all the vitality seems gone out of it, and but little of it will bloom. As a consequence we shall have but little pure white honey, and the market is already flooded with the dark and inferior article.

In harmony with other land transactions are the Mexican fraudulent land grants tolerated by our Government. Money influence at Washington will carry through almost anything. A dirty greaser's name, an oath, a soiled bribery record from Mexican archives, gotten up for the purposes, and a few lawyers who manage to get the settlers' money while the grant is being launched on greased ways by some American gentlemen of high-sounding name, and the thing is accomplished. Money does it, and rascals take the land. Settlers who have held lands believing them clear, find this grant floated upon them, and must submit to be despoiled. Individual rights are laughed at, and honest men are treated as though they were villians.

Another grant has been confirmed in our county. The people know it is a swindle, but have no power to protect themselves. How can they when money rules? It matters not whether that money come from the grave of the old Adams Express Co. or not, nor how many men were robbed to get it. Of course it must be all right, or how could such a thing occur in our enlightened community and under a people's government! It is about time to celebrate the Fourth of July with something else than blank cartridges, or to emigrate to some heathen country, where laws are made to protect honest men and punish rascality.

Have pre-emptors of lands any rights that Government is bound to respect? According to several rulings of the Secretary of the Interior, of the Supreme Court and of Congress, they have not. We used to think, in our innocent, youthful ignorance, that when a man squatted on unoccupied public land, and declared his intention of purchasing when it came into market, and occupied the same, fulfilling all requirements of law, his claim was good against any party who might attempt to purchase from the Government. But it has been ruled otherwise in several cases. In fact, the poor settler has no rights that Government is bound to respect. Lands are surveyed and thrown into market at the convenience of speculators and monopolists, script holders, etc., who are apparently in collusion with land offices to gobble it up. For some years past it has looked as though the Government was anxious to dispose of the public lands in large bodies at any price. Large gifts of lands to railroads, and any number of grants to institutions of pretended use to the people, scripts, etc., etc.—any way to prevent settlers from getting lands excepting from land-sharks, at land-sharks' prices. It is high time for the people to demand a different condition of things. Every foot of public lands should be held sacred to the settler, in limited quantities, and obtainable in no other way than by actual settlement, under certain restrictions and requirements that will prevent trickery. The Government can raise revenue without forcing sales of large tracts of lands to speculators. We desire to see this Government become what its founders proposed—a government of the people, by the people, and for the people—instead of seeing it run by and for a class of swindling thieves and monopolists. It is a proper time to comprehend this matter and declare for REFORM.

Home Manufactured.—Mr. Joseph Enright has sold the twenty straw-burner engines that he has made, and is turning off two more to order, which is all he can supply this season. These thresher engines are all made entirely at his foundry and machine shop, in San Jose. He regrets that he is unable to make several more that he has calls for, and so do we, for we verily believe that no better engines—in fact, none so good—are made elsewhere. Mr. E. is a thorough mechanic of many years' experience, and knows what is wanted, and does his level best, which is not second to anybody.

Money Scarce.—There is a great scarcity of money throughout the Pacific Coast country just now. Nearly every subscription we receive is on time, with promise to pay in a few months. We do not complain of our friends, only mention this fact to show the general drouth of coin. The question is, will money be plenty after harvest? The masses of the people seem to think it will, but we believe that it will not be. Money is one thing, and property is another. There is plenty of property, and while bankers are studying how to take advantage of big crops and get big rates of interest, we cannot understand how, under our present financial management, money can be very plenty, unless the people bleed liberally for it. That is how the matter looks to us.

Vested Rights.—When monopolists, of whatever description, who, by intrigue, have obtained power through the generosity of the people, come to use that power against the interests of individuals and the people, said monopolists invariably make a strong point of "vested rights." There are inherent personal rights inferior to none granted by men, among which are "life and liberty," the right to "religious conviction according to the dictates of one's own conscience," and "to pursue happiness" without injury to another. But when it comes to granting perpetuity to a wrong, that is contrary to the principles of a free and enlightened government. All rights, in a public sense, rest with the people or else this Government of ours is a stupendous failure. And the people are vested with power to undo that which they have done when they discover that a wrong is resulting from such creation. We concur with the following ideas of the Memphis (Tenn.) "Southern Farmer" to this point:

Those corporations and their champions who prate of "vested rights," and all that, in opposition to the best interests of the great mass of the people, should remember that the power which has given can take away, and therefore it may not prove wise to claim too many privileges. All privileges covered by charters were given for the public benefit. That was the ground on which they were granted. If it were otherwise, then they were frauds perpetrated on society by the faithlessness of the people's agents. The natural rights of the many are greater than the "vested rights" of the few, especially when these last are employed against public policy and to the injury of those who only could grant them legally. Let every human being have his just rights, and let "vested rights" so called, be enjoyed in subordination to those rights, and the best interests of all classes may be promoted. But "vested rights," so called, will have a hard road to travel when they are sought to be enforced in opposition to the greatest good to the largest number.

THE CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL for June is on our table, replete with interesting matter to the farmer and stock raiser. Subscribe for it and you will perform an act which will greatly enhance your interests.—*Solano Republican, June 15.*

Poetry.

Lexington.

BY JOHN G. WHITTIER.

NO maddening thirst for blood had they,
No battle-joys were theirs who set
Against the alien bayonet
Their homespun breasts in that old day.

Their feet had trodden peaceful ways,
They loved not strife, they dreaded pain,
They saw not, what to us is plain,
That God would make man's wrath His praise.

No seers were they, but simple men;
Its vast results the future hid;
The meaning of the work they did
Was strange and and dark doubtful then.

Swift as the summons came they left
The plow, mid-furrow standing still,
The half-ground corn-grist in the mill,
The spade in earth, the axe in cleft.

They went where duty seemed to call;
They scarcely asked the reason why;
They only knew they could but die,
And death was not the worst of all.

Of man for man the sacrifice,
Unstained by blood, save theirs, they gave.
The flowers that blossomed from their grave
Have sown themselves beneath all skies.

Their death-shot shook the feudal tower,
And shattered slavery's chain as well;
On the sky's dome, as on a bell,
Its echo struck the world's great hour.

The fatal echo is not dumb;
The nations listening to its sound,
Wait, from a century's vantage ground,
The holier triumphs yet to come,—

The bridal time of law and love,
The gladness of the world's release,
When, war-sick at the feet of Peace
The hawk shall nestle with the dove,—

The golden age of brotherhood,
Unknown to other rivalries
Than of the kind humanities,
And gracious interchange of good.

When closer strand shall lean to strand,
Till meet beneath saluting flags,
The eagle of our mountain crags,
The lion of our mother-land.

"Our Patriot Flag."

BY GEO. COOPER.

Hark to the tramp that echoes down the ages.
What flag is that now streaming o'er the air?
The soldier's pride, the glory of the sages—
All honor be to thee, Columbia fair!
The standard of Columbia now unfurl,
While here we meet beneath each hallow'd fold;
To tyrants foul our hate and scorn we hurl,
Welcomes extending as our sires of old!

Thy natal day our patriot flag we hail,
Undimm'd in lustre now each star appears
In faith to thee our hearts cannot fail.
While Freedom marshals on the golden years!
The standard of Columbia now unfurl,
While here we meet beneath each patriot fold,
Thy natal day our flag we hail,
In faith to thee our hearts cannot fail!

The mandates of our fathers we should heed;
One hope be ours, united hearts and hands!
O still shall live each grand and noble deed,
Deathless the mem'ries of our glorious land!
Thy refuge keep for all the world's oppres't
Beneath thy folds we march at duty's call,
While Freedom's fire shall kindle ev'ry breast,
With thee we'll conquer, or with thee we'll fall!

The standard of Columbia now unfurl,
While here we meet beneath each patriot fold;
Beneath thy folds we march at duty's call,
With thee we'll conquer, or with thee we'll fall!

SALE OF JERSEY CATTLE.—The auction sale of Jersey cattle by A. Mailliard, at his ranch in Nicasio, last month, resulted in the disposal of forty-five head. The prices ranged from $75 to $250, which, considering that Mr. Mailliard's is probably the best herd of Jersey cattle in the United States, was very low.

Centennial Song.

BY CARL BRENT.

Twine ye a wreath for the centuries!
Forge me a chain for the ages!
Sing me a song that shall echo
Farthest down history's pages!
Bright wreath and stout chain and great song
Passing the wisdom of ages.

Wreath that through summers and winters
Ever shall blossom and brighten;
Chain that though broken or loosened,
Ever shall strengthen and tighten;
Song that in days that are darkest
Hearts of the people shall lighten.

Here is the wreath; the world's wander;
States in their sovereignty twined,
Here is the chain; it is Union;
States in one nation combined.
Here is the song; it is Liberty's,
Best of the births of the mind.

Years that have passed are a hundred;
Never bloomed blossoms so long.
Canker and rust on the iron,
Yet it is solid and strong,
Discords have come; but the music
Clings to the wonderful song.

FERNERY AND FLOWER STAND.

Once the star-blossoms, in fury,
Scattered, flew out of their course;
Once were the stout links severed,
Burst by a terrible force;
Once was the harmony driven
Back to its heavenly source.

Past the convulsion, the blossoms
Multiplied, brightened again;
Quickly the links reunited,
Sundered and broken in vain;
Sweetly the bars of the music
Joined in the wonderful strain.

Fragrance goes forth to all countries,
Fatal to Kaiser and King;
Still to the chain do the peoples
Lovingly, trustingly cling;
Still the oppressed of all nations
Liberty's symphony sing.

Thus hath it been through the century;
Thus shall it be through the ages;
Thus shall the future behold it,
Fairest of history's pages;
Bright wreath and stout chain and great song
Passing the wisdom of ages.

"Uncle Sam's a Hundred,"

Oh, ye Powers! what a roar,
Such was never heard before—
Thundering from shore to shore,
"Uncle Sam's a hundred!"

Cannon boom and trumpets bray,
Fiddles squeak and fountains play—
'Tis his great Centennial day—
"Uncle Sam's a hundred!"

Stalwart men and puny boys,
Maids and matrons swell the noise,
Every baby lifts its voice,
"Uncle Sam's a hundred!"

Nervous folks, who dote on quiet,
Though they're half distracted by it,
Can't help mixing in the riot,
"Uncle Sam's a hundred!"

Brutes that walk and birds that fly,
On the earth or in the sky,
Join the universal cry,
"Uncle Sam's a hundred!"

Well, suppose he is—what then?
Don't let us act like crazy men;
Must we take to fooling when
"Uncle Sam's a hundred!"

There he stands—our modern Saul—
Head and shoulders above all;
Yet "Pride goes before a fall,"
E'en though one's a hundred.

"What's a hundred in our day?"
Foreign Uncle Sams will say;
"Let us sit and watch the play—
He is but a hundred.

"Granted he's a shapely youth—
Fair and ruddy—yet, forsooth!
He's too young—and that's the truth—
Only just a hundred.

"When he's twice as old, pardie!
'Twill be easier to foresee
What will be his destiny.
Now he's but a hundred.

"When he plays his boyish pranks,
Should he seek to join our ranks,
We'll reflect. But now—no, thanks!
Why, he's but a hundred."

Yes, our Uncle's years are few;
He is young—the charge is true;
Let us keep that fact in view,
Though he counts a hundred.

Don't let's tempt him to ignore
Warnings that have gone before;
Perils both by sea and shore,
Now that he's a hundred.

Let us strive with earnest heart,
Each of us to do his part,
So that he may scape the smart,
Seeing he's a hundred.

And with solemn, graceful thought
Of the deeds that he has wrought,
Guided, cherished, favored, taught,
Till he reached a hundred.

Let us, as we vaunt his worth,
Mingle soberness with mirth,
While we shout to all the earth,
"Uncle Sam's a hundred!"

Ode to Jonathan.

BY JOHN BULL.

I sing a Yankee, latest human growth;
A hero seldom stupid, slow, or flat,
But often over sharp, or fast, or both—
A self-willed, many-titled Democrat,
Squire in New York, and Captain in the West;
A Judge on California's golden strand;
In the Sunny South a Colonel, at the least;
But Deacon in the true old Yankee land.
A rapid traveler to walk with,
Alike through flowers and thorns bound to get
Easy to trade, or drink or talk with, [on;
But very hard for any one to sit on.
Who storms a battery like an old crusader;
Gives freedom to a race some careless minute;
But would buy Satan's homestead as a trader,
And ardently aver "There's millions in it."
To whom equality's a precious gem;
Though sometimes he may kick Chinese or darkies,
And in his secret bosom doth contemn
All foreigners—below the rank of marquis.
In Maine, who ranks in Calvin's fire-proof class;
In Kansas worships God with strapped revolver;
By the dances, in New Orleans, after mass;
In Brooklyn sobs a tear-o'erflowed dissolver.
Who thinks a schoolhouse is a sacred place,
And education cures all mortal phthisics,
But looks askance at high scholastic grace,
In Greek and Latin, French and metaphysics.
Heedless what charm on painted canvas glows;
Indifferent, off to strophe and to stanza,
But listening with loving ears who blows
The western wind from newly-found bonanza.
Yet who, though willing after gold to dash
Through sea and fire, and gloomy ore-lined cavern,
Not often hoards his hardly-gathered cash—
But nobly builds a fourteen-story tavern.
Such is the subject of these brief remarks:
A lawless, pious free-souled money-maker;
Who his cigar would light at Pluto's sparks,
And then try buying heaven by the acre.

The Centennial Hymn.

BY JOHN G. WHITTIER.

Our fathers' God! from out whose hand
The centuries fall, like grains of sand,
We meet to-day, united, free,
And loyal to our land and Thee,
To thank Thee for the era done,
And trust Thee for the opening one.

Here, where of old, by Thy design,
The fathers spoke that word of Thine
Whose echo is the glad refrain
Of rended bolt and falling chain,
To grace our festal time from all
The zones of earth our guests we call.

Be with us while the New World greets
The Old World, thronging all its streets,
Unveiling all the triumphs won
By art or toil beneath the sun;
And unto common good ordain
The rivalship of hand or brain.

Thou who hast here in concord furled
The war-flags of a gathered world,
Beneath our Western skies fulfill
The Orient's mission of good will,
And, freighted with love's golden fleece,
Send back the Argonauts of peace.

For art and labor met in truce,
For beauty made the bride of use,
We thank Thee, while withal we crave
The austere virtues, strong to save,
The honor proof to place our gold,
The manhood never bought or sold!

O! make Thou us through centuries long,
In peace secure, in justice strong;
Around our gifts of freedom draw
The safeguards of thy righteous law,
And, cast in some diviner mould,
Let the new cycle shame the old.

A simple and effectual remedy for the prevention of milk turning sour in summer consists in adding to each quart 15 grains of bi-carbonate of soda.

City Gardening.

TIMELY HINTS.

NOW that your plants are all growing —after the season of planting, etc. —a few timely hints as to summer care will suffice for this month.

See that your heavy plants are properly supported with stakes and strings, and provide trellaces for climbing plants, if not already attended to. The skeleton of an umbrella, a clump of brush, and many other things, when covered with climbers of various kinds will look pretty.

Water, and plenty of it, is the great esiential to success in the garden during the hot months, particularly out of doors. The growth of plants, during hot weather, requires a constant supply of moisture. They might be able to live with little, but the growth would nearly cease, the foliage on the lower stems of plants would turn yellow, and very few blossoms, and poors ones would result. With all the water they want, the growth will be vigorous, the foliage heavy and green and the flowers profuse and beautiful. Generally too little attention is given to this subject of supplying water in proper quantities. In cool spring weather but little watering is necessary for plants. It is then easy to give too much. The plants are usually small, and the loss by evaporation from the leaves slight. Now with full foliage, and a very drying atmosphere, the case is very different. It is a good thing to mulch the surface of the soil with saw dust, tan bark, or sand, to prevent it from drying out quickly, and to keep it cool, Keep an eye on the weeds that they do not absorb the moisture and richness of the soil and crowd the plants. Wash the dust from the leaves with a sprinkler, or a brush dipped in a bucket of water. And again we say, give the plants plenty of water. Don't neglect them a single day.

House and pot plants need an abundant supply of water also, but remember that it is not a good plan to keep water standing in the pans which the pots set in. It is likely to get stagnant and do injury to the plants. Water your pot plants in the top of the pots, and allow them to drain. Hanging baskets need a daily bath, moruing or evening, in a tub, besides a cup of water at mid day. A spoonful of ammonia in a quart of water once a week is a good excitant of growth.

MISTAKES IN FLORICULTURE.—It is fifteen years since I commenced gathering material for flower a garden, and the loss of time and money suffered in the effort to make my garden what it is, prompts me to publish something of my experience for the benefit of others. Of my failures I am not ashamed, for they were only incideuts in honest endeavors for success.

My first mistake was in getting too many kinds of flowers—a very common fault with beginners. The catalogues were faulty in not noting the periods at which the different varieties would bloom. Consequently I had the same shade of colors and form, in Asters, Dahlias, and Zinnias at about the same time—and so with many earlier flowers. I have learned that *one of a class* of flowers, with a full variety of its colors, is enough to bloom at once; and that from three to five classes may be represented at the same time.

My second was a mistske of proportion. I obtained too many annuals and bedding plants. At the end of the season I found that, with the annuals, I was left just where I commenced—with nothing but seeds, and not even those should they fail to ripen. Bedding plants proved expensive, both to procure and to care for. Three of the best double Geraniums and two double Petunias are enough, and if they did not bloom all summer would most certainly be too many.

My third mistake was in getting too many small flowers—in the style of the low Lobelias. It is a very difficult matter so to arrange a garden as to have low small flowers appear to advantage. A flower garden should be showy, and to make it so, showy flowers must be employed.

My fourth mistake was a big one. I mixed things; and here the laugh come in—though it has been a great while coming. I mixed annuals, biennials, perennials, and bedding plants. All sorts, low and tall, were put just where there might be convenient room for them —and the effect was perfectly stunning. It was as if I had mixed the different kinds of seed in a bag and sown them broadcast. It did not take me long to decide that something ailed that garden. I could see the Portulaccas by going behind the Dahlias; while a strong hedge of Balsams and Zinnias stood on guard before the Verbenas. Could I have changed the ends of that spot of ground I would have done it. This being impossible, I concluded to wait another year and change the arrangement. I did this, but it proved no better. The perennials got in the way—and as I was adding every new thing that I could get, chaos might have been deemed order as compared to my garden. Some of my friends said it was nice, and perhaps they thought so. But others thought I had reached the extreme of insanity—and well they might; for the whole thing was so exactly arranged that I never could tell where anything was till it presented itself, and sometimes was well grown.

At this point I might write another chapter. The points I wish to make would render this one too lengthy. Perhaps I ought to say that during all these years I made the natures and periods of blooming of the different kinds of perennial plants a special study—and I now know that no class of flowers will give such thorough satisfaction as a really good selection of them. They are always ready, and, whether the season be early or late, they come along and bloom about the same time every year. Thus you can calculate with certainty what flowers you will have in each week of each month. This cannot be said of annuals and bedding plants, for seed is uncertain and our climate variable. But perennials are sure, and need little care. We have, withal, so many kinds that the garden can be made gay with them from winter to winter.

For beginners I would suggest the following short negative rules as ensuring success:

Do not get too many kinds; some will be neglected.

Do not get too many of a kind; they will weary the eye.

Do not get too many bedding plants; you can buy perennials for the same money, and they will last.

Do not get too much small trash; it will not show.

Do not mix low and tall; it destroys the effect of both.

Do not plant too much ground; there will be sameness.

Do not neglect to care for them; flowers like company.

Follow carefully these negatives, and, as surely as the rain falls and the sun shines, you will succeed.—*E. Hufflelen, Le Roy, Genesee Co., N. Y., in American Garden.*

Sheep and Goats.

CALIFORNIA BRED MERINO SHEEP.

HISTORY shows that centuries ago fine wool was in demand for manufacturing fine fabrics. The Merino of to-day is the result of ages of pure breeding—that is, selecting the best fine-wool sheep to breed from constantly. Within the last hundred years, however, more care has been taken in the direction of improvement than ever before. And in America the Spanish Merino has reached its greatest excellence. Vermont has sent to California finer Merino sheep than Spain ever sent to America. Our herdsmen can, some of them, show, when it comes to superior growth of carcass, finer sheep than ever grew in Vermont. Some have declared that the wool deteriorates in fineness in our climate, but where care in breeding is used, such cannot be the case. The impression seems to have gained ground from the fact that the common sheep of this coast, brought from Mexico, were coarse-wool sheep, and although they have been bred with Merino rams for some years past, there are many coarse-wool sheep among them yet. Pure-bred Merinos in our climate are as fine as any produced anywhere in the world. In this connection, we ask anyone doubting it to examine the wool upon the backs of Merinos belonging to B. F. Watkins, of Santa Clara. His stock is from the best imported Vermont stock, bred with reference to superior fineness, and is certainly equal to anything that can be seen in any colder climate.

THE LATE IMPORTATION.—Harrison G. Otis, editor of the Santa Barbara *Press*, a gentleman who has taken a good deal of interest and who's well posted upon Angora Goat matters, publishes the following in relation to the recent Harris importation, which is sound and to the point:

A press telegram says that "John S. Harris, of California, arrived at Baltimore a few days ago with twelve Angora goats which he brought from Asia Minor after a difficult journey lasting a year. They have already cost him $525 apiece. Harris hopes to make them profitable in the Sierras of California." This is an illustratism of how difficult and expensive it is to import this valuable stock from the distant home of the race, nine or ten thousand miles away. The telegram curiously adds: "This is the first importation of the kind"—which it is not, by any means, as is well known. (That information is exclusively original with the Intelligent News Agent.)

With a fair field for this promising pursuit, and a moderately numerous stock of pure-blood and thoroughbred animals to work with, which California breeders now have, they can breed Angora goats cheaper and better than they can be imported. It has been demonstrated by practical test that the thoroughbred California Angora is even superior to his Turkish ancestor in all the essential points of excellence. Careful comparisons made by us of this fiber from the two countries leads to the deliberate conclusion that the California-grown mohair is superior to the Turkish product in the three essential particulars of length, fineness, and luster; and we believe the average weight of the clip from animals of the same grade and quality is greater here than in Asia Minor.

It is a mistake to suppose that there are no grade Angoras in Asia Minor, the same as in America. Investigation shows that the different breeds of fleece-bearing goats in that country number some twenty. Of these the Angora and one or two others are confessedly the finest. These different breeds are more or less intermingled in some districts. The result is, grade fleeces and a marked difference in the quality of the mohair produced. This is shown in the wide range of prices exhibited by the quotations at Constantinople, the market for Angora, and also at Bradford, the principal English market.

Notwithstanding what has been said in favor of home breeding, importations are to be encouraged by all means. The great point is to get the best blood and to increase the numbers of our flocks, so that the annual yield from them of good, merchantable combing mohair will be sufficient in a few years more to make a decided impression upon the productive results of the State and country.

The Angora takes most kindly to the climate and herbage of California, and is steadily winning his way.

[In regard to this importation, the goats arrived in San Jose in good shape. They are a little smaller than California grown Angoras, but are fine animals. We have endeavored to gain the audience of the proprietor, Mr. Hall, and learn full particulars of this importation, etc., but for reasons best known to himself he is reticent, so we rest the matter for the present.—ED.]

IMPORTANCE OF PURE-BRED RAMS.—The introduction of pure bred rams will annually increase the fleece of flocks one-half pound per fleece. Could farmers be induced to reflect on the importance of this increase, then I have not written in vain. I care not where they purchase their rams, so they get them from a good flock. One to three rams annually do not cost much money, and yet an increase annually of one-half pound becomes an important item.—*Ed.*

A General Complaint.—Here is one of at least fifty letters from all over this State received within the past month by the publishers. We give it merely to show how hard money matters are everywhere. What is the remedy?

PUBLISHERS AGRICULTURIST:—It is a shame that the owner of nearly three hundred acres of land in so fertile a valley as this should be so cramped for ready cash as not to be able to send the pay for the AGRICULTURIST, so small an amount; and though my attention has been twice before called to this matter, each time I have said to myself "hold on a day or two and money to send will be easier with me." But times have not grown any better in this respect. Please continue to send the paper, and I will try to get the money for you before the end of this year.

Yours, truly, O. B. O.

Purify the Press. — A subscriber writes as follows:

I like the CAL. AGRICULTURIST very much indeed. If we could only purify the sources of information, the newspaper press generally, so that the masses of the people learned only the truth; if the coadactors of the press could be prevailed upon to quit coloring things to sustain their own side of public questions, to quit publishing with favorable comments quacks and quackery, humbugs and humbugry, and give us only that that is solid and reliable, society would make a big bound forward and upward; crime of every character would be lessened fifty per cent. in the next decade. N. JONES.

Correspondence.

LETTER FROM KERN ISLAND.

Ed. Agriculturist: Reading the articles of your San Jose correspondents in reply to Mr. Barrel's critique, reminds me of the word-war some years ago on pruning. Both parties are right, or very nearly so. Twenty years ago I was a strong advocate of the subsoil plow, and on lands in Alameda county produced the most satisfactory results by deep culture, causing the land to retain so much moisture that a crop of potatoes, planted the first of June, did well and made a fine yield without rain or irrigation, and a wonderful growth of vegetables was thus produced.

I took that "hobby" to Pennsylvania, and there subsoiled a large field of yellow clay soil eighteen or twenty inches deep, using three and four yokes of oxen —expense, twenty dollars per acre more than ordinary plowed land beside it. I next took the subsoil plow—an invention of my brother's superior to anything of the kind I have seen (no patent on it)— to the rich land on the plains of Tulare county, expecting to put the soil in such condition that irrigation would not be needed; but there it failed me, and after repeated trials I laid the subsoiler one side, and found six inches as good, or better than a foot. So I think, perhaps, both your correspondents are right.

I believe in will be of use on this Kern Island land, and hope to try it another year, then look for accounts of growth. Some of the land may not need it, for to-day I saw a peach tree that was planted last year, when it was less than an inch in diameter, that is now about as large as a New Jersey peach tree at five years. I wish I had measured it for you.

I think this Island about the best place for a man to get a start, if the child will let him alone, and though we came here at the worst time of the year for that disease, it was not so bad as represented —bad enough, but with the help of the "specific practice" of medicine introduced by Dr. Scudder, of Cincinnati, we can manage. Aided thus, we hope to keep moving until the health of the country is improved by clearing the land, planting gum trees, etc.

I will introduce your journal to all my friends. Farmers do not read such papers enough. Yours,

Isaac B. Rumford.

WORKING FOR TEMPERANCE.

Way-Side Watering Places.

Dear Editor: Have you room for an idea about temperance *work?* If the best of lectures and noblest of tracts could make this world virtuous and temperate, the work would be nearly done. But lectures and tracts contain the theory that needs to be followed up by earnest, self-denying hard work and cash outlay.

I once heard of a noble woman who was devoting time and money to the distribution of tracts among the outcasts of a great city. She met a poor child still following the road to destruction and reproachfully said to her, "Did you not read the warning tract I gave you?" "Yes," retorted the girl; "but I could'nt *eat* it, and I was hungry."

In the race for souls, since the world began, the devil seems literally to have had possession of the inside track. Good advice comes plentifully and earnestly from the elect, but the square meals are too often furnished by the devil. I am aware that "the Lord's people," in many of the large cities, are fast waking up to the necessity of taking this inside track out of the hands of the devil and using it for God's glory.

I wish to suggest an investment of some of our missionary zeal and money that would relieve the tired, dust-choked, and in many cases sin-stained traveler from the necessity of calling at the corner grocery for a drink, where often if he takes water it is so warm and unwholesome that if he has a "bit" he is tempted to take a glass of more loathsome drink to wash the water from his mouth. Even if he finds a wholesome drink of cool water, a few meaning glances of "Bar-keep" will make him feel mean if he enjoys a few moments' rest and leaves no cash as he walks on.

I believe twenty-five earnest, patient, temperance men, owning water tanks near the public roads in different parts of the county, could head off two hundred drinks of liquor per day during haying and harvest.

A piece of ground ten or fifteen feet square, thickly shaded by trees, vines or other shade, provided with some sort of stationary seats, a barrel or small tank filled with water cooled by slowly running during the night from the irrigating tank, and a bright, new tin cup secured to the tank by a chain, would be the first, and perhaps least part of the investment in behalf of those needing the "cup of cold water," for tramps and hoodlums would sometimes steal the cup, let out the water and foul the place made for their comfort. Gratitude is not the heathen's first sentiment. If he lives in the south sea islands he may eat his would-be benefactor; in California he is very apt to insult and plunder his best friends.

Could these cool water resting places become one of the institutions of the country, and be furnished with enough water for the use of horses, they would do much towards regulating the water supply that is placed by the roadside, not for the sake of the weary, thirsty animals, but for the chance to sell their drivers a drink.

That part of a pleasure ride endured by the lady sitting in the buggy subject to the stare of from one to a dozen pairs of red eyes whose owners are smoking and swearing on the porch whilst her gallant is watering the horse and making his acknowledgments to the "bar-keep," is not the pleasantest part of the ride.

A "well-to-do Mr. Hayseed" might get into the habit of leaving his daily paper, after reading it, alongside the cool water, for even time enough to rest and look over a paper would be no loss to a homeless man looking for work.

It would be a proper place to post a notice of where work could be had.

It might be a good business investment where fruit is sold from the orchard, as a locked door could be controlled by the orchardist, and an order box like a drop-letter box be made to receive a customer's order as he drove into town, and his fruit be ready for delivery on short notice as he came back.

There are other benevolent, sanitary, and Christian items easily connected with this matter, but this article is already too long.

In the above I aim no shaft at the legitimate country store or wayside inn. I would help a traveler to avoid the watering place *established for the purpose of selling liquor.* C. A. W.

Cozy Nook, June, 1876.

COOL WATER.

Ed. Agriculturist: Have you room for a few lines about cool water, and a few hints about how it can be easily supplied on every farm?

Our nights are so cool that a small stream of water running slowly a few rods will become cold enough to be very refreshing all through the day.

The arrangement may be very simple and cheap. Two syrup barrels and forty feet of trough will do it. The barrels will cost about two dollars, and should be thoroughly scalded and washed to take out the syrup taste. Set one near the water supply, and fill it. Set the other in the best cool place within reach. Hop vines will grow and cover an arbor for the barrel very quickly. Leave the shelter open on the north side. Before going to bed at night turn the faucet at barrel No. 1, so a small stream will run to No. 2, at the same time draw off the water left over in No. 2 to moisten the surrounding shelter.

The plan can be modified to suit circumstances. The water may be located in the milk house, but should be so arranged as to leave no permanent dampness about the floor. Where there is a tank raised from the ground a small pipe can be inserted and the water run any desired distance, and the larger the body of water thoroughly cooled by the night air the cooler it will keep through the day.

I have practiced for years drawing a barrelof water out of my irrigating ditch, taking care to fill the barrel in the morning before the sun shines on the ditch. I never doubt its paying for the bother we have only to neglect to fill the barrel one day and we have no doubt about it rfterwards.

In the cities where ice is plenty perhaps a tank of cool water is not so necessary, yet I think there are many places where its cool waters and surroundings would be welcome. Where the city water comes into the chambers it would be easy to pass a small pipe through the wall and around the house into a lower room provided with a tank that would have a cooling infinence on the whole house, and by passing the water through a filter before ft entered the tank it would be improved in every respect. C. A. W.

Cozy Nook, June, 1876.

Stock Breeder.

FINE STOCK and INTELLIGENT FARMING vs. RANCHING.

MANY persons here and in the East who read about stock raising in California seem to have an idea that it must be very nice to get hold of a few thousand acres of wild hill lands and cover the same with stock *a la Mexicana.* But we who have resided on this Coast for years have seen reasons for harboring a different opinion. There was at one time an excuse for this loose method of ranching, when the lands were open and without settlers, and not in demand for settlement. The old *vaqueros* could better afford to take their chances of losing by drouth the increase of years of plenty. And if the cattle could live through short feed the hides and tallow when it was flush would pay well enough to satisfy an indolent ambition. Such stock raising has about ceased to be desirable in this State. Only a few half-civilized adherents to it are to be found. Slowly and reluctantly they have fled before settlers and the no-fence law, which forced stock-owners to take care of their stock and not allow them to eat up the farmers' crops with impunity.

These old stock ranchers have been the worst enemies the real settler has had to contend with. Any advance that has been made upon public lands that they have ranged over, has been stoutly resisted in every way they could contrive by trickery and persecution. Within a few years—just prior to the no-fence law, which we made enemies as well as friends by advocating—it was as much as a man's life was worth to pre-empt and occupy such lands. The settlers' crops were destroyed, and armed men would threaten, and often execute threats, with pillage, rapine and murder. Nothing less than a colony, or strong combination of armed settlers, backed up by law, could protect them from all sorts of abuse and damage from these cattle and sheep herding land monopolizers. They made no improvements upon the lands, and little or none in their own herds, but generally were content to, Arab-like, prowl over the plains a wild, pastoral people. They combined, as much as long distances would admit, to hold their "vested" rights. But thanks to the pluck of a few daring spirits, and to advancing civilization, they are fast succumbing.

As they retreat before cultivation the real stock interests of the country advance. With cultivation comes a higher branch of stock farming—better breeds of stock, better pastures, and something to eat when pastures are short. A diversified system of intelligent farming is always favorable to stock raising and stock growing, and to improvement in the breeds of stock.

Until very lately our breeders of fine stock as a specialty could find no encouragement in their business. Several persons from the East who have come here with best breeds have met with nothing but disappointment. They supposed that this State, being a stock country, would furnish a market for their fine breeds. But they have found that it requires civilized men to appreciate and patronize the best stock. As the cattle men are obliged to contract their herds before the encroachments of settlers, some of the most enterprising have purchased fine stock to breed up their scrubs a little. But, as a general rule, the farmers who till the soil are the ones who demand better breeds and make it pay to improve. Every alfalfa field creates a demand for better stock. Every well-conducted farm needs better stock, and the better the system of farming the greater the need, and the demand also.

During a portion of the year only the uncultivated lands afford valuable pasturing. We know of several valley farmers who also own hill farms where they turn a portion of their stock during good pasture, and provide feed on the valley farm for them to eat during the balance of the year. They find it a money-making business.

Another element against stock improvement is the *all-wheat* rancher. There is no improvement of any kind about such an one, only to get the best machinery to run things on a grand scale. He may make money, or lose it. He is a chance-taking farmer, and regards his undertakings as a speculator in mining stocks does, as either a winning or a losing game. He is just one step, and only one, in advance of the wild stock raisers, and must eventually give way to a better system. He stands in the way of settlement, and as long as the big land monopolists control things and obtain high rents for lands for such pur-

poses, settlers must stand back. When civilization surrounds them and advances the price of these large tracks, and the degenerated monopolists die, and in the course of time titles split up and naturally fall to pieces, then will these lands become peopled and improved.

At the present time the out-look for fine stock interests of all kinds in this State is encouraging, notwithstanding the fact that the late annual sale was a failure. There were several reasons why besides those we have already given. The interests of the fine stock breeder with those of the good farmer are identical. Both are aiming to improve. The intelligent farmer must have the fine stock, and will eventually. There is no question about that. Let the breeder of fine stock lend his encouragement towards a better system of farming, and let the enterprising farmer patronize the intelligent and scientific stock breeder, and let both take and read the CALIFORNIA AGRICULTURIST, and we may all be happy yet.

CLOSE BREEDING.—Here is what we regard as sensible talk. Breed good qualities regardless of relationship. A writer in the *Western Farm Journal*, after alluding to a discussion on the subject by the Stock Breeders' Association, says: It has been supposed destructive to good breeding to go into any of the forbidden degrees of relationship. If a neighborhood was enterprising enough to buy a fine bull, or horse, at great expense, after a certain time the animal and all his progeny must be discarded for fresh blood, which must be imported at a further increased expense, or the original improvement went for nothing and was lost. In this way, many good breeds have been frittered away and wasted, because the importation could not be kept up and maintained indefinitely. This position is nonsensical in the extreme, as every intelligent breeder ought to know.

How was it possible for Bates, or Webb, or Bakewell, or any of the original improvers of stock, to maintain the superiority of their breeds? They had no other choice strains to run to, if they had desired to do so ever so much, for there were none in existence. It is more than probable that, if there had been, they would have kept on as they did, for when they once got a good animal, they carefully preserved all his good qualities by breeding to others possessing, as near as possible, other good points. They were compelled to do this regardless of relationship for the reasons above stated.

It is now quite certain that the only way to maintain a choice breed of stock is to keep up the intercourse between them, regardless of relationship, so long as there are any good qualities worthy of preservation. Any system of breeding which is based on any other principle is founded on error, and is sure to fail, as so many of our previous attempts at improving Western herds have failed.

The true principles of breeding necessitate pruning the herd, therefore all female animals are endowed with a time of heat, which faculty attracts the males of their kind, and inaugurates nature's requisites to the perpetuation without deterioration. Of wild animals the pruning of the herd is successfully accomplished by the fighting of the males unto death or banishment from the herd, leaving the most vigorous males to propagate their kind; the buffalo, elk and deer are instanced, showing no deterioration either in form or vigor, and fairly represent nature's standard, which is perfection, matured by the true principles of breeding in line, and concentration of blood to that extent necessary to perpetuate merit.

In breeding it is a correct principle to avoid the same defects on both sides; care should be taken to balance defects on either side, with perfection on the other.

OVER-FEEDING FINE STOCK FOR SHOWS. It is astonishing that breeders will be so foolish as to still continue the practice of stuffing, to their ruin, valuable animals from their flocks and herds, simply for the purpose of outshowing each other in monstrons fat at the agricultural fairs. See, for example what dsstruction has resulted for years past from this cause in the noble tribes of Bate's and Booth's Short-horn cattle. It is not surprising that many have died under this practice; the only wonder is that a single animal of them has survived it, and is still left with sufficient stamina to propagate its species. In a late issue, the London *Agricultural Gazette* observes that this lamentable destruction is going on in other superior families of Short-horns, and also in other breeds of cattle, for it says: "Mr. Outhwaite has lost his celebrated cow Vivandiere. She and her calf have both died during protracted labor. The North British *Agriculturist* of last week enumerates the disasters which have of late befallen prize animals. Among them, Mr. Kennard's Queen Mary, which has lost her calf; Mr. A. H. Browne's Duke of Aosta, winner of many prizes, including the first at each of the three national meetings in England, Scotland, and Ireland, last season; Lady Pigot's Victoria Victrix, Rose of Wytham, and Moorish Captive, all of them royal winners; the Duke of Buccleuch's prize winning Ayrshire cow, and Mr. Scott's fine polled Angus bull Bluebeard. We rather suspect," says the *Gazette*, "that the unnatural state of feeding in which showyard animals now-a-days appear has had not a little to do with the death of some, if not all the animals particularized."

Yes, indeed, you may "rather" more than "suspect" this, for it is a terrible fact, and no mistake about it. I well recollect when present at one of the royal agricultural shows in England of expressing astonishment to a celebrated breeder there that he should sell a lot of his prize animals to a competitor. "Why," I exclaimed, "in a few years he will be exhibiting here against you, and beat you with the produce of your own weapons." He gave me a nudge with his hand and a sly wink with his eye, and at the same time dryly remarked: "Never fear that. These animals have been fed too high to make good breeders; the purchaser of them can never beat me at a cattle show with their offspring."

And still, with such a lesson before us, we Americans are so foolish as to continue importing prize stock from abroad, and boast of it to the public, thinking thereby to be able to sell their produce at a much higher price than such as come from animals that have not gone through the injurious process of overfeeding, in order to make a foolish show of their fine points.—*A. B. Allen, in the American Agriculturist.*

[Here is a subject for the California Stock Breeders' Association to discuss. Several head of fine stock have been lost in California from this cause. It would not be a bad plan to rule out all animals that are too fat from competition in the ring altogether.—ED.

MANAGEMENT OF LARGE BULLS.—All stock breeders know that large bulls have a perfect disregard for fences, and therefore have to be kept in the stable, sometimes for years. Experience has shown in most cases where bulls are kept so confined, without air or exercise, that they become either impotent, or very precarious stock getters, also headstrong and dangerous to handle. I kept a Short-horn bull six years. When he was a year old, I began handling him with a rope similar to one ordinarily used to cast a horse. He would make great resistance, and after a struggle would have to come down. I repeated this every six months that I had him, and he never knew that he had any strength. His lofty head was leveled to the ground in a manner very humiliating to him; he was always as kind as an ox, and any child could lead him to water. Throwing him took the conceit entirely out of him.

I then invented a plan to exercise him. I set a post in the ground about three feet high, with a cart wheel on top, then lashed a sixteen-foot ash pole across it, made a frame for his neck at the end, so that the pole would lie against his breast with a rod running out in front to tie his strap to. He very soon learned to go round, describing a circle thirty-two feet in diameter, with a good track. He was put in this every day, and would walk two hours. After a few days he needed no attention, as he seemed to enjoy it, and was so impatient to start that we could hardly hold him still long enough to tie him.

The result of this was that he was the most active bull I ever saw; and out of eighty-seven cows served this summer he was four years old, only four missed. Some of my stock breeding friends have tried these experiments, and say that they have been the means of prolonging the usefulness of their valuable bulls for years. We all know that far too many of our high-priced and choice bulls go prematurely to the shambles in consequence of the above troubles.—*Cor. Country Gentleman.*

ADVANTAGES OF RAISING STOCK.—Farms which are devoted to raising stock that consume the crops grown upon them are less rapidly exhausted than those from which the crops of grain or hay are sold. Upon farms where the grain, hay and straw are fed to stock, the farmer may realize a double profit. First, by the profit arising from the sale of his stock; and second, from the larger quantity of manure he makes and applies to the improvement of his fields and thereby increasing the quantity of grain, and thus he is enabled to add to the number of his stock.

PROFITABE GRADES.—One of the great causes of disappointment, says a correspondent of Coleman's *Rural*, to those farmers who attempt to improve their stock, and then are dissatisfied with their success, is because they work on the cost-nothing plan, and get the cheap kind. That is, they start their improvement by getting a grade of its kind, ignoring the fact that the pure-bred animal, when coupled with the grade, or cold blood, produces an offspring that cannot, with any certainty, reproduce its like in form or fattening properties. Many men will ask, Why is it so? It is because the pure-bred has been the result of scientific breeding and feeding for a limited time, while the scrub has been an amalgamation of races from generation to generation, without an effort to improve those essentials that make them profitable to the farmer. A pure breed can be raised just as cheap as a mixed breed. Each breed has its peculiar characteristics; and the farmer must first ask what he wants in an animal, or of an animal, and then get the breed that most nearly meets his wants. Then he wants to keep it pure. By buying pure males occasionally, if he is not able to do more, he can keep the breed pure, and keep it improving, too, if he uses care in his selection of breeding animals. Then, if he has male or female animals to sell, he can get as good prices as he has had to pay. He can sell his stock for three or four times what it is worth for meat. It costs him no more to raise it, and any surplus stock he has, he can convert into meat just as well as the mixed breeds:"

HOW TO EDUCATE A BULL.—The *Country Gentleman* says: A bull should always be so fastened that he cannot strike his attendant with his horns. He should always be handled with a staff fastened in his ring, and be taught to obey when led, just as a horse is taught. If he shows the least disposition to use his horns when being led, a twist of the staff will teach him better. He should be handled in the stable as a horse is taught to be, and should, for the sake of his health, be carded and groomed to his feet, as is a fine colt. When currying his head and neck, always have a firm hold of his ring, and never allow him to think he can push, hook or even frighten the attendant. Always keep him well groomed.

ARE TENDENCIES OF CHARACTER INHERITED?

BY NELL VAN.

"WE do not live for ourselves alone," said a mother whose pathway through life was not entirely strewn with roses.

The words sank deeply into my heart, and I love to feel that they are echoing and re-echoing throughout space for an eternity. If we fully realized that those who come to fill our places upon earth, bearing our blood in their veins, and with it the transmitted traits of character and peculiarities of temper we possess, would we not be more constantly on our guard, and strive more heartily for perfection? The atmosphere becomes tinctured with the prevailing sentiment of our lives, and the harmonious blending of contentment, forgiveness and sympathy, with no nervous anxiety about the future, produces a condition of peacefulness that all might envy.

Such thoughts as these were passing through my mind as I sat in a friend's house, whither I had gone to pay a brief visit, when I heard a child's plaintive voice in the entry saying: "Do, ma'am —*please* do let us come in; we are afraid to go home now, and if *she* see us we'll have to, and oh—" A flood of tears here relieved the grief-stricken little heart, while, with kind, soothing words from my friend, two little forlorn specimens of humanity were led into the sitting-room.

A bright, cheerful fire burned in the grate, and Aunt Liddy sat in the soft twilight knitting. Seats were placed where two pairs of chubby hands might feel the warmth of the fire, while little by little we ventured to draw from their owners the tale of sorrow which led them to seek shelter under my friend's hospitable roof.

"There she goes now!" said one of them, pointing through the window. "She's looking for us. Oh! ma'am, don't let her in here."

"No," said my friend, "you are perfectly safe here. But is she your own mother, child?"

"Yes, indeed, and a kinder one you never saw when she's in her senses. The man in the shop there always gives her a drop too much, she says, and then she never knows what she's about after that."

Then the younger one spoke up, "And she sings, and boys follers her and chuck rocks at her, and she fall down, and the mans come out of their stores and tells her to stop her noise and go along. And she gets up and sings louder. See, lady, she is going through the park awavin' her handkercher. Oh! won't we catch it, Polly when we get home, unless we wait till her is asleep?"

My heart ached for the little souls thus dwelling upon their early grief, and my eyes followed the clumsy movements of the woman they dreaded, who, lost to all sense of shame, was attracting the attention of passers-by with her loud, coarse laughter and wild singing. What more repulsive sight than a woman thus degraded!

Aunt Liddy had risen and gone to the window, where, shading her eyes with one hand, she sadly gazed and sighed, then muttered, half aloud, "Poor, forlord creatur! Nobody to save her from herself. Lor' sakes alive! Marian, if she don't look like Mirandy Jones as lived at Newton Corners. Don't you mind the Joneses as had such a heap o' trouble with your uncle Hi about land? Well, Seth Jones he married an old schoolmate of mine, and Mirandy was one of their first children. The oldest was a boy, and he sickened and died. Mirandy she"—

"Yes, that's what Gran'pa calls her now, Mirandy, and he lives down at the Corners, and we was there once, but they wouldn't keep us no longer, 'cause father fit with their hired man, and so—well, we come away arter that," interrupted the little one.

My friend here stooped down to soothe the children by coaxing words. She enquired their father's name, and what he was doing.

"Oh, he works on the railroad, and sometimes he comes home, and more times he doesn't. Then he stops at the shop, too, and gets a drop, but then he goes to sleep there, and maybe don't come home till mornin'—leastways we are mostly gone to bed afore he comes,so we gets no floggin' But she beats us, you'd better believe. Onct she hurted Polly's nose till it bled, and I runned away. Oh! dearie me! I wish—I wish my mother was like you, and never drinked a bit nor beat us!"

"Here, durlints," said kind-hearted Biddy, coming into the room with two saucers of strawberries, with a piece of sponge cake and a spoon in each saucer. "Dry your tears now, for the lady here told me to bring this to yees, the purty childers."

The sight of the fruit brought smiles to the lips and tears of gratitude to the fringed eye-lids. Polly shook back her tangled curls, and said "Thank you—thank you. Aint they nice ladies, Betty? Why don't you tell 'em 'thank you,' as I do?"

Slowly rose the silent Betty, and laying her hand in my friend's she whispered, "You are so good to us lady, we cannot thank you enough."

Then they fell to eating, and right hungry they seemed to be, so Biddy was told to bring them some biscuits and butter, which she did, and they were also eaten with a keen relish.

All this time Aunt Liddy sat busy with her knitting, her thoughts, doubtless, wandering to her youthful days, for she nodded her head and muttered, "Yes, Miranny Jones married Joe Hodgkins, and they settled—I don't mind the name of the place. Well, well; poor dears! Their lives begun under a cloud, sure enough."

It was getting dark, and the children began to feel uneasy to get home. Deeply interested in the little ones, I offered to take them home and see the condition of things there before leaving them to the tender mercies of anybody. So, slipping on hat and shawl and giving a hand to each, we hastened through the park and down a quiet street till I was shown into a back room of a respectable-looking house. Here a scene met my gaze that never can be forgotten. A woman about thirty years of age lay sprawling at full length upon the floor, with her bonnet crushed, her shawl torn, and her features distorted. Can this be a home? thought I. The disorderly condition of the room; the table standing filled with unwashed dishes; the stove filthy; a lounge piled up with soiled clothes on top of which a cat lay asleep.

As we stood in the doorway considering what was best to do, we heard steps approaching, and some one whistling came in upon the scene.

"Hello! Hello here! What's up here! That you, Mirandy? Been at it again, old gal? Haven't I told you—" Then, perceiving a stranger, he began bowing and scraping, saying, "Take a seat, Miss. Sorry times these! That there woman (would you believe it?) goes at it regular. The children here can tell you what a hard time I have of it, comiug home tired from my work to supper, no fire, and she like that. 'Tis enough to drive a man mad, it is. As true as my name's Joe Hodgkins, I'll not stand it much longer!"

Stepping forward, I said, "Are you the husband of that woman, and the father of these children? And do you pretend to say that you never take a drop yourself? Have you not, by your example, taught that woman this dreadful habit?"

In my indignation, I said much more, and never an answer did the man offer in explanation. Thoroughly ashamed and crushed, he helped me lay the unconscious sleeper on the lounge, where I left them, with the promise of returning on the morrow to have a talk with the woman.

Hastening back through the darkness, I related to my friend the result of my visit, and then it was that Aunt Liddy told us an incident in the early life of Miranda Jones which teaches the truth of the scripture, "The fathers have eaten sour grapes, and the children's teeth are set on edge."

"Mirandy Jones," said Aunt Liddy, smoothing her apron, "was the oldest gal of Betsey Snell, as was. We were gals together, and she married a Jones, as I said afore, and set up house-keepin' at Newton Corners. Now Seth Jones (Mirandy's father) was a drinkin' man, and they allers had sperrets in the house, and many's the time I've seen, with sorrow, the children feed with the leavin's of sugar in the brandy glass. Not brandy, p'r'aps, but 'toddy' they called it in them days. But I'm ahead of my story. Where was I? Oh! When Mirandy wasn't more'n a month old, I used to visit there proper often, and time an' ag'in I've seen Betsey feedin' o' that babe gin and hot water, sweetened, to cure collicky pains. Says I to her, 'Why, Betsey, you'l surely give the child a taste for strong drink;' and then she'd laugh and say, 'Why, Liddy, everybody gives babies drops to start the wind; in course they do,' says she. But I thought not, and cried against it every time. 'Father drinks toddy, and gin-toddy is good for the baby,' she would say. So that was the beginning of poor Mirandy's fate.

"When the other children came along, they were fed the same way, and all turned out drunkards, as I knew they would. They was all boys, and 'twa'nt thought nothin' strange. But I never heard how Joe Hodgkins and his wife got along, but the minute I clap'd eyes on that woman I felt sure it was Betsey's child. Dearie me! How shocking! And will those pretty dears have the same inheritance, I wonder? Marion, come, let's have a light, and let's think of something else to try to forget what can't be helped."

Another instance of hereditary transmission, thought I. In whatever direction we turn, we find humanity subject to the same law. Not only the perverted tastes of parents are visited upon the children unto the third and fourth generation, but talent is likewise handed down — sometimes lost sight of in the first, but re-appearing in the next generation. We find families of doctors, where father, son and grandson are natural surgeons. We hear of artists whose immediate descendants show no remarkable talents; but among the children's children will be found traces of their grandfather's art. It is the same with music. Even in home matters the same law of inheritance prevails. The thorough housckeeper leaves a taste for such pursuits, though early habits combined with the talent produce the perfect manager.

Oh! ye mothers! Since three-fourths of our happiness in this life depends on the comforts derived from a well-appointed home, see to it that you leave such an inheritance as will cause future generations to bless your name for ever.

Poultry Yard.

HATCHING CHICKENS IN HOT WEATHER.

BY AGNES.

THERE is one very good reason why chickens should not be hatched during the warm months of summer: It produces a hot-bed for that terribly troublesome little insect, the flea, which becomes such a source of annoyance about some farm houses that sensitive people are glad to quit the premises.

If any one wishes to test the matter, let them sit hens in the mouth of August. Unless much time and care have previously been spent upon the hennery, before three weeks have passed, the nest will be covered with very small insects of a grayish color. If allowed to remain, in a day or two more these will have grown a little larger, become of a blood-red color, but retain the same shape as before. Visit the nest again in one or two days, and you will find these animals changed to the form of a flea, and of a brown or black color. Allow them to remain louger, and when you return you will find these back-biters in the condition of "Paddy's bug"—not there, but migrating in every direction to stock the farm and its buildings.

For this reason houses and yards should be prepared purposely for poultry. If fowls are allowed to roost on trees and in barns, the result will, in time, be serious.

A Newhampshire dealer in fancy fowls sings the praise of his favorite breed in the following unique hymn:

If you want some feathered st
That will not your wishes m
When at their nests you daily kn
Buy some eggs or get a fl
Of the famous Plymouth R

FINE POULTRY BUSINESS IN CALIFORNIA.

A gentleman writes us from the East inquiring whether the business of raising fine poultry in this State will pay, stating that he has a lot of fine pure-breds that he can bring out here with him if there is sufficient inducement. Now, when it comes to advice, we small neither advise one to come, nor to stay away. But we will make a few statements in regard to the business of poultry raising here, and leave it to the judgment of whom it may concern. First, it will pay to make a business of raising fine poultry, if the business is rightly conducted. The demand for fancy breeds at fancy prices is very limited, but there is a good general demand for good breeds at fair prices. The market for eggs for consumption is always good. Eggs are never lower here than 25 cents per dozen. Common hens are worth $6 to $8 per dozen. In a good locality where there is pure water and good range and plenty of shade, and the poultry are supplied with a variety of feed, and can get green feed all the year round, poultry are as healthy and as easily raised and cheaply kept as in any other country. Probably there is no country where they can be kept at a better profit, when produced for market, both poultry and eggs. We think that the business of fancy fowls exclusively could be carried on with greater success East than in California. But for one who designs to keep best breeds for profit, and to breed fine fowls, also eggs to be sold at reasonable prices to such as wish to improve their stock, we are certainly setisfied that there is no better place than California, and in California no better place than in the vicinity of San Jose.

Lands within ten miles of San Jose can be obtained from $60 to $600 per acre. One hundred dollars per acre will get as good land and locality as desirable.

The worst thing to contend with here in the poultry business is vermin, which breed in our climate wonderfully fast. And an important injunction is, in our dry season, to supply plenty of green feed, as poultry will not keep healthy without it.

While caring for the poultry, an orchard can be started and kept growing in the range as well as not. Indeed, there are no two branches of farming that pay better together than orcharding and poultry raising.

CAME FOWLS.

Mr. L. E. Matteson, of Stockton, whose card can be found in our Directory, writes as follows.

Mr. Editor: With the additions I have made to my breeding stock the past year, from the Eastern States and Europe, I have now the finest collection of Game fowls on any one breeder's yards on the Pacific Coast. My stock consists of the following varieties: English Black-breasted Reds, willow legs; English Black-breasted Reds, white legs, of the Sir Heathcoate strains; and Fish Blue Grey; all imported by myself. Also, the following American varieties: Tartars, Batlers, Eslins, Jack McClellans, and a fine strain of pit fowls. Should I receive any orders through your agency, I will guarantee satisfaction to first hands. All birds are warranted thoroughbred and true to name. References from former customers given if necessary.

Respectfully, L. E. Matteson.

Keep Chickens Scratching.—The following, from the *Journal of Horticulture*, is very sensible: "Shelter afforded by

doors and posts is almost useless. We want the shade of living undergroth, beneath which the chickens can creep and rest. Chickens, again, must be occupied. Those runs which are only a few yards square, and which are daintily swept over every day to make them look tidy for visitors, are useless for chickens. Nothing can grow or keep healthy in those smooth billiard-table-like runs. Chickens want to be occupied and must be kept busy. The runs must be dug up and piles of the loose dirt thrown up one day on another, and the chickens will delight in leveling these. A capital way to keep chickens on the scratch is to throw their whole corn always down among loose dirt or a lump of straw. The sexes, too, must be separated in good time. Some breeds are more precocious than others, and so we can fix no reliable date for their separation; it must depend on the breed and breeder's experience. There is, however, another point which we think quite as important—namely, moving every little while the pullets of the larger breeds, where size is a desideratum, from yard to yard, for we are convinced it retards maturity and laying at an early age, and so greater size is produced."

Cure of Gapes.—The Lancaster *Farmer* says: "In a recent conversation with an experienced chicken raiser, he informed us that he had been very successful in conquering the gapes in young fowls by the application of air slaked lime. As soon as a manifestation of the gapes appears, he confines his chickens in a box one at a time, and places a coarse piece of cotton or linen over the top. Upon this he places the pulverized lime, and taps the screen sufficiently to cause the lime to fall through. This lime dust the fowl inhales and it makes it sneeze, and in a short time the cause of the gapes is thrown out in the form of a slimy mass of worms, which had accumulated in the windpipe and smaller air vessels. This remedy he considers superior to any he has ever tried, and he seldom fails to effect a perfect cure. He has abjured all those mechanical means by which it is attempted to dislodge the worms with instruments made of whalebone, hog bristols or fine wire, alleging that people are quite as apt to push the creatures further down the throat of the fowls as to draw them up.

An Egg-Preserving Pickle Recipe.—Three quarts lime, tablespooeful cream tartar, one cupful salt, and water enough to fill a five gallon can; after seventeen dozen eggs have been carefully put within the can. To the water add the other ingredients, stir up well and pour it on the eggs and keep them in a cool place entirely covered by the pickle.

The lady subscriber who furnished the above keeps her eggs perfectly sweet with the above treatment, and by special request, after writing the above recipe, she boiled me an egg that had been in pickle four months, and I found it perfectly sweet and free from all shadow of taint or any objection of any kind, and would trust them fully as soon as the freshest eggs in any of our markets. She usually gets the highest price of fresh eggs, and does not sell till they are about fifty cents a dozen.

Feeding Fowls pepper. I witnessed for the first time, at the late Crystal Palace bird show, the results of pepper feeding, and was greatly pleased, as well as surprised, at the wonderful improvement in color of the numerous specimens so treated. I look upon the treatment as fair and legitimate, and in no way deserving the name "trick," which, I am sorry to say, has been applied to it; such a term of reproach should be reserved for all dishonest interference with the outside of competing birds, such as drawing, trimming, or staining feathers. Whatever can be effected through the medium of the secreting organs of any bird cannot fairly be termed artificial or unnatural, unless everything be so named which differs from the mode of life and food of the bird in its original state.

The object aimed at in the treatment of all domestic animals is an improvement upon their natural or wild state; and in the case of the canary bird bred in confinement, cayenne pepper, voluntarily eaten, is no more unnatural to it than the egg and cake with which show birds have been regularly fed for years. The system of maulting birds in close, warm cages, feeding them at the same time on more stimulating food than simple seed, has long been recognized as a necessity, where depth and richness of color are desired.

The new mode of feeding on cayenne pepper is simply an extension of this rule, and whether discovered accidently or as the result of an experiment, is, in my humble opinion, the great improvement in the treatment of our favorites that I have witnessed. If it could be shown that the health of the birds was injured by such food, there would be some ground for objection on the score of cruelty; but, as from all I can learn, such is not the case, but rather the contrary. I, for one, hail the discovery with great satisfaction. Depth of color has been the point chiefly aimed at in many varieties of canary, and here it is beyond the expectation of the oldest fanciers, and permanent or not, according to the continued treatment of the bird. I would, in conclusion, lay down one simple rule for all, viz: Put whatever you like inside the bird, that it willingly takes without injury; but forbid, under the strictest penalties any interference with the outside.—*Cor. Poultry Review* (*England*).

Poultry Profits.—Every year poultry keeping grows more profitable. We do not refer now to the rage for fancy fowls, but are speaking of the profit in raising fowls and eggs for the city market.

As the progress of civilization creates great cities, and sets apart extensive classes of dwellers indoors with appetites for articles of food less hearty and gross than the pork and beans, and cornbeef, and rye and Indian bread of our ancestors, the demand for the products of the poultry yard increase.

Farmers who have been heretofore in the habit of making poultry-keeping as "small potatoes," are waking up to the fact that there is sometimes greater profit in it than in more pretentious operations of the farm.

The valuable importations of fowls made in late years are encouraging to the pursuet, and the study given to improve management augments the profits.

Eggs by Weight.—We have advocated the plan of selling eggs by the pound for years, and now we see an opening to bring the thing about. We think it as unfair to sell eggs by count as it is to have short weight in raisins: On testing the difference we find about this result: Small eggs will weigh say one pound per dozen, medium one three-fourth pounds, while large will weigh two one-fourth pounds. We think that one three-fourth pounds is about a fair average. We buy about fifteen hundred dozen per month from producers, and we find all the above difference in the weight. Parties claim that the hens that lay the small eggs will lay the greatest number. Now just see what a premium we are paying for the production of an inferior article. We still notice, and this by experiment, too, that the shells of two pounds of meat from the small eggs weigh nearly double that of the large eggs. We will try to explain our idea: For instance one woman brings us four dozen eggs that weigh four pounds; we pay her eighty cents for them; she says nothing; it is her due, twenty cents per dozen for her eggs; another comes, has two dozen eggs, we pay her forty cents, weigh her eggs, and find she has four pounds, and she does not complain—twenty cents per dozen for eggs. Now, we say justice demands that we pay at least as much for the two dozen that weigh four pounds as we do for the four dozen that weigh four pounds, while the shells of the four dozen weigh much more than the shells of the two dozen. Difference in these figures are intended for extremes, yet it is of every-day occurrence that we find them both. Our opinion is that the price should be based on the rate of ten pounds to the 100 eggs.—*Cor. American Grocer.*

Poultry Dough.—We disagree with those who recommend a thin batter of oat, or corn-meal for fattening fowls. Beer moisten the meal just enough to keep it together and then give the drink by itself. It is well known that dyspepsia may be induced in the human subject by an exclusive diet of thin soups. The philosophy of the matter is, that the gastric secretions are so diluted, that they are not strong enough to properly dissolve the nutritious portions of the food. This reasoning will apply, at least with partial force, to poultry. Their digestive powers are very strong, but this is no reason why they should be employed at a disadvantage.—*Poultry Journal.*

The Dairy.

A Good Cow.

Long in the face, she's fine in the horn,
Quickly gets fat without cake or corn;
Clean in the jaws and full in the chine,
Heavy in flank and wide in loin.

Broad in the ribs and long in the rump,
Straight and flat-backed, without e'en a bump;
Wide in the hips and calm in the eyes,
Fine in the shoulders and thin in the thighs,

Light in the neck and small in the tail,
Wide in the breast and will fill the milk-pail;
Fine of the bone and silky of skin,
Airy without, a meat market within.

DAIRYING IN CALIFORNIA.

Among the Dairies at Point Reyes.

It is of the butter dairies at Point Reyes that I intend to write, and as 750,000 pounds of butter are every year shipped to market from there, it is surely a point worthy of notice. An hour's ride by steamer from San Francisco to San Quentin, and thence two hours in the narrow gauge cars of the North Pacific Coast R. R. brings one to Olema. Here I met Mr. Wm. Evans, the gentlemanly superintendent in charge of the enormous ranches belonging to Charles Webb Howard, Esq., and the estate of Judge Shafter. These ranches aggregate nearly 70,000 acres, and there are at present nearly 3,000 cows upon them. I rode with Mr. Evans two full days, spending the time in visiting the dairies on one part of Mr. Howard's place. Of these there are nine, with from 150 to 250 cows on each. Butter is made exclusively at all these dairies, excepting one, where butter and skimmed cheese are made. Better-conducted butter dairies than some of them it would be difficult to find in California, or anywhere else. The land is rolling and hilly, rising to mountains in places. The herbage seems well adapted to produce good milk, while the ocean breezes that blow almost every day give a temperature admirable adapted for butter making. Gradually the land is being seeded to the best grasses adapted to that locality, and I was shown several enormous iron cases filled with Australian rye grass seed, imported by Mr. Howard. Mr. Evans has been watching the experiment of introducing this grass for two or three years, and is very enthusiastic in its praise.

The general arrangement of the dairy houses and the apparatus used in the same in all but one of the dairies, and the form of molding the butter into two-pound rolls, is alike in all. The butter-worked used is the best one I have ever seen. It consists of a circular board, about four feet in diameter, raised about two feet from the floor, and having a deep groove cut near its edge, with an outlet at a point on the board slightly lower than any other point. About four inches above is another circular board, some six inches less in diameter than the lower one. This upper board revolves, and upon it the butter is worked, the butter-milk and brine dropping to the lower board, and thence away. The lever of paddle used is flat and not heavy. Milk is set in pans; the various milk rooms having a capacity of 900 to 1,300 pans. In skimming, the edge of the cream is loosened with a blade of horn or wood, the pan tilted a little and the cream poured off. In most dairies the cream is kept one day before churning, and is worked, salted and molded the same day it is churned; the bleached cotton wrapping for each roll of butter being put on one day later. No coloring is used, though it would at times be an advantage to use a little, in my judgment. When market prices are satisfactory, the butter is shipped twice a week by rail or by schooner, being packed in flat boxes holding about sixty rolls. The Point Reyes dairymen are now packing their butter to hold until autumn. The rolls are placed perpendicularly in barrels, and a clear brine poured in until the cask is full.

I question the wisdom of all the dairymen in California running in one rut as to style and form of putting up their butter, simply because their commission men tell them that the market will take nothing but two-pound rolls. I hear of no gilt-edge dairies—of none who are able to command a fancy price—and until some of them get out of this rut of universal uniformity of form and package, I shall not expect to hear of any. Most of the butter which I saw at Point Reyes was very good indeed; some of it was of superb quality, having solidity, perfection of grain, and a fragrance and aroma that left nothing to be desired.

Among the very choicest dairies was that of Mr. T. B. Crandell, who milks 250 cows, and gives his own personal attention to the management of the affairs of his ranch. He has been a long time resident on Point Reyes, and is one of the most intelligent agriculturists whom I have met in this State. Mr. Henry Claussen, a Swedish gentleman, rents two of Mr. Howard's ranches and dairies, keeping on one 200 cows, and on the other about 180. At one of these dairies Mr. C. has taken a "new departure," for the Pacific Coast. He discards the use of pans, and although he has a very inadequate supply of water, yet he puts the milk into large and deep cans, which are placed at once in the tank of water.

These cans are 20 inches in diameter by 22 inches deep, the bottom being raised about three inches above the lower edge of the sides, with several large holes through this lower projecting edge, to admit of the passage of air or water underneath.

As in all the other dairies where the common pans are used, Mr. C. skims these pans after 36 hours, and he is convinced that he gets fully as much butter as he does at the other dairy which he controls. I regret that he has not made some exact and careful experiments by way of arriving at more exact data. As soon as skimmed, this milk, now 36 hours' old, is at once put into the cheese vat, and the temperature raised to 82° or 84°, when the coloring, rennet and the buttermilk, are added, and the milk covered for forty minutes. The curd is then cut pretty fine, but no farther heat is added. While the curd is still in a soft state, the vat is tilted and the whey slowly drawn off. As the curd hardens a little, it is dipped out, salted at the rate of two pounds per hundred pounds of cheese, ground and put to press. For such cheese, (and one that I tasted, which was three weeks old, was really a good skimmed cheese,) when only ten days old, Mr. Claussen readily gets nine cents per pound in San Francisco.

When Mr. Claussen ventured to try this system of dairying, he was laught at by many of his Point Reyes neighbors, but with such results following the effort it is my opinion that he can stand it. The cheeses are 14 inches in diameter, flat, and weigh about 25 pounds each. In February last Mr. Claussen made the following test: From milk by deep-setting, with water at 55° Fah., 26 pounds of such milk gave one pound of butter and one and eight-tenths pounds of skim cheese.

The same day and date, 25½ pounds of milk, shallow-setting, gave one pound of butter. The milk was sour at skimming and fit only for hogs.

Of course, as the season advances and the grasses mature, the yield of butter to the given quantity of milk will be greater, and there will also be a greater amount of cheese.

On his ranch of 200 cows, where butter alone is made, Mr. C. made and sold last year 33,000 pounds of butter. After making a fair allowance for poor and dry cows, and the milk, cream and butter consumed by a family of fifteen persons or more, we have an average of at least 175 pounds of butter per year for each cow. From his other ranch, of less than 200 cows, Mr. C. last year sold 31,000 pounds of butter, and 45,000 pounds of cheese, while the sales of pork from both places amounted to $2,300, which sum he expects to exceed considerably this year.

Mr. Crandell last year marketed 42,000 pounds of butter from 250 cows, and was making 200 pounds daily when I was there, from 217 cows, all told.

Mr. Evans marketed, in 1875, 31,000 pounds of butter from 161 cows.

In some tests recently made, 22 pounds of milk produced a pound of butter. The cows are mostly Shorthorn crossed with Ayrshire, with some Devons. In some of the dairies selected cows in flush of feed have yielded daily 54 pounds of milk.

On the whole, this is doubtless one of the finest and best systematized of the large ranches or farms in our country. Mr. Howard owns the land and buildings, with their fixtures and the cows, receiving a yearly ren of $27 50 per cow for the use of the ranches.—*Gardner B. Weeks, in Country Gentleman.*

Relative Cost of Butter and Beef. Did it ever occur to any of your readers that it takes more feed to make a pound of beef than a pound of butter? A good cow, well cared for, will make 200 pounds of butter in a season, worth from $60 to $70; but a dry cow with the same feed will not gain as much in weight in the same time, nor will she be worth as much as the butter from the dairy cow, and the milch cow is left. An acquaintance of mine is fattening an ox, and in sixty days he had fed him 600 pounds of meal, at a cost of $15, with only 100 pounds gain in weight.—*Ex.*

Pure Water for Cattle.—Mr. X. A. Willard, in a late paper before the Connecticut Farmers' Convention, spoke as follows: Many cases of fever have been traced to the milk drawn from cows by the attendants of sick persons; also the impure water with which milk pans were washed. Cows that drink impure water give unwholesome milk.

Educational.

A Country School.

Pretty and pale and tired
  She sits in her stiff-back chair,
While the blazing summer sun
  Shines in on her soft brown hair;
And the tiny brook without,
  That she heard through the open door,
Mocks with its murmur cool
  Hard bench and dusty floor.

It seems such an endless round—
  Grammar and A, B, C;
The blackboard and the sums;
  The stupid geography;
When from teacher to little Jem
  Not one of them cares a straw,
Whether "John" is in any "case,"
  Or Kansas in Omaha.

But Jemmy's bare brown feet
  Are aching to wade in the stream,
Where the trout to his luring bait
  Shall leap with a quick, bright gleam:
And his teacher's blue eyes stray
  To the flowers on the desk hard by,
Till her thoughts are following her eyes
  With a half-unconscious sigh.

Her heart outruns the clock
  As she smells their faint sweet scent:
But when have time and heart
  Their measure in unison blent?
For time will haste or lag,
  Like your shadow on the grass,
That lingers far behind,
  Or flies when you fain would pass.

Have patience, restless Jem,
  The stream and the fish will wait:
And patience, tired blue eyes—
  Down the winding road by the gate,
Under the willow shade,
  Stands some one with fresher flowers:
So turn to your books again,
  And keep love for the after hours.

THE SUBJECT OF EDUCATION.

THE subject of education is a pretty broad one. Webster says "Education is properly *to draw forth*, and implies not so much the communication of knowledge as the discipline of the intellect, the establishment of principles, and the regulation of the heart." The acquiring of *knowledge* with the requisite *skill* to make the best use of it, would be our definition of education. The one is quite as essential as the other, and either alone is incomplete, while both together make a real education of practical utility.

A practical education must train as well as develop the powers. The mind must be enlightened, and the hands be able to do its bidding. It is more essential, in dealing with the materials of earth with which we are brought into contact, and from which everything that supports life and makes it endurable is obtained with labor—it is more essential that the ability to labor dexterously is acquired than that we gain theoretical instruction without the power to use what we know. He is educated the best who can, other things being equal, accomplish the most with a given amount of strength, in a given amount of time, in whatever direction he devotes his energies. This is as true from an intellectual and moral as from a material standpoint.

As our civilization advances, science and inventions increase, and as moral refinement progress the utility of things will be more and more regarded, and the necessity for being practical will become more and more apparent.

Practicality neither smothers nor blunts the finer sentiments and feelings. It is the true foundation, without which a proper realization of noblest enjoyments is impossible. And when it comes to gaining a living in competition with the greed of the world as it is in this, its infancy of civilization, to be well informed and capable is certainly quite essential to one not made independent by the material aequirement of others.

In contrast with an education for usefulness—the education of body and mind and heart to such labor as will bring competence while doing good—is another species now quite popular. It is the idea of an education that will get a living without working for it, or making fair returns in usefulness to the community for what is gained from it. This is what some call "being smart," which means living off what othera produce. Our common school teachers are, too often, imbued with the idea, and instill it into the heads of their pupils, that to get an education so as to live without work is *smart*. While nearly every institute of a private character impresses the pupils with the importance of education as a means of acquiring wealth without labor.

Our large cities are filled with young men of this class, who think it not honorable to do manual labor, and who are incompetent, even if they desired to work with their hands. They are waiting for some position as clerk in store or office. And when it comes to offices, what kind of men do we find there? and what are they doing? Nine-tenths of them are engaged in some schemes or speculations which could be dispensed with with benefit to the community. Their inventive talents are used to contrive new ways for acquiring the productions of others; any way to get money. Without adding any real value to anything, they manage to manipulate business between man and man, and pass it through their hands, taking liberal toll for their "service." Their coostant study is now to take advantage of others' necessities, and to absorb their substance. Look at insurance agents, real estate agents, stock brokers of every class, sewing machine agents, lawyers who make laws to feather their own nests from others' chickens, and, in fact, the whole class of manipulators of so-called "business" wherein men who labor have to hold intercourse with each other. On this Coast, the mining business has given a great opportunity for getting money out of the people. The *share* business takes more money on the outside than the mines pay on the inside, the most of which goes to enrich a set of sharpers who are educated to get a living without working for it.

Horace Greeley once said that he who gets money without squarely earning it steals it. How many thieves are being prepared in all of our schools at this rate?

The remedy for this condition of things lies largely in the direction of industrial schools—schools where a technical education can be acquired—where pupils are educated for usefulness, instead of uselessness—where the use of tools and *how to do honest work* and excel in the accomplishment of skillful labor is made a specialty. And *at home* parents should aim to instill into the minds of their children, upon the platform of honesty and moral and religious principle, the ennobling idea that labor is honorable; that to be useful to the world is of more importance than being rich, and that honorable riches can be gained through superior understanding of how to take advantage of material resources in an honest manner, while pursuing an honorable avocation and living a happy and useful life.

Children on the Farm.—Children on the farm are better off than children in towns and cities. It is almost impossible to raise good children in town. They will fall in with bad associates and become more or less contaminated. They never make the distinguished men that country boys do. There are too many attractions and pleasures to become fascinated with, and they think of these instead of good books and of growth in knowledge and virtue. We grew up on a farm and are glad that that was our fate. We had to work hard, and thought our lot was a hard one, but now know it was the best thing that could have befallen us—better than an inheritance of riches. The only pleasures within reach, good books afforded; and we read and reread every book in our district school library, and the knowledge gained has clung to us ever since. Then, farm life has good influences on children. We recollect vividly the pleasures afforded in our youthful days, by the announcement of a colt, or a calf, or a lamb, or of a brood of pigs. Farmers' children can appreciate the pleasures such announcement make in one's younger days. And the the influence of petting and kindly treating all kinds of stock, is a good influence. But this is not confined to kindly treating stock alone. It extends to the care of trees—planting and nursing them kindly—and flowers, and garden vegetables, and everything of the kind. We have noticed, too, that when farmers' boys go off to school, to the academy, or college, they are more laborious, and thorough, and practical than town boys; but when they enter into business pursuits, the difference is still more observable.

Root Up the Weeds.—Two boys, Jim and Will, were employed by a gentleman to keep the paths of his garden weeded. Jim contented himself with taking off the tops of the weeds. He soon cried out, "I've cleared my path," and having swept away the leaves he went off to play.

Will was much longer at work, for he stopped to take up all the weeds by the roots, and he was well tired when he went home.

But the rain came down in the night and all the next day, and when the boys' father went, a few days after, to look at the two paths, Jim's wanted weeding as much as at first, while Will's was clear and only needed a few turns of the roller to make it quite neat. So Jim was sent back to do his work properly; and very tired he would have been had not Will good-naturedly helped him to finish his task.

Only thorough work is worth doing. Faults only half uprooted will appear again and again, and we shall almost despair of curing them. Will you remember this?—*Bright Side.*

AGRICULTURAL READING.—We ought to encourage practical agricultural reading. It is not claimed that these helps can, of themselves, make skillful agriculturists, but to a working man, readey to learn, they are suggestive. To an enquiring mind, at an impressive moment, they may do great good. I do not remember ever to have seen the subject put in a stronger light than in the following conversation, read in an agricultural paper some time ago:

A practical, hard-working, thriving farmer, relating his experience and trials, entered into the minute details of his careful and original experiments—his unwearied patience, and sometimes growing eloquent over his final brilliant victories. His knowledge could not be written by men who know nothing about farming. Said a quiet friend, "Well, neighbor, if all this valuable information, the result of years of observation and labor, were written out in full and published, which would you have a young man, in whom you felt sincere interest, do—take this as he finds it from your pen, or go through the same vexation, labor and losses that you had to get it?" The question puzzled him, and after a moment's silence, he yielded gracefully that real practical writing could do great good.—*Ex.*

WHAT SMOKING DOES FOR THE BOYS. A certain doctor, struck with the large number of boys under fifteen years of age whom he observed smoking, was led to inquire into the effect the habit had upon the general health. He took for his purpose thirty-eight boys, aged from nine to fifteen, and carefully examined them. In twenty-seven of them he discovered injurious traces of the habit. In twenty-two there were various disorders of the circulation and digestion, palpitation of the heart, and a more or less marked taste for strong drink. In twelve there was frequent bleeding of the nose, ten had disturbed sleep, twelve had slight ulceration of the mucus membrane of the mouth, which disappeared on ceasing from the use of tobacco for some days. The doctor treated them all for weakness, but with little effect until the smoking was discontinued, when health and strength were soon restored. These facts are given on the authority of the *British Medical Journal.*

FOR FARMERS, the country wants the most energetic, thorough-going and wide-awake boys and young men that can be found. Hence, if a boy is blessed with that crowning concomitant which moves the world—brains—let him become a farmer. Brains constitute the great desideratum in agricultural science at the present day. Fifty years ago muscle was the essential requisite. Fifty years ago a farmer was expected to perform every manual labor of the farm by the exercise of muscular force, while at the present day he needs more than muscle to enable him to manage labor-saving tools with skill and efficiency. When the labors of the farm were nearly all performed by the laborious and fatiguing application of human force, farming was irksome drudgery. But now, when teams and steam power respond to the bidding of the tiller of the soil, agriculture is the most agreeable livelihood that one can desire.

THE BASIS OF OUR CIVILIZATION is labor fairly rewarded. By this I mean that the great body of our people are compelled to toil with their hands, and rates of wages prevail under which they can rear families. The day laborer as well as the skilled artisan can generally send his children to the common school a few years, and the elements of education there received cultivate self-respect in parents and children. These schools are the nurseries in which citizens are grown. The immigrants from European countries generally avail themselves of their privileges. The native-born children of our adopted citizens are genuine Americans. Shall we encourage the immigration, nay, the importation of Chinese, who rear no families, have not half the wants of others, and can therefore work for half the prevailing wages? Every Chinaman who comes displaces one of our own laborers. Is it a good exchange? If the sole object of civilization were to enable the wealthy to accumulate more wealth, regardless of the comfort and cultivation of the common people, I should still doubt that wealth itself could afford to destroy the character of the nation in its greed for increase. If capital could avail itself of Chinese labor exclusively at half price, the impoverishment and final extinction of the great middle class of our country would leave a nation of lords and serfs, in which property itself would be a sort of adversity.

> *—Extract from Senator Sargent's Chinese Speech.*

GOOD ADVICE.—Think for yourself and think much more than you talk.

Be proud of your calling; if a shoemaker, strive to make a better shoe than anybody.

Look well to the ways of your footsteps; never let one be inside a bar-room or gaming saloon.

With a clear eye and an upright heart resist every wrong.

"If thou hast a truth to utter, speak and leave the rest to God."

Touch not, tastenot that which will corrupt.

Go not to your grave one-third whiskey, one-third tobacco, and the other third a composition of corruption so filthy that grave worms will shun the place where you sleep.

Be something—be somebody. Set your mark high in the world and then move towards it.

Don't wait for somebody to lift you up to the place you aspire—lift yourself.

"Act; act in the living present, heart within and God o'erhead.

HOW TO MAKE A NICE GIRL.—First get your girl. (N. B.—She mustn't be an old girl, but a young one, nice and tender,) Bring her up from early infancy on a strict diet of hot pickles, cold brandy-and-water, and Ouida's novels. Send her to a fashionable boarding school "to be "finished off;" and, when she comes home for the holidays, carefully develop her latent love for dress, extravagant habits and fondness for flirtations. Buy her the Slang Dictionary, and let her go anywhere and do everything she likes. By the time she is twenty-one she will be quite a nice girl.—*Punch.*

BOYS, NOTE THIS.—Don't forget to take off your hat when you enter the house. Gentlemen never keep their hats on in the presence of ladies, and if you always take yours off when mamma and the girls are by, you will not forget yourself or be mortified when a guest or a stranger happen to be in the parlor. Habit is stronger than anything else, and you will always find that the easiest way to make sure of doing right on all occasions is to get into the habit of doing right. Good manners cannot be put on at a moment's warning.

VULGARITY.—We have a friend that never speaks a "vulgar word." He is a minister and a writer of ability. "I resolved when I was a child," said he, "never to use a word which I could not pronounce before my mother without offending her." He kept his promise. He is a pure-minded, noble, honored man to-day. His rule and example are worthy of immitation.

Boys readily learn a class of low, vulgar words and expressions which are never heard in respectable circles. The utmost care on the part of parents will scarcely prevent it. Of course, we cannot think of girls as being so much exposed to this peril. We cannot imagine a decent girl using words which she would not give utterance to before her father and mother.

Such vulgarity is thought by some boys to be "smart," "the next thing to swearing," and yet not so wicked. It becomes a habit; it leads to profanity; it fills the mind with evil thoughts; it vulgarizes and degrades the soul; it prepares the way for many of the gross and fearful sins which now corrupt society.

Dear young reader, set a watch upon the door of your lips; keep your mouth free from all impurity.

Women.

Scientific Courtship.

Young Molly met Christopher down by the farm
With his analysis
And his catalysis
And his dialysis
What would he do there?
He came down to woo there,
He came down to sue there,
To bill and to coo there,
Not to fill her soul with alarm.

Oh! Science, 'tis thus that fair made you win.
With parthenogenesis
And alterogenesis
And heterogensis
And other such things;
For Love he has wings
And with him he brings
Full many such things
In the ears of fair maidens to din.

Young Christopher came with his finest brochures
On trilobates
And troglodytes
And such delights,
And he said, My dear, these are yours,
Yes, they're yours,
Love may come and love may go,
Science endures.

The heart is a stubborn thing,
Anc conical in shape;
A remnant which with us we bring
From our ancestral ape.
It drives the blood to Molly's cheeks,
She opens her ruby lips and speaks;
Her mitral valve plays
In the wildest of ways,
Her columns arena
Gives her an idea
By the way that it acts;
And accepting the facts,
She then and there agrees to become
The partner of his scientific home.
—(Journal of Applied Chemistry.

"As Sixteen to Twenty-six."

I THANK you, Dr. Draper, for furnishing me a text. Dr. John Wm. Draper says, "The strength of the female is to that of the male as 16 to 26."

About three-fifths, then, is the fraction. Who would guess it?

Last summer I wandered out to a Ligonier farm-house for a brief visit. Remaining over night, I was aroused in the morning at a dreadful hour—four o'clock, I think—by the busy rattle, clatter and hum of a new day dawning in the kitchen.

I thought unutterable things, and went to sleep. At seven I was awakened "for all day" by the rising bell. In due time I found myself sitting at table. In a few minutes in sauntered the nominal head of the house, a great, stalwart man, the picture of health. "Wife, have you any breakfast for me?" he asked in a good-natured way, so *very* good-natured that I instantly surmised that he had already been well fed, and only came now for a cup of coffee and a chat.

"Oh, yes, dear," the little wife said; and she hurried to set a chair for him, and to put cup, plate, etc., on the table.

"Why, how's this?" I asked; "I had thought the family day commenced a little after midnight!"

"Yes," said the wife, "he has had one breakfast; he can't work before breakfast."

"No, I can't work before breakfast no. how! Have to have my breakfast before I can do anything," the husband asserted, with great apparent self-respect for that very circumstance.

I said, with a somewhat nettled feeling, which, of course, I could not exhibit, "And can *you* work before breakfast, Mrs. Clark?"

"Oh, my! I have to be up and over the stove, cooking meat and potatoes by four, every morning."

The little woman had a great "stirrin" baby—as they call them out here—and to my certain knowledge he had sung several "Songs in the Night" just past; I knew the mother's sleep had been fragmentary, at best; I know she was never thoroughly rested from one day to another; but she could, all the Summer long, get up before the light and "work before breakfast" to prepare a hearty meal for that weaker vessel who "couldn't work before breakfast." Neither husband nor wife seemed to think the eternal fitness of things was disturbed in the least by this little arrangement.

Item. Since then I have been trying to mature a plan by which everybody can have rolls and coffee before rising. Can't make it out except by an alcohol boiler, and probably nine out of ten will blow themselves up with that, to say nothing of setting the bed-clothes on fire.

Sudden second thought—marvelous it didn't occur before!—servant, or wife, whichever you happen to have, can get along somehow without the coffee, and take her "roll" out of bed—to get yours ready! (Patent.)

Because, "the strength of the woman," etc.

But there be men and men.

Once I went to visit a former schoolmate who had been many years married to a good man, who owed his superior wit, moral worth, right ideas to his mother. He was an Aunherst graduate, a cultured gentleman, a Congregational minister, the preceptor of an acadamy, and, last and least, but not little, an exceedingly handsome man. Just think of it, he was not spoiled a particle! They lived in their own commodious house, this childless couple, keeping a servant, when a good one was to be had; going without at other times.

It happened to be there at one of the other times—and was glad of it—for it developed this astounding fact that George really believed he was stronger than Lizzie; practically believed it to the extent of getting up and making the fire, and assisting about breakfast with all the vigor and energy expected from a hired girl at a dollar and fifty cents a week!

It was pleasant to see and to remember how this lively, cheerful, efficient and versatile professor "snapped around," setting the table, going down cellar for bread, running out with white pitcher to the milkman's cart, and after meals—*that's* the tug of war—actually drying the dishes, in a handy "26" manner, to the

tune of "16's" washing. And other things to match.

At nine o'clock George was off to his school; at eleven Mrs. George went down and conducted several English recitations, and could have dropped into Latin without a struggle or a groan.

"Well, what of it?" mutters some disaffected interrogation point.

Oh, nothing. Only I thought I'd tell you; for "woman's strength is to man's as 16 to 26;" and a good man in a house is a well-spring of pleasure.

I used to know another man, a shoemaker. He was six feet high, broad-shouldered, and apparently robust.

But he had an "inward weakness," located mostly in his will; it was one of the queerest ills that flesh is heir to. It would sometimes seize him as he sat working at a child's shoe, and so feeble did he become that he just had strength to grasp his rifle in a convulsive sort of way, rush from the shop, tramp over the mountain till sundown, and then toil home with two grey squirrels and a robin red-breast—for man's strength is as 26, you know.

His wife, meanwhile, did all her own housework, reared two great strapping boys, took in sewing, stitched boots, and amused herself in the intervals of these light, graceful employments by quietly enduring a tyrant rheumatism which, for weeks at a time, obliged her to go around her house "on all fours," to attend to her duties; and woman's strength is but 16! Eh, Dr. Draper?

A word, in closing, to John William Draper, M.D., LL.D. In his "Text Book on Physiology for the Use of Schools and Colleges," p. 363, he enumerates several mental and moral differences between the sexes, and then says, "The physiologist is thus obliged to speak of the constitutional and mental imperfections of the female," etc.

Who "obliged" him? What's the use of being an "M.D., LL.D." if a man may not do as he likes? And why did not this nebulous, or fabulous, compelling influence "oblige" him to speak of certain "constitutional" and *moral* "imperfections" of the male? If woman's "less vigorous reasoning powers" are an imperfection, what shall we call man's proverbially feeble endurance of extreme pain? If woman's unbalanced judgment is an imperfection, what about man's inferior delicacy and chastity of thought and feeling? Where was the justice of thus branding the sex with "imperfection?"

Was it a necessary thing, or a good thing in any event, to record such words upon the closing pages of a text book "for the use of schools and colleges?"—*J. A. W., in Science of Health.*

Things I Like To See.—A working man reading the newspaper; a real lady who can carry a parcel; a father at a place of amusement with his children; a young man with a clear eye, and a fresh, virtuous, unhackneyed face; a shop-girl neatly dressed, and without sham ornaments; a man of business going home at night with a bouquet for his wife; a shopkeeper civil to and patient with a poor woman, who, with a baby across her arm, ventures to buy a one shilling article; a dressmaker who is scientific enough to perfect a "fit," and yet leave your breathing apparatus in Christian-working condition; a shop that is not an emporium; a a milliner who don't come from Paris; a jolly domestic who likes "the family;" a bride with her pet small house; a young father with his first boy.—*Fanny Fern.*

A good wife is a good thing, but a bad husband beats her.

Domestic.

FAMILIAR TALKS---No. 12.

BY SNIP.

A YEAR ago I sent my first letter to the Agriculturist, and having been encouraged by seeing every article, good, bad or indifferent, in the paper, feel like trying to induce others to write occasionally. There is not a housekeeper but could write something. A receipt, a suggestion for the house, the dairy or the garden, an experiment tried—it may be just what some one is looking for. Come, my dear sister housekeepers, write and make *our* paper the most welcome visitor —one that cannot come too often.

PICKLED MEAT.

Here is a receipt for making a palatable dish of cold meat. After taking all the meat that can be nicely sliced from a boiled ham, chop the remainder fine as possible, season with pepper and cloves, put in a jar or bowl and cover an inch deep with vinegar. I use other meat in this way, but found the proportion of vinegar was too much to suit my taste. Let it stand a day or two.

APPLES AND CREAM.

Here is another which I am sure is good, though I have not tried it. Take good cooking apples, cut in halves, and bake till well done. (Remove the cores before baking.) Then put them in a deep dish, large enough to allow them to lie only one deep. Sprinkle sugar over them, pour on thick cream till it comes up on the sides of the apples, and eat when about half cold. The old rule was to bake only sweet apples, but I discarded that plan several years ago, and use those that are good for sauce. One member of our family wants the core cut out, the cavity filled with butter and sugar, and then bake the apples. He says they are excellent but my opinion is just the opposite.

HANDY PIECE BAG.

Here is something for the fancy-work corner that "Busy Bee" spoke of a month or two ago. Hardly that either, for it is useful rather than ornamental. Take a piece of cloth about three-fourths of a yard long, and about half a yard wide. Another piece as long but only half as wide. Hem one edge of each the longest way. Then lay the narrow piece on the wide one, keeping the right sides toward you. Baste the raw edges together, and sew the narrow piece to the other in three places so there will be four equal divisions when the ends are sewed together. When this is done, gather the two edges that are basted together. and sew on to a circular piece of cloth. Run a tape through the hem of the wide piece and you will have what was originally intended for a shoe and stocking bag. I use mine for patches, braids, worsteds and such stuff, and keep patterns in the central part.

Perhaps a hint in regard to these patterns will not be amiss. I write the name on a strip of white muslin, roll the pattern up snugly, and tie the strip around it so that the name can be seen at a glance.

BEST FOOD.

A correspondent asks this question of the "Editor of the Health Department:"

"Please give us your idea of the proper food necessary to obtain the highest mental achievements. The friend for whom I ask has recently lost, in a dearly loved husband, the only friend on earth who can thoroughly understand and appreciate her. She desires to fulfill her mission upon earth, and to live healthfully; has no little ones to absorb her time and thoughts, and resolves to devote her life henceforth to humanity. The whole world is her family, and for its welfare she is willing to make personal sacrifices."

As there is but one editor to this paper at present, we suppose it must mean *us*. Now, we do not claim to know quite everything, and have no particular hobby to ventilate on this subject. In feeding animals we should very largely consult the appetite of the beast, believing that in a healthy condition it would be an infallible guide. Even in disease, we believe the appetite often craves that food which is best. With everything good before it, the animal will eat that which its physical needs require. The same may be said of plants. Placed in a rich soil, the plant will absorb the elements necessary to its growth, and the better it is fed the better it will grow and develop.

This is getting right down to the root of the matter. There is within every being, whether plant, animal, or the higher man, an instinct superior to any amount of reason, which, if not abused, will never lead us far out of the way in matters of diet. Our civilization has invented a thousand devices and compounds for depraving the appetites of men and animals, especially of men. And to know *what to avoid* requires a good deal of practical experience, observation, scientific knowledge and reason. On general principles, that food which the appetite desires, which is easily digested and assimilated, is that which the system needs, and is the best, whether it be meat, fish, fowl, vegetables, grains, or fruits, so that it is simply prepared without stimulating condiments. Each person should keep his or her stomach in such condition that it is a superior law unto itself. By never deceiving or abusing it, it will never deceive or abuse the body or the mind, but will call for that which is good and wholesome, and do its work faithfully and cheerfully. Be true to your stomach, and it will be true to you. Keep it well, and it will keep you well, and allow you to develop; in fact, will promote and sustain development.

QUESTION AND RECIPES.

BY MRS. L. W.

Lady friends of the Agriculturist, I am going to ask a question. Some may think it a simple one, but it don't seem so to me. Will some one tell me how to bake jelly cake to keep it from sticking to the tins? I think every jelly cake I make will be the last one, for I cannot get them off, only in pieces. In return I will give "Snip" a recipe for making pickles, and tell "Enquirer" how to make mushroom catsup.

CUCUMBER PICKLES.

Pick your cucumbers when from three to four inches long; wipe them with a coarse towel (don't wet them); after wiping put them into weak salt water for twelve hours: take them out and drain until perfectly dry, then press them into glass fruit jars. To each quart of vinegar add one pound of brown sugar with mustard seed, grain pepper, cinnamon and cloves to suit the taste; boil and skim well, then pour it over the pickles boiling hot, being very careful to leave the cucumbers covered with the vinegar; seal them up same as canned fruit.

MUSHROOM CATSUP.

Break the mushrooms up into small pieces; but a layer of them in a jar, sprinkling salt over them alternately, until you have salted all you mushrooms; let them stand three or four days; then boil and strain, squeezing them well; then boil the liquor up with cloves, mace or any spices you prefer; when cold and clear bottle, putting in a clove of garlic or small onion and some horse-radish.

LEMON PIE.

The juce and rind of one lemon, one cup of water, one tablespoonful of cornstarch, one cup of sugar, one egg, and a piece of butter the size of a small egg for one pie. Boil the water; wet the cornstarch in a little cold water; put into the boiling water and stir until it boils up, then pour it upon the butter and sugar; after it cools add the egg and lemon; bake with an upper and lower crust.

RECIPES.

BY NELL VAN.

TO CLEAN ZINC SINKS

there is nothing superior to coal oil used by saturating a woolen cloth, with which rub the sink thoroughly until all stains and roughness are removed, after which remove the odor of coal oil by the use of hot water and soap.

[Lime makes an excellent polish for zinc.—Ed.]

TO PRESERVE SAUSAGE.

When the meat has been nicely ground and seasoned, make it into small, flat cakes; place them in a frying pan and cook until about half done, (this is for the purpose of making them hold together,) then pack them closely in five-pound tin cans, and pour over fresh lard until filled. Sausage put up in this way will keep perfectly sweet and fresh for three or four months.

Household Reading.

A Deed and a Word.

A little spring hath lost its way
Amid the grass and fern;
A passing stranger scooped a well,
Where weary men might turn,
He walled it in, and hung with care
A ladle at the brink;
He thought not of the deed he did,
But judged that toil might drink.
He passed again, and lo! the well,
By summer never dried,
Has cooled ten thousand parched tongues,
And saved a life beside.

A nameless man, amid a crowd
That thronged the daily mart,
Let fall a word of hope and love,
Unstudied from the heart;
A whisper on the tumult thrown,
A transitory breath;
It raised a brother from the dust,
It saved a soul from death.
O germ! O fount! O word of love!
O thought at random cast!
Ye were but little at the first,
But mighty at the last!

FASHION.

BY REPORTER.

WHILE walking the street a few days since, my attention was attracted to a young lady on the other side, who, having her hands encumbered with books, basket and umbrella, was apparently hesitating whether to cross or not. She looked behind her, then at the mud. Her features wore a look of utter despair; yet she hesitated but for a moment, then stepped boldly out into the slush and mud; and —O, my! Training? Yes, trailing after her an

enormous amount of dress-goods. Again she hesitated a moment at a little puddle, then stepped *into*, instead or over it.

I thought, "Why does she this?" Another glance, and the question was answered. She was dressed in accordance with the edicts of Fashion.

As she passed me, I stole another glance, with this result: I saw a large, well-formed head, a full, round forehead, showing a large and active brain, smooth, even features, and the general appearance of a student. Yet, with these natural gifts and educational advantages, she was a slave! Why was it?

With this question haunting my mind, I sought an interview with the Empress of Fashion herself. Passing over the introduction and little preliminary remarks incidental to such a call, I will simply say, I found her genial and obliging, apparently quite willing to answer my questions. I give our conversation in full.

Reporter—What is the extent of your domains?

Fashion—My domain is the whole earth—the land and the seas alike;—or, as you Americans say, "there is no north, no south, no east, no west." Wherever man is, there are my agents.

R.—What is your power or authority?

F.—My power is absolute. There is no higher authority—no court of appeal. Some one has said: "Better be dead than out of fashion,"—using my name figuratively. This is now generally believed, for the results of failing to comply with my commands are too well understood and dreaded.

R.—Who are your subjects?

F.—All mankind, without regard to rank or station. The savage Indian builds his wigwam, paints his body and scalps his victims in accordance with my commands, The millionaire erects his mansion, clothes his person and gives to the poor by the same authority. The heathen and the Christian alike look to me for models of architecture for temples to their gods.

R.—Does civilization detract from your powers?

F.—Oh, no; it rather adds to it; for, as civilization advances, wealth increases; and this gives me the key to these, the civilized colonies: they require variety, and it is through their wealth that I am enabled to give it to them. It is with these colonies that I take my greatest pleasure. I delight in varying their dress. The styles of yesterday passed with the day. The pull-back dress and spring-bottom pants, the one-sided hat and long-toed boots I shall soon throw away, and so on throughout time.

After the fair lady had given me her opinion of the effect of her rule, I bade her adieu, my mind filled with many subjects for reflection, which I intended to have included in this article, but it is now much beyond the desired length, so I will leave you to draw your own conclusions.

POPULARITY.

BY NEMO.

This, that and the other matter are often said to be unpopular. In the same sense, this, that and the other individual are often said to be unpopular. And, pray, what is popularity? A mere bubble, unless it is used as an influence for some personal ends.

It often happens that the most unpopular individual leaves a valued record. The world, though progressive on the whole, does not show its progress in the footprints of individuals. Nevertheless, individuals are the landmarks, the guiding spirits through which progress is developed.

Truth, in its march, has many obstacles to encounter; but it is a kind of positive element that supersedes and displaces error, so sure as truth is good and error is bad. It is only a question of time.

The firm individual, who plants himself on the ramparts to do battle for principle, who has no compromises to make with wrong, is goaded and maimed at every turn, till truth forces itself uppermost.

The most popular class in the world are those who, though they may have opinions of their own, are governed more by circumstances than by their opinions—more by policy than by principle. Hence, the individual of positive and affirmative character has no negative principles. In God, or truth, or principle he trusts. To him

An approving smile from the wise and good
Is preferred to the shout of the multitude.

He does not seek the honors and emoluments of the world at the expense of his own individuality and his own manhood. Not being dependent on others for his thoughts, he is independent in his mode of reasoning. As he reflects his own thoughts in his own language, how *not* to say things is one of the fine arts to which he lays no claim; and he often says things too blunt for the undecided, and too unpopular for the equivocating or negative mind. Therefore, as a reward for the personal sacrifices he is always making, he trusts to time to vindicate him. His reward seldom comes to himself personally; but, like the great American statesman, Henry Clay, he feels that "he would rather be right than to be President." But what kind of phrenological organization does it take to make the popular man of the world? The question needs no answer.

MORE THAN ONE WOMAN IN THE HOUSE.

GRANDMOTHER'S ADVCE.

There should be two women in every house, especially the farm house. We do not mean by this, gentlemen, that every man should have two wives. Oh, no! But we do mean that friend, mother, sister, aunt, grandmother—somebody—should be companionship for the main housekeeper.

We will take the case of a family consisting of six members—father, mother, and four children ranging from one to ten years. They live on a grain fraim. The children are not old enough to do farm labor, therefore help must be employed—from one to three men—making from seven to nine in family.

How much of sunshine and free air may we conclude this housekeeper enjoys? How much time among the flowers? How much time to read and keep posted, so that when company calls she can converse with her husband and them on the various topics of the day? How much time to call out the minds of her children, and instruct them as only a mother can? Perhaps an hour or two on Sunday, provided that then there are only two meals.

How different would it be if only some one were with her, to change work with her and allow her to work among the flowers now and then by way of change, or spend a half hour in the poultry yard among the young broods, or in company with the children to go and gather bouquets of wild flowers by way of diversion—anything to permit the mother now and then to relax her nerves, to throw off restraint, and yet feel that the wheels of the household are not clogged the moment her hands cease to labor. Oh! if *men* only knew how much of sunshine they shut out of their own presence, out of their own domain, by having a weary, tired companion about them, instead of one able to give off vitality to husband and children!

But vitality cannot be manufactured and cheerfully maintained without the presence of certain elements. Fresh air, sunshine, cheerfulness and rest from care are Nature's great restorers. While nine-tenths of the farmers' wives have been, and are to-day, using up not only all their natural strength, but using additional stimulus to carry on their work—instead of enjoying the situation, the lovely scenery of the country, the free air, the groves and flowers—they find country life a constant wear and tear of nerve force.

I could write a book on this subject and minor ones connected with it, but will conclude by saying, See to it, O, man of the farm, that there are two women in your household, even if one should be only a Chinaman. Anything to give relief to the tired wife and mother is better than to let her wear out with hard work, anxiety and suffering. But better than a mere servant is a companionable person, a relative or friend, whose service is not only paid for but is sought after and reciprocated in kindness and mutual sympathy and human equality.

DRIFTING DOWN THE STREAM OF LIFE.

BY BLANCHE.

Down the stream of life we are drifting. Our boat at first glides smoothly along over the ripling brooklet; the shining pebbles glitter in its bed; the trees and shrubs, in their robes of green, stretch forth their moss-covered, ivy-mantled arms to shelter and protect: the merry birds twitter among the boughs, while the rising sun drapes the landscape and the stream in beauty's most adorning robes; the over-hanging branches, softly swayed by gentle zephyrs, drop their brightly-tinted blossoms, which dance and wrestle with the waves, then quickly disappear; here and there a modest lily peeps above the water's edge; all is gaiety, hope and happiness. Pure and undefiled as the flowers on the brink, we thoughtlessly sail down the stream.

The winding, rippling brooklet is changing; gliding away are childhood's happy hours. In youth and manhood we find ourselves in a wider, deeper stream, surrounded by objects more striking and magnificent—by dashing waves, whistling winds, tumult and confusion. One moment we are in fancied security, the next, in the greatest danger; for a while elated by success, then depressed and miserable with disappointment. When shipwrecked, we strive in vain to anchor;—our voyage may be hastened—it cannot be delayed. Time, the stern boatman, has unfurled the sail, and on we are borne, our joys and our griefs alike left behind. Too soon we feel the chill of winter, and snow-flakes may be seen falling on the golden hair. Wave-tossed, weary and worn, our frail bark bears us on until we hear the rushing tide, are launched into the ocean, and wafted over the crested waves to the "better shore of the spirit land," just as the setting sun of our life-day sinks to rest beneath the waves, painting with its gorgeous tints landscape, sky and sea.

WHAT MEN NEED WIVES FOR.—It is not to sweep the house, make the bed, darn the socks and cook the meals, chiefly, that a man wants a wife. If this is all he needs, hired help can do it cheaper than a wife. If this is all, when a young man calls to see a lady, send him into the pantry to taste the bread and cake she has made; then send him in to inspect the needlework and bed-making, or put a broom in the young lady's hand and send him to witness its use. Such things are important, and the wise young man will quickly look after them; but what the true man wants with a wife is her companionship, sympathy and love. The way of life has many dreary places in it, and man needs a companion to go with him. A man is sometimes overtaken by misfortunes; he meets with failure and defeat; trials and temptations beset him, and he needs one to stand by and sympathize. He has some hard battles to fight with poverty, enemies and sin, and he needs a woman that, when he puts his arm around her, he feels he has something to fight for, and that she, being a true woman, will help him to fight; that she will put her lips to his ear and whisper words of counsel, and her hand to his heart and impart inspiration. All through life, through storms and sunshine, through conflict and victory, through adverse and through favoring winds, man needs a woman's love. His heart yearns for it. A sister's or a mother's love will hardly supply the need. Yet many seek for nothing further than success in housework. Justly enough, half of these get nothing more; the other half, surprised beyond measure, have gotten more than they sought. Their wives surprise them by bringing out a noble idea in marriage and disclosing a treasury of courage, sympathy and love.

Husbands and Wives.

HUSBANDS.

Appleton's Journal says: Ingratitude and indifference sometimes mar the character of men. A husband returns from his business at evening. During his absence, and throughout the live-long day, the wife has some little surprise, some unexpected pleasure, to make his home more attractive than ever. He enters, seemingly sees no more of what has been done to please him than if he were a blind man, and has nothing more to say about it than if he were dumb. Many a loving wife has borne in her heart an abiding sorrow, day after day, from causes like this, until, in process of time, the fire and enshusiasm of her original nature have burned out, and mutual indifferences spreads its pall over the household.

WIVES.

Many women have little idea of how greatly they shock the tastes and really endanger the affections of their husbands by their unseemly domestic apparel. There is not a man of sense and refined feeling anywhere who would not prefer some simple and chaste adornment for the wife in the morning to any extreme of splendor at the evening ball. Let a woman by all means dress brilliantly on those occasions that render it proper. We have no desire to abrige her privileges nor baffle her instincts in this particular; but we claim that it is important for her, if she value her household serenity, that she should give equal heed to her customary domestic attire. The female who goes about the house untidily dressed has no right to the title of woman. She is without those marks and indications by which she can be so classified.

HELP—HOUSEHOLD HELP.—Men often

fail to consider how great is the need of help for those in charge of the household. The wearied, worn wife and mother would be glad to have some one help her, if but to do some of the lighter work; but she too often finds the help hired more annoying and troublesome than would be the doing the work herself. The cry comes up continually for help, good, reliable, willing workers, who are ready and willing to take hold and work, and to learn to do what they do not now understand how to do. This cry comes from the country as well as from the towns and cities. It is not the cry of distress, coming from those sinking amid the waves of the surging sea; but it is the cry for help from those who are worn down with labor, wearied with engrossing cares and anxious waiting for a change in troublous times. It is a constant working, watching, waiting strain between *no* help and *poor* help, that is killing many a fond mother working to keep the family agoing. Will not the boys and girls, and the father too, open they eyes to these things, and turn a helping hand to lift the weight that is slowly, but all too surely, wearing away the life of her whose only object now is to sustain her husband and children?

UP-COUNTRY LETTERS---NO. 6.

BY RACHEL A. ELY.

Imagine *me*—yes, it is myself, truly—able to be nurse to one more unfortunate and ailing than I am. Even so. My hostess, out of Christian kindness (though she smilingly disavows being a Christian, but I'd like to know what it is then) undertook to help the sick woman, and finding her no worse the day following her first treatment, she again went to work, giving head and sits baths, hot packs, tepid injections to the bowels, copious water drinking, and, best of all, hope and rest. (You see I talk quite learned already, and I intend to be more learned some day.) But as it is impossible for her to be here and see that her orders are obeyed, and there is no other woman to be had for miles around, I have offered to give my little mite towards Christian aid. So my good friend comes over after her own work is done, and baby asleep for the children to watch, and gives what treatment is needed and leaves orders for what is to be done, and I can see they are executed by her oldest girl, who is a very capable child, and, like her mother, a worker. The husband, too, gives as much of his time as he can from the harvest field, doing much of the cooking (I wonder how he likes "three meals a day"),

So here I sit, watching the half-unconscious life on the bed, and think and wonder if it indeed is *I*, who only six short months ago was "waiting, only waiting" for death to relieve me of all aches and pains and set my spirit free. How long the time seemed then, while now how swift the days go by, when looking ahead to coming strength and health. You of robust body and sound head cannot understand nor sympathize with us invalids who have almost felt the icy breath and unloosed so many earth ties that life itself had lost all but the dim and far off hope that to live meant to help to make the world and its people better, if possible. Right, for right's sake, not from fear of doing wrong. And above all, have I felt how untruthful and faithless are the lives of the masses. Welladay! Let me endeavor, Oh! Wise, All Father, to be true to others and myself, if indeed my life *is* to blossom into flower on this earth. May the fruit thereof be worthy the deep soul pruning and heart culture received and endured.

If this sick woman gets well—and it may be so—I wonder what the doctor will say- and also whether the husband will be quite as generous as he thinks he will be. Half his farm is the price he declares he will give to save her. I do hope he will have the opportunity of helping these poorer neighbors, or at least speak in kindness of them and their odd ways. We will watch and wait.

AN "INGLEWOOD" SENTIMENT.

Mr. Editor: As "Aunt Mary" and friend "Inglewood" have been publishing their love letters in your interesting journal, as I suppose, for the benefit of your readers, I will ask permission to suggest a few friendly criticisms.

In "Grandfather's Letters, No. 9," the "trio" seem to be sufficiently satisfied with friend Inglewood's sentiments, as expressed in his letters, to invite him to call and make a closer acquaintance, and if, on further acquaintance, they find nothing more objectionable than what has already been shown, his prospects will be encouraging. Now, I wish to suggest to "Angio" that I am afraid she has overlooked one sentiment expressed in Inglewood's letter No. 8, where he explains himself on the "masculine supremacy" that he has been asked about. He says, "it is to the husband's home and business, style and mode of life the wife always comes, hence *he* only is competent to judge how far he may deviate from that course." Now, my dear sister, what are to infer from this sentiment? So far as I understand it, he will expect you to look upon the home, with all its appurtenances, as belonging to *him*, and that you will accept the situation in that home as his wife and governess to conduct the institution according to *his* will and pleasure, whether it suits *you* or not; for, mark you, he says "to the *husband's* home," etc., and "*he* only is competent to judge" if there shall be any change.

Now, lest I seem wearisome, I will close for the present by asking to be excused for meddling with other people's love letters. Girls' Rights.

Soquel, June, 1876.

A DO-NUT TO CRACK.

Mr. Editor: I wish to ask, through your columns, a little more information from "Snip." In the last (June) Agriculturist she gave some receipts for cake that would lead anyone to think that she had reached the hight and depth of economical art. In my housekeeping I wish, and try to be as economical as possible; but I must confess that I don't see how anyone can make doughnuts without flour, and have them good enough for the fastidious "Mary Mountain" to praise. My effort to make any eatable of them was a decided failure, but did not discourage me from trying the receipt for cookies, but with no better success. My experiment led me to conclude that she must understand a trick of the black art that none of the most learned professors has yet conquered. I hope the art is no great secret, because a knowledge of it will be hailed with joy, and she who can tell how to cook without eggs and flour will confer a lasting benefit on impecunious humanity.

San Jose, June, 1876. Ansie.

What can be more disastrous to the farmer, than to invest all his money and strength in one crop, which, may fail in a bad season, or if the price is low it will scarcely pay for the cultivation.

Boys and Girls.

Dandelion Clock.

Clock, white clock, that grows on the lea,
Tell the hour of the day to me;
Puff, puff, puff—one! two! three!
Dear, how late for school I shall be!
Clock, you've made a mistake you know;
You did not strike an hour ago!
Time flies fast on a morn in May;
Faster even than holiday.
But puff, puff, puff—one, two, three—
Surely so late it cannot be,

Clock, white clock, that grows on the lea,
When comes one to marry me?
A fairy prince with a crown of gold,
As he came to Cinderella of old;
His cloak of the violet's purple bloom
And in his hat a fair white plume?
Puff, puff, puff; puff and blow;
Silly clock will you never go?
Such a long weary time will it be
Ere my fairy prince shall come for me?

Clock, white clock, that grows on the lea,
Tell me what shall my dower be?
How many guineas of shining gold
Shall I count in my lap to have and to hold?
Enough to buy castles and acres fair,
And costly silks and jewels to wear?
Puff! What, all gone in one breath! Ah! me
For my jewels and castles and ships at sea!
Clock, white clock that grows on the lea,
You've no pleasant tidings to-day for me.

—[Mrs. Broderik.

"OUR CORNER."

River and Mountain Lesson.

SEVEN little boys and girls have sent in lists of rivers and mountains, competing for the premiums. First comes our little niece Olive Bouline of Saratoga, Cal., with 26 mountains and 79 rivers. Olive, you did not give your age, but you deserve credit for making out your list very neatly. This is what Olive writes:

Aunt Polly: I like the little folk's corner so well that I thought I would write you a few lines, though I am afraid my letter will not be very interesting. I found 26 mountains and 79 rivers west of the Rocky Mountains. Good by.

Olive.

Well, Olive, the only way to write is to *try*, and you have done pretty well.

Next comes our little Laura, and this is how she writes:

Dear Aunt Polly: I am 14 years old, and I have made a list of the rivers and mountains west of the Rocky Mountains. I have found 54 mountains and 146 rivers. Yours, truly, Laura Burdeck.

Pomona, Los Angeles Co., Cal.

Your list is very well gotten up, Laura. You write a very plain hand, and have numbered each one in rotation very nicely.

And next comes Master Alther, right into the Agriculturist office with his list. The printer told him he should write a letter to Aunt Polly, and with a pencil at the table he wrote the following in less than five minutes, without a single mistake:

Dear Aunt Polly: I saw the puzzles and geography lesson, but as I am not a good hand in guessing puzzles, I tried to see how many rivers and mountains west of the Rocky Mountains I could get. I got 177 rivers and 71 mountains. Next time I hope I will do better, if there is anything like this. Yours, respectfully,

Alther Feldman, San Jose.

Thank you, Alther. It is a very good ambition to have, to want to do better. That is why you have done so well now.

Now comes a little niece from as far away as Michigan. Hear what she says:

Dear Aunt Polly: My uncle takes the Agriculturist. He got home from California the 21st of April. I read the Agriculturist, so I thought I would try and see how many rivers and mountains I could find west of the Rocky Mountains. Here is my list of 78 mountains and 132 rivers. I was 10 years old last February. My uncle likes California real well, and when we sell our place here we are going out there to live.

Good by. Lucy Ford.

Strickland, Isabella Co., Mich.

Very good, Lucy, for a girl of 10. You are the only one who classified your rivers and mountains by Territories and States, but you mixed the names together too much on the page. Aunt Polly thinks you are ahead of any of your age in the class.

Our little niece in Salinas comes next. Hear her.

Aunt Polly: I tried to see how many rivers and mountains I could get. I found 100 mountains and 140 rivers. I am 12 years old. I shall have to stop.

Yours, truly, Gertie Smith.

Salinas City, May, 1876.

Now, Gertie, if you had not said "I shall have to stop," your letter would have been just as good. Your list is very neatly gotten up, not mixed at all, but every one plain. You deserve a credit anyway.

From Plymouth, Amador Co., comes our little niece with more mountains than anybody. Here what she says:

Dear Aunt Polly: I was fourteen years old last January. I have got 309 rivers and mountains and peaks. I did not know whether you would count peaks or not. Good by. Your niece,

Sarah Salle.

Aunt Polly finds that Sarah has 118 mountains and 191 rivers, which is a very good list indeed. If you had taken a little more pains in arranging your lists, it would be much easier for your Auntie to examine them and for the printer to set them in type. Your list of mountains will be found below. But, first, we will introduce you to Walter King, of Mountain View, who brings in the largest list of rivers, 274, and 101 mountains. Well done, Walter. Walter writes a very short letter:

Aunt Polly: I have done the best I can for mountains and rivers. I am 13 years old. Walter King.

We shall give Walter's list of rivers; but, first, one word. Aunt Polly offered the one under 10 years old who sent the most names of rivers and mountains a pair of chromos, also to the one under 12, and to the one under 15 years, who would send the most names of mountains and river a pair of chromos. Olive Bouline and Laura Burdeck have not told how old they are. So Aunt Polly will have to do this: send a pair of chromos to Lucy Ford, 10 years old, for rivers and mountains; one chromo to Sarah Salle, for most mountains; one to Walter King, for most rivers; Alther Feldman, 11 years, one chromo, for rivers, and Gertie Smith, 12 years, for mountains, one. This makes the three pairs of chromos, and distributes them as evenly, according to merit, as Aunt Polly knows how.

The lists of mountains and rivers which follow are the largest sent in, but do not include all withing United States territory on the Pacific Slope. So now listen to this

PREMIUM OFFER.

The one who will add to these lists the most names of rivers and mountains (to be found in United States and Territories west of the Rocky Mountains) a fine chromo of "Romeo and Juliet" or of "The Meeting at the Well" will be given. Now make this list as complete as possible. You have to the 10th of August to try in. The premiums for best puzzles will be continued from month to month. Now Aunt Polly wants you all to do your best, and you will try, wont you?

RIVERS (WALTER'S LIST).

Turtle, Colorado, Bill William, Big Sandy, Canon, Rio St. Maria, Rio St. Francisco, Colorado Chiquito, Bouche Fork, Chevlons, Cottonwood, Salinas, Puereo of the West, Mineral, William Fork, San Carlos, Ayisl, Pricto, Domingo, Santa Cruz, San Pedro, Vermillion, Elk Heak, Yampah, White, Oconagan, Oalesteo, Rio Puerico, Virgion, Skagit, Conejos, Dd Chaco, Rio Chilo, Swamish, Chekalis, Taxpam, Green White, Pisqualla, Cowlity, Coweema, Touchet, Caladum, Cathlapootle, Yahkeet, Columbia, Walwalla, Snake, Pelcose, Pisco, Yakima, Athnam, Nachees, Wenass, Pischous, Yakmsee, Spokane, Snaqualmie, Stalnkahamish, Kicketat, Clarke Fork, Feather, North Fork, South Fork, Tunis, Butte, Chico, Deer, Antelope, Beaver, Battle, Cottonwood, San Mateo, Canoe, Pitt, South Fork, Susan Pasa, Pahute, Beaver, News Fork, Green, Port Neuf, Tullick Fork, Smith's, Godin's, Hellgate, Flint, Black Foot Fork, Rio de San Jose, Rio de Chaca, Zuni, Gila, Timbres, Bear, Bonito, Yuba, St. Geraldie, San Inez, Santa Clara, San Gabriel, Santa Anna, San Jose, St. Luis, Pahute, Mohave, Kern, Pasa, White, Tule, Owen's, San Joaquin, Kings, Fresno, Chowchilla, Mariposa, Merced, Piedras, Tuolumne, Vierengs, Stanislaus, Calaveras, Grand, Mokelumne, Casumnes, Sacramento, American, North F'k, Middle F'k, South F'k, Humboldt, Granite, Truckee, Black River, Carson, Walker, West F'k, Rves, Putman, South Humboldt, North F'k, Rio Vegas, Virgin, Little Humboldt, White, Quns, American, Red F'k, Fish, Lake F'k, Spanish F'k, Weber, Jordan, White F'k, Black's F'k, Muddy, Ham's F'k, Jewett, Green's, Sevier, Canon de Chelly, Clara, San Jann, Bitter Root, Lo-Lo, Flathead, Rock, Salmon, West F'k do., Goodins, Lemhi, Big Wood, McArthur's, Kootenai, Clark's F'k Columbia, Big Snake, South F'k, North F'k St. Joseph, South F'k do., Clearwater, Upper Palouse, Wisser, Payette, Boice, Owyhee, Catharine, Bruneau, Malade, Middle Boice, South do., Bear, Pannoc, Lewis F'k, Cedar Springs F'k, Goose F'k, Salt, John Gray's, Henry's Fork, Nehalem, Alseva, Yaquuna, Sinslan, Hood River, Willow, McCready, Rogue, North Umpqua, South do., Willamette, Coquill, Nolalle, Clackmas, Calapooya, North Santium, South do., Lonk Tom F'k, McKenzie's, Sandy, John Days, Butter, McCready, Owyhee, Malkuer, Burnt, Powder, Fall, Cherry, Crooked, Sylvees, Grande Ronde, Umtatilla, Elk, Lost, Jordan, Granite, Guamas, Salinas, Smiths, Elk, Pelican, Klamath, Shasta, Redwood, Scott Mountain, Salmon, Eel, North F'k do., South F'k do., Trenitz, South F'k, Johns, New, North F'k, Big. Youga, Vandusens, Bear, Mad, Napa, Marion's, Bootham, Gassier, Wohalla, Russian, West F'k, Pajaro, San Benito, Nacismento, Rio Secco, St. Maria.

MOUNTAINS (SARAH'S LIST).

Pinos, Arrington, Bakoit, Olympus, Constance, Cascade Range, Runier. St. Helena, Adams, Coast Range, Gavilan, Blue, Sierra Nevada, Siskiyou, White, Pitt River, Humboldt, Hamilton, Lewis, Brewer, Day, Whitney, Tamalpais, Oso, Pierce, Baker, Shuksan, Granite, Dana, Cedar, Diablo, Mayacans, Balldy, Lyel, Tyndal, Toyabl, Granite, Kawlah, Santa Cruz, St. Luisa, San Bernardino, Rogue River, Bishop, Hornet, Sweetwater, Elk, Uintah, Wasatch, Jefferson, Yallo Balla, Hood, Spring Range, Callapooya, White Pine, Salmon River, Graham, Northside, Dome Rock, Davis, Spring, Glacier, Soledad, Sierra Lasal, Sierra Abajo, Wind River, Hornet, Hope, Pelon, Caso, Uarezo, Monument, Santa Inez, Eden, Mongollon, Coeur de Areme, St. Helena, Cedar, St. Johns, Saddle, Scott, Lynn, Umpqua, Ripley, Shasta, Inner Coast Range, Half-way, White, Zaremba, Iron, Pictos, Sierra De Platta, Diablo, Black, Campbell, Sierra Madre, Bielawski, St. Elias, Carezo, Uminhan, Mary's Peak, Castle P'k, Jeff. Davis P'k, Cannon P'k, Carrey's P'k, Spanish P'k, Humbuk P'k, Seven P'ks, Conie P'k, Pilot P'k, Lassen P'k, Pyramid P'k, Diamond P'k, Bartram's P'k, Mud Lake P''k, Novacam P'k, Pilot P'k, Umunhom, Snow.

Now, geography class, how many mistakes do you find in these lists?

PUZZLES.

A kiss for Daisy! for she is our youngest contributor. See what a nice letter and puzzle written by her own tiny fingers:

ST. HELENA- June, 1876.

Dear Aunt Polly: My papa takes the AGRICULTURIST and I like it very much. I love to make out the puzzles. I hope you will have one every month. I am eight years and a half old. I have no brothers or sisters. I send a puzzle.
My first is in wall, but not in floor;
My second is in bonnet, but not in hat;
My third is in girl, but not in boy;
My fourth is in lamp, but not in light;
My fifth is in orange, but not in lime;
My sixth is in leaf, but not in tree;
My whole is the kingdom we belong to.
Good by. From DAISY GLOCK.

LIVERMORE, June, 1876.

Dear Aunt Polly: I received my pictures. I think they are little beauties. Mother said for me not to make up a puzzle, but I have made up a small one, which I will send you. I think it splendid fun making up puzzles, and hope you will send us something that way every month. Here is my puzzle:
I am composed of 51 letters.
My 1, 3, 4 is a small insect.
My 1, 14, 20, 36, 25, 3, 46 is one of the Territories of the United States.
My 28, 46, 26, 29 is a small animal.
My 30, 38, 44, 31 is a color.
My 28, 6, 50, 40, 39 is a domestic animal.
My 5, 6, 21, 23 is what some children do when they get angry.
My 10, 3, 20, 25, 3 is a vegetable.
My 34, 35, 14, 16, 8, 13 is a color.
My 19, 20, 32, 15, 20, 45, 23, 26, 16, 34, 20 is one of the United States.
My 11, 47, 6, 35, 17 is something necessary to life.
My 22, 20, 48, 49, 25, 3 is a poet.
My 5, 10, 27, 46, 49, 6 is a vegetable.
My 18, 24, 12, 20, 13 is a girl's name.
My 22, 1, 3, 51 is a pronominal adjective.
My 34, 28, 20, 7, 6, 15, 10, 5, 28, 9 is a branch of study.
My 41, 20, 37, 36, 20, 13 is a name.
My 13, 18, 29, 31, 39, 12 end time and commence eternity.
My whole is a puzzle for the cousins.
Your niece, JENNIE D.

This is a pretty hard puzzle of the kind. Who can unravel it for Jennie?

MILPITAS, June, 1876.

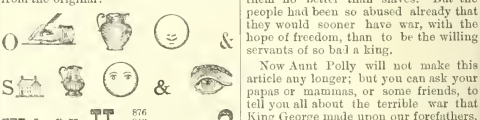
Aunt Polly: I felt very much flattered to see my letter published in the AGRICULTURIST, and thought I would try to merit a premium this time. Here are my puzzles:
1.—My first denotes a female; my second, what she wears; my whole, what she eats.
2.—I am composed of nine letters.
My 4, 6, 3 is a weight.
My 3, 2, 4 is good to eat.
My 5, 2, 4 is to place.
My 9, 6, 2 is who I am writing this for.
My whole is one who is much loved by many little children.
3.—I am composed of 16 letters.
My 7, 8, 9, 10 is something I don't like to do.
My 14, 3, 12 is a weight.
My 8, 9, 10 is a tree.
My 9, 10, 11, 12 is a bart of the body.
My 13, 6, 15, 5, 2 is a boy's name.
My 10, 6, 16 is a fowl.
My whole is the name of a great man whom this year brings forcibly to our minds.
4.—I am composed of 15 letters.
My 1, 13, 14, 4, 5, 2 is a girl's name.
My 12, 2, 14, 15 is an enclosure.
My 1, 13, 14 is to spoil.
My 1, 9, 10, 11 is where minerals are found.
My 14, 6, 3, 11 is uncommon.
My whole was the home of an illustrious person.
Yours, TILLIE.

A pretty long list Tillie. The Editor thinks the first one very good. Who can guess?

LIVERMORE, June, 1876.

Dear Aunt Polly: I did make out 334 different words from the word "carpets." I tried to see if I could make a puzzle. I have no idea of getting the chromos at all, but I thought it best to try. If you like it, I will send you another. Did I not send the greatest number of words of any of the girls? I will think it splendid if you send me the chromos. I had given up all hope of getting them until the other day my papa said, "May, Aunt Polly writes to you," then I read it. Well, Auntie, I must close.
Your niece, MARY D. CLARK.

Well, Mary, Auntie thought you deserved them, and so sent them. Here is Mary's funny rebus, a little changed from the original:



A friend sends this to "Our Corner":
My first is in bad, but not in good;
My second is in wood, also in could;
My third is in yours, but not in mine;
My whole is loved by sister mine.
L. W.

CARPENTERIA, May, 1876.

Dear Aunt Polly: I saw in the May number of the AGRICULTURIST that you offered chromos to those who would get over 359 word from "carpets." I got 377 words, and I send them to you. If you think they are able to get the chromos, my name and address is Linnie B. Caldwell, Carpenteria, Santa Barbara county, Cal.

P. S.—I am 13 years old. My sister wants to know if she can come in. She is 15 years old. L.

Yes, Linnie, and as you have beat them all, although late in the day, you shall have them. Tell your sister to consider herself a niece, and Polly her aunt, and that Aunt Polly hopes to get something good from her.

SOMETHING ABOUT THE CENTENNIAL.

BY AUNT POLLY.

"Auntie, where is the Centennial, and what makes folks talk so much about it? What is it for?" asked our little Willie the other day, and Aunt Polly had to explain how one hundred years ago (one hundred years is a century, you know) the English settlements in America—our country—belonged to England; that is, the English King claimed the right of governing the people in this country, as he had done for many years. Then she had to tell Willie how dissatisfied our people became with the English King through his bad ruling; how selfish and mean the King was; and how at last, just one hundred years ago this fourth day of July, 1876, (which was the fourth of July, 1776,) a meeting was held at Philadelphia composed of fifty-six men, chosen by the people of the different colonies, to get together and talk about laws and try to make things better; how these fifty-six men finally resolved, in the name of all the people of the thirteen States then United, that they would be free from King George, the bad English King, and that they would make a better government of their own, a government of the people of all the States of America. And these fifty-six good and wise men, called Representatives because they represented the sentiments and wishes of the people, all signed a paper called the Declaration of Independence. This paper was so called because it contained words declaring that the people would no longer be ruled by King George, and that they would have a government separate from, and independent of the King. Then the people all rejoiced, although they knew that King George would send great armies of soldiers across the ocean in ships of war to fight them and murder the people and destroy their property and try to make them no later than slaves. But the people had been so abused already that they would sooner have war, with the hope of freedom, than to be the willing servants of so bad a king.

Now Aunt Polly will not make this article any longer; but you can ask your papas or mammas, or some friends, to tell you all about the terrible war that King George made upon our forefathers, and how at last he was beaten and obliged to call his soldiers and his war ships home, and leave this country *free and independent*. Perhaps your folks would get you a child's history of the United States—our loved country—if you will promise to read it, and then you can know all about it for yourself. This year is the Centennial, because it is the hundredth birthday of our Nation, and the great Exhibition at Philadelphia is made in honor of our great birthday, and is really a national birthday party.

Dear children, Aunt Polly intended this month to tell you all about a children's school in San Jose, which is kept by a very benevolent and kind lady, who acts at once as mother and teacher to all her pupils. This good lady is herself a

cripple; but through her energy and love of doing good she has adopted several children. These she supports, besides teaching many others and caring for fatherless and motherless ones for very little compensation. This good lady's name is Miss Otterson, and her school is called the Children's Home, and as she loves children and is very good to them, Aunt Polly promises to tell you about her school next month; she would do so now, but the room in Our Corner is already pretty well occupied with other matters.

THREE IMPORTANT QUESTIONS.

ED. AGRICULTURIST: Observing from your editorial notes that you are always willing to disseminate information to the people, but more especially for the benefit of you numerous subscribers, allow me to suggest, for your consideration and approval, appropriating a small space in your columns to the promulgation of three laws passed by the last Legislature of great interest to the agricultural community, viz.: Amendment to the Fence Law, Amendment to the Road Law, and Lien on Stock for Pasturage.

The No Fence Law was brought into existence to promote immigration quite regardless of the interesests of the early settlers, and which has been fraught with much annoyance and vexation. Smith's fence was blown down by the winter blasts. He was protected from going to the expense of repairing it, and his neighbor, Jones, was compelled to fix it, or sell his six cows he kept for family use, or Smith would impound them.

The Road Law is another vexatious question. Persons having land back from the county road have to purchase their way through, after a delay of six months in petitions and surveying.

Farmers who take stock in on pasture are at great loss by dishonorable men who withdraw their stock surreptitiously by moonlight, and they are protected by inability to attach that by which he obtains a living.

Without further comment, I remain,

Yours, repectfully, P. HANSON,
Clayton, Cal., June, 1876.

[We invite our readers to discuss these three questions. Our columns are open. Now let everyone interested give his ideas.—ED.]

Fruits retail at higher rates in San Jose than any stranger, knowing how much fruit is produced here, would suppose. Strawberries average higher than in San Francisco, as our retail dealers ask a higher profit, and have to pay San Francisco wholesale prices. Other small fruits are governed by the same rule. Every year the fruit crops, as they are growing in the orchards, are nearly all bought up by either local or San Francisco dealers, mostly Italians, and the combination thus formed extorts high prices for everything at retail. The cherry crop has been very fine this season, but prices have ranged from 12 to 35 cts. per pound, in the midst of plenty.

The fruit canning factories consume large quantities of excellent fruit, which they contract for mostly months ahead. It seems the more fruit there is produced the greater the demand, and at advancing prices year by year. There is now better encouragement for planting orchards and taking good care of them than ever before.

A friend that you can buy with a present can be bought from you.

Grand Summer Resort---Lake Tahoe.

Our readers will notice the advertisement of our friend, Dr. Bourne, a veucrable philanthropist and common-sense practical physician, who has established a cure at Lake Tahoe. As a guide to health and pleasure seekers, we copy from the Nevada City *Transcript* of June 13th, some remarks by that editor, who has just visited Lake Tahoe. He says:

Lake Tahoe ought to, and will be, at no distant day, the great sanitarium of the Pacific Coast. It possesses climate, scenery, and means of health-giving pleasure for the eare-worn and debilitated, far ahead of any other place of resort. Everything around it is intended to afford quiet rest and pleasure. The business man is bound to forget his business while there. The scenery is too grand, the air too quieting and dreamy to allow business cares to absorb the attention. Last week we had the pleasure of visiting the spot for the first time. The season for tourists has just opened there, and it is expected the number of visitors will be greater than any previous year. There are ample accommodations for all who may visit the place, The best way to reach the Lake is by way of Truckee.

There are row, sail, and steamboats on the Lake for the use of tourists. A person can leave Truckee in the morning, go to Tahoe City, take a steamer and go around the Lake, a distance of over 100 miles, have an hour at the Grand Central for dinner, and return to Truckee again the same evening. There is a new screw propeller being built, to be called the "Niagara," and which will be completed this week, which is intended to carry passengers and to draw another large boat called the "Floatng Palace." The latter has a ladies' saloon, a dancing hall, and nicely furnished state rooms, and affords excursion parties the opportunity to enjoy themselves in any manner they choose. The steamers on their round of the Lake stop at all points of interest.

The "Niagara" and the "Floating Palace" will be under the command of Captain Powell, an experienced mariner. The "Governor Sanford," "Governor Blaisdell" and the "Emerald" also run on the Lake and make regular trips.

Lake Tahoe, as is probably well known, is 6,216 feet above the sea level. Its depth is 1,525 feet. It is 35 miles long, 15 miles wide, and has an area of 525 square miles. The water is ice cold and of crystaline purity. It is surrounded by mountains on whose summits snow is visible most of the year. It is the most beautiful spot in the State, and should be visited by everyone who has a love for the beautiful and grand in nature.

Tahoe City is quite a little town. Besides the Grand Central, are the Tahoe Hotel, the Custom House, a store, and several other houses of business and places of residence. The Hot Springs Hotel is on the north side of the Lake. Glenbrook is on the east side opposite Taho City, and there are two hotels on the southeast side of the Lake, all of which places can be reached by steamer. Stages connect with steamers at Glenbrook for Carson, and one going to Virginia City will find the route from Truckee by the way of Glenbrook and Carson preferable to the regular route by railroad. We advise anyone who desires a pleasure trip and a season of rest to hie them to the summit.

Butter will remove tar spots. Soap and water will afterward take out the grease stain.

The Granaries of the Nile.

A San Francisco correspondent of the Baltimore *Sun* writes: Prof. Davidson has returned from a professional visit to Egypt. Having viewed the progress being made in opening cheap communication between Alexandria on the Mediterranean and the interior of equatorial Africa, he thinks it is high time for California to study the coming changes likely to affect the American interests. He tells us that the whole valley of the Nile, so far as its present navigation gives it boundary, does not exceed in fertile area the two continuous valleys of our Sacramento and San Joaquin rivers. But there are 500,000 acres now gradually being reclaimed by irrigating canals, which will add largely to its agriculture. Besides this, the gradual substitution of steam for the many thousands of hand and ox water-lifters along the banks of the Nile will increase the crops fully one-third. Three hundred and fifty thousand acres have been reclaimed by the present ruler, who has made irrigating canals next to the desert and back of the Nile, where the overflow of the Nile did not reach. The population is more dense than in Belgium, Europe's most densely-populated state. The improvements will give employment to all whom they will displace.

Assuming the valley to be 600 miles long and 10 miles average width, ending at the first cataract, the carriage of products is very cheap because it has free navigation. The several cataracts are being turned or otherwise made passable, so that very soon there will be steam navigation for 1,500 miles from the seaport to the beginning of the great Soudan country, and beyond this point there are now 1,000 miles of free boating, through a country of no mean productive capacity, including mines of gold, silver, copper, etc., and forests of valuable woods, mostly new to commerce.

The country known as the Soudan, though in the tropics, is tempered by its altitude. The Soudan is over 2,000 miles long, by probably 300 or 400 wide. It includes Nubia, Abyssinia, Darfour, Uganda, etc. It has a continuous expanse of the richest and best watered lands in the world, estimated at 200,000,000 of acres of two-yearly crop land, producing wheat, maize, barley, and other grains unknown to us, cotton, sugar, tobacco, wool, mohair, silks, coal, cabinet woods, ivory, peltries, ostrich feathers, etc. With labor ten cents a day, and the cost of transit proportionably low, compared with our rates, and a year's clothing taken at less than $5 per man—women at half price doing a man's work—it is certain that Alexandria is about to become the greatest center of supplies for all Europe. How can wheat from California or from any American port on the Atlantic enter into competition in the markets of Europe? There is surely approaching rapidly a radical change in the currents of commerce, and Alexandria is about to regain its former position of chief granary to the Mediterranean nations, which will now embrace all Europe. Unless America gives immediate consideration to these facts she will be illy prepared to meet, when it comes, the great commercial revolution.

We should practice temperance, if it were for nothing else but the very pleasure of it; it is the glory of a man that hath abundance to live as reason, not appetite directs.

Subscribe for the AGRICULTURIST.

The Reapers.

The reapers bend their lusty backs;
Their sounding sickles sway;
At every stroke the golden sea
Recedes to give them way:
The heavy ears fall bowing down,
And nestle at their feet,
Such will, such work as theirs, perforce,
Must win—must homage meet.

So careless of fatigue, they go,
So true, and steadily,
The admiring traveler on the road
Leans o'er the gate to see:
With marvel of the soon-fallen breath,
The lounging gossips tell;
But the reapers labor for us all;
'Tis need they should work well.

Ere the great sun that burns above
Shall crimson in the west,
And the children's poppy nosegays fade,
And they lie down to rest,
Each golden spear that upward points
Shall fall upon the field,
And the farmer fans his sweating brow,
Rejoicing o'er the yield.

Fly, bonny men, your sickles bright,
And give the people bread!
At every conquering stride you take,
Our wants and woe you tread;
Drop, heavy ears, and give the strength
You gathered from this plain,
That man may rise refreshed and firm,
And do great things again.

God bless the hands, all hard and brown,
That guide the cleaving plow,
That cast abroad the shining seed,
And build the wealthy mow;
They bear the bread our children eat;
'Tis by their toil we live:
Hurrah! give them the loudest cheer
That grateful hearts can give!

—[Chambers' Journal.

Does It Pay?

Does it pay to have fifty workingmen poor and ragged, in order to have one saloon-keeper dressed in broadcloth and flush of money?

Does it pay to have one citizen in the county jail because another sells him liquor?

Does it pay to hang one man because another got him drunk?

Does it pay to have a dozen intelligent young men turned into thieves and vagabonds that one man may get a living by "selling them rum?"

Does it pay to receive $15 for a rum license, and then pay $20,000 for trying a man for murder, induced by the rum sold him?

Does it pay to have a thousand homes blasted, ruined, defiled, turned into hells of misery, strife, and want, that some wholesale rumseller may build up a large fortune?

Does it pay to have twenty mothers and their children dress in rags, live in hovels, daily famish, that one sumseller's wife may live in ease and affluence?

Does it pay to have hundreds of thousands of men and women in almshouses, penitentiaries, and hospitals, and thousands more in the asylum for the idiotic and insane, that a few heavy capitalists of the whisky ring may profit by such atrocity?

Does it pay to tolerate a traffic which breeds crime, poverty, agony, idleness, shame and death wherever it is allowed?

NO!

TALL GRAIN.—Thomas A. Shaw, of San Jose, writes this story of tall grain: I have harvested a bundle of rye from William H. Hall's ranch, two miles from Santa Clara, nine feet high, and started it for the Centennial. It beats anything in grain that I ever saw or heard tell of, by a good deal. Measure off a nine-foot pole and take a look at it. Hall has 100 acres. Of course the yield will not average as high, but it is all simply immense. Paper mills are offering $9 per ton for the straw, after it is threshed, and good hay is only worth $10 to $11. Hall will thresh it and sell the straw.

OUR VALLEY.—Gardner B. Weeks, in his correspondence to the *Country Gentleman*, thus speaks of our valley:—Santa Clara valley was arrayed in all the pomp of spring magnificence when I was there, and the prospect for the abundant fruit crop was most flattering. I was told of one man at San Jose who last year sold 54 tons of cherries, plums, prunes and apricots, from six acres of land; of another who is now getting $100 an acre yearly rent for land, which originally cost him less than that sum, but which he wisely stocked with fruit trees only a few years ago. The daily shipment of strawberries from San Jose, in the height of the season, is frequently 90 tons. Although the amount of fruit raised in that is enormous, and is increasing yearly, yet there seems no present prospect that the business will become unremunerative. A canning establishment, started in a small way, has been repeatedly enlarged—a process now being again repeated. To men with some capital and a liking for fruit-raising, it appears to me that Santa Clara valley offers inducements beyond any other part of this State. San Jose is a handsome and tolerably busy city, of about 16,000 inhabitants, and it has church, school, library and other facilities and advantages, equal to eastern cities of like size.

SENDING PRAYERS IN A CART.—MR. Spurgeon tells the following story: "A poor man who had a large family gave them a very comfortable support while he was in health. He broke his leg, and was laid up for some weeks. As he would be for some time destitute of the means of grace, it was proposed to hold a prayer meeting at his house. The meeting was led by Deacon Brown. A loud knock at the door interrupted the service. A tall, lank, blue-frocked youngster stood at the door with an ox-goad in his hand, and asked to see Deacon Brown. 'Father could not come to this meeting,' he said, 'but he sent his prayers, and they are out in the cart.' They were brought in, in the shape of potatoes, beef, pork and corn. The meeting broke up without the benediction. Nor did the poor fellow suffer during his whole confinement. The substantial prayers of the doner became means of grace."

THE CALIFORNIA AGRICULTURIST AND LIVE STOCK JOURNAL, for May, is at hand. As usual, it contains a large amount and variety of matter of peculiar interest to the farmer, gardener, and stock-raiser, and is always worth twice the amount of subscription price, which is only $1.50 a year. "California Agricultural Publishing Company," San Jose.—*Alameda Encinal, May* 13.

Whenever a person takes a country paper to get information concerning the region it advocates, and finds from ten to twenty saloons or dend-falls advertized and puffed in every issue, it don't take long for such, if the welfare of the family is any inducement to settlement, to conclude that no amount of good land or climate will compensate for these.—*Lompoc Record.*

A journal devoted to the cause of women, proposes that a Magdalen asylum be opened for depraved men, where they would live under ban, be poorly fed, and after a certain time, if signs of reformation appeared, placed in families, always, however, hearing about the brand of their degradation, as a wholesome and just punishment.

The farmer who keeps everything about the premises tidy, all the animals in a comfortable condition, who has plenty for his family's support, is out of debt, (or whose affairs are in a prosperous condition), is at peace with his neighbors, takes the papers, buys good books, is truly nature's nobleman, and can truthfully say: "I am monarch of all I survey; my rights none dare dispute." Such a one the king on his throne may well envy, and the merchant, or professional man is naught when compared with this.

Lake Tahoe.

BY SARAH E. CARMICHEL.

Lake Tahoe, sweetest lake of lakes!
The vision of thy beauty breaks
With starting power upon the eyes,
A sheen of water gleaming high
Above the tall, dark-pointed pines;
Apparently thy wave inclines
Toward the sun, who pauses there
To dress his long, bright amber hair;
And many a loose, thick, shining tress
Twines round thee in a warm caress;
Nor does thy bosom's picture slight
His most impassioned glance of light.
The day, whose smile thy mirror takes,
Hath named thee sweetest lake of lakes!

Lake Tahoe, sweetest lake of lakes!
The cresting foam oft overtakes
And tramples on the soft, white feet
Of day, unwilling to retreat
From the deep tide that charms its sense
By a heart-worship so intense.
Oh, pale amethyst gem that shines,
Clasping the leafy crown that twines
The proud Sierra's cold, pure brow,
Shine on, forever, fair as now!
Glow, many-tinted water, glow!
There is no brighter wave below.
The night, that mornfully forsakes,
Hath named then sweetest lake of lakes!

Lake Tahoe, sweetest lake of lakes!
A thought of awe intense awakes
Within the soul that lingers where
Thy tranquil bosom slumbers fair,
Like a bright tear of pitying love
Wept warm from heavens that lean above,
When the full starry dome is seen to see
How lovely this hushed world can be,
And view, with tranced and wondering eyes,
Thee, looking upward to the skies,
So beautiful, they half forget
That earth is not an Eden yet.
I, in whose dreams thy beauty wakes,
Have named thee sweetest lake of lakes!

FOR CONSUMPTIVES!

And others suffering from

CHRONIC DISEASES

—IN—

LAKE TAHOE.

SUFFERERS FROM ASTHMA, BRONCHITIS, Consumption, all Lung Diseases and all Chronic Diseases, are informed that DR. BOURNE has devoted more than Two Years to a careful study of the meteorological phenomena of Lake Tahoe, with special reference to its climatic value for sufferers from lung diseases. His experience satisfies him that it probably is, from its altitude and peculiar surroundings, UNEQUALED by any other known region on earth for its climatic aid in such diseases.

Without Medicines, Dr. Bourne effects cures in cases considered hopeless under other modes of treatment; his method being peculiar to himself, and the result of an experience as a Water-Cure Physician during more than a third of a century.

It is Dr. Bourne's effort to make quick cures in all cases, and he always designs to be, and is, eminently successful; but upon no condition will he accept a patient who entertains the absurd opinion that "sick people must not eat."

☞ Cures in Dyspepsia Guaranteed.

The best of food, and plenty of it, will be provided.

A limited number of patients will be received who may be willing to pass a few weeks in retirement and primitive simplicity.

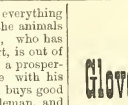
Address,

DR. GEO. M. BOURNE,

Tahoe, Placer Co., Cal.

☞ The National Gold Medal was awarded to Bradley & Bulofson for the best Photographs in the United States, and the Vienna medal for the best in the world.

429 Montgomery street, San Francisco.



Gloves Gloves.

CHEAP, COMFORTABLE, SERVICEABLE

THE ANGORA

ROBE AND GLOVE CO.,

OF SAN JOSE, CAL.,

Are making a Specialty of Manufacturing all styles of Gloves from the Angora Goat Skin, and claim for them:

1st.—They are cheaper than buckskin gloves.

2d.—The skins are tanned with the grain on, and are very nearly water-proof, and when, by long exposure, they are wet, they dry out perfectly soft—as good as new.

3d.—They will out-wear the best buckskin gloves.

4th.—For a HARVEST GLOVE, they have no equal.

These articles are manufactured in all styles, from the cheapest Laboring Gloves to the Finest Fur Gauntlet. Also, all descriptions of

FURS, ROBES, MATS, RUGS, Etc

Which, for Beauty, Durability, and Cheapness, are inferior to none.

Buckskin Gloves, Mittens, Etc.,

In all verieties, and as good as the best.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

ONLY 25 *CENTS.*

Comfortable Combination Clothing.

THIS STYLE OF UNDERCLOTHING FOR Ladies has been found by all who have used it, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying to **Mrs. Herring,** east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen,) or by addressing

C. C. C. Company,

Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. It is the invention of a California lady who makes every pattern herself and writes full directions upon each. No family that once tries this style of clothing will ever go back to the others.

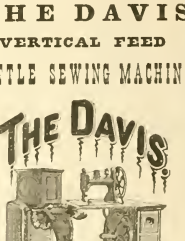
THE TRUTH ABOUT

THE DAVIS

VERTICAL FEED

SHUTTLE SEWING MACHINE.



IT DOES NOT TAKE AN HOUR TO get ready to do a minute's work, but is always ready in a minute to do a day's work.

The Favorite of the Family circle. Runs more easily and quietly than any other machine.

The DAVIS presents these advantages: It prevents ripping or gathering of goods, will sew over thick seams, or from one thickness to another, without change of stitch or tension, and make the most Elastic, Durable and Uniform Lock Stitch of any Machine before the public.

The only one having an Automatic Bobbin Winder, and the most wonderful attachment for making the Knife Pleating.

The peculiar feature of the DAVIS is its VERTICAL FEED, which is essentially different from any other Machine manufactured, requiring no acquired skill to operate it, nor basting of the goods, and all should give it an examination at least before purchasing any other.

After six weeks' trial at the Franklin Institute Exhibition, held at Philadelphia in 1874, it was

Awarded the Grand Medal Against Nineteen Competitors!

And has universally been awarded the FIRST PREMIUM at all principal Fairs where exhibited.

We have the best manufacturing machine in use.

Energetic and responsible Agents wanted in all unoccupied territory.

SOMETHING ABOUT WAGONS AND CARRIAGES.

"Where can I get a Good Wagon or Carriage, one that is made of the Best Picked Material, and put up in the most substantial and honest manner?" is a question that many a man seriously asks, either to himself or of some friend. It is really an important matter in these days of Cheap John shoddyism in everything. Men of intelligence know that a wagon or carriage made of the best picked materials, and properly put up, will run about as long again without repairs as one made of ordinary material in the ordinary manner, and in the end is three times as cheap. Paint can cover up, and polish can deceive; and the person who buys a poor article for use gets cheated, whether he knows it or not. If you want a No. 1 Carriage made to order to suit you, at reasonable figures, go to the **Pioneer Blacksmith and Wagon Shop,** corner of Fountain and Second streets, owned by **Mr. John Balbach,** and you will not be deceived in any particular. The workmen employed are under the supervision of these well-known, first-class mechanics: Mr. Balbach, blacksmith: Mr. Crydenwise, wood-worker: Mr. Claus, carriage-trimmer; and Mr. Greeninger, painter. All work done in a prompt and satisfactory manner. Repairing, Tire-setting, Painting, etc., in a thorough manner, at low figures.

Remember the place, Pioneer Carriage Works, corner of Fountain and Second streets, San Jose, Cal.

HEALD'S BUSINESS COLLEGE,

No. 24 Post Street
San Francisco, Cal.

DESIGNED TO IMPART A THOROUGH English Education, a Complete Business Training, and practical instruction in Modern Languages, Drawing, Telegraphy, etc. It gives to Pupils such a **Business Education** as has made them in demand in the mercantile community, during the past thirteen years, for commercial positions. In addition, students receive a **Thorough General Training,** which fits them for their duties as citizens and useful members of society. Every young man should endeavor to secure a course of training at this School, whose course of instruction is valuable to all classes. If farmers would have their sons successful on the farm, they should send them to this **Model College of the Pacific,** where they may be thoroughly educated in business affairs, as well as in the English branches. The thorough discipline of this School, and its careful training in correct business habits, are the greatest aid to future success in any calling. Pupils may enter at any time, as each receives individual instruction. Length of time required for finishing the course is about six months. Full particulars regarding Course of Study, Terms, etc., may be had by addressing

SAN JOSE FURNITURE MANUFACTORY.

Among the leading manufacturing enterprises on this Coast, and deserving of the success with which it has met, is the San Jose Furniture Manufactory. The Company, of which Mr. J. S. Bennett is the present head, was organized in August, 1874, only two years ago this month. Mr. Bennett, who is a thorough mechanic and hard-working business man, and who had been engaged in the practical work of furniture business for twenty years in the East, brought with him to this Coast the latest and most improved machinery for the manufacture of furniture. The first year this was put up in the building occupied by the planing mill on Fourth and San Fernando streets. The greatest difficulty in the start was experienced in obtaining skilled and reliable workmen, although the competition combined to break the enterprise down was only conquered by hard work and constant attention to the details of business. We have seen Mr. Bennett with one hand in a sling from being disabled in the machinery, doing the work of two workmen, besides superintending the business. Such indefatigable pluck and enterprise can but win, even against strong opposition.

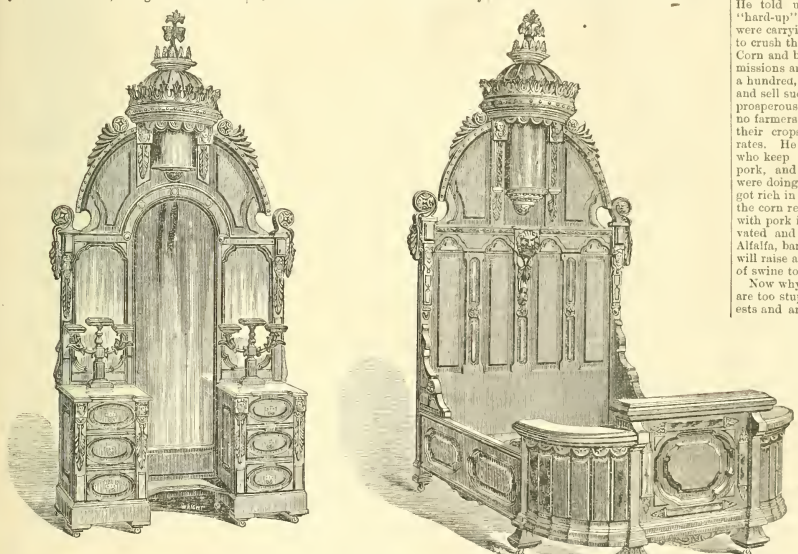
The factory, with still more and newer machinery, is now located on St. John street, between First and Market streets, and consists of two stories—engine and machinery below, and workshop above. All work is done by machinery except "setting up." The warehouse, upholstery department and furnishing rooms occupy a large building erected for the purpose and located on First street, embracing Nos. 224 and 226.

The firm employs from 20 to 30 hands. The amount of furniture turned out by this manufactory, from the raw material, is perfectly astonishing, while the quality of their work will compare favorably with the best made in any Eastern manufactory.

The elegant chamber set—the bedstead and dressing case bureau—here illustrated will give the reader some idea of the elegance of the work turned out at this establishment. This set was designed and made by the San Jose Furniniture Manufacturing Company. It was on exhibition last fall at the Santa Clara Valley Agricultural Fair, where, of course, it took a premium over everything else. It has since been purchased, and is now owned by Dr. Spencer, of this city, for his fine new residence on Third street. Several kinds of wood, including California laurel, are used in its construction.

By the way, the experiments of Mr. Bennett with various kinds of California timber, if written out, would be valuable. He finds that but few kinds of wood on this Coast are well suited to furniture making. The finer woods are only fit as veneering, as they warp and check badly used singly. Redwood is not fit for furniture. It splits and splinters easily, and shrinks badly. The Oregon cedar is a wood that neither warps nor splits, and is used largely as a foundation in cheap, substantial furniture. But the black walnut is the principal wood used, after all. Mr. Bennett hopes to see the time when the Eastern trees will be cultivated on this Coast extensively. As the various kinds of trees now cultivated become of size for use, he designs giving them a trial.

The sales department of this establishment is conducted by Mr. A. G. Bennett, brother of the manager, who has had many years' experience in the furniture business in New York and the Eastern States.



ELEGANT FURNITURE SET---Manufactured by the San Jose Furniture Manufacturing Co.

Altogether, this manufactory is a credit to San Jose and to California, and has proved to be not only a success as a business, but a convenience to old settlers and new-comers alike who desire good articles of furniture at reasonable figures.

FARMING VS. PLODDING.

We were lately talking with a farmer from Southern California about the prosperity of farmers generally in that section, and particularly about the farmers in the best corn growing districts. He told us that they were generally "hard-up" for money. Many of them were carrying mortgages that were bound to crush them with increasing interest. Corn and barley, after freights and commissions are out, average about 75 cents a hundred, and those who work hard and sell such crops are not in any sense prosperous. We inquired if there were no farmers who keep stock and feed their crops instead of selling at such rates. He replied that there are a few who keep hogs and other stock, make pork, and that, *without exception*, they were doing well and several had already got rich in the business. He said that the corn regions could supply California with pork if the land was properly cultivated and the crops used in this way. Alfalfa, barley and corn upon such soil will raise and feed an immense number of swine to the hundred acres.

Now why is it that so many farmers are too stupid to study their own interests and are contented to slave away at the hardest kind of work year after year without making anything but a poor living, and often less than that, when by adopting the right system, and intelligently working to make the best of their opportunities, they could soon be independent and have everything they want. Our ALL-WHEAT farmers belong to this same stupid class. They seem willing slaves to a thoughtless drudgery that keeps them poor. Few such men take or read agricultural papers. They "know too much about farming now," to take their own word for it. The fact is, they don't understand the first principles of farming, not one in fifty of them, if they did, they would be likely to practice something better than the one-crop system. They would go to *farming*.

What constitutes a State?
Not high-raised battlements or labor'd mound,
Thick wall or moated gate;
Not cities proud, with spires and turrets crowned;
Not bays and broad-armed ports,
Where, laughing at the storm, rich navies ride;
Not starr'd and spangled courts,
Where low-brown baseness wafts perfume to pride.
No; Men! high-minded Men!
Men who their duties know;
But know their RIGHTS, and, knowing, DARE MAINTAIN!

EDITORIAL NOTES.

The Santa Clara Valley Agricultural Society will open its annual fair the first Monday in October, to continue during the week—from the 2d to the 7th inclusive.

Our Domestic Department is not filled this month. Evidently our practical housekeeping correspondents are too much wilted by the hot term and hurry of harvest, in the kitchen, to talk or write much about it. We shall expect them to make up next time.

Contesting License.—The merchants of San Jose have commenced to agitate the question of contesting the constitutionality of the merchandise license tax. Why do not the fruit and vegetable producers about San Jose test the ordinance that prohibits farmers from peddling their own products without first taking out a license? Has not a man in this free country a right to dispose of his productions wherever he pleases, so long as he does not trespass upon private property? In our opinion, the license upon retailing farm products is not only an outrage upon American freemen, but upon the constitution of the United States. One that should not be tolerated by sensible men, nor endured by producers. If the city needs revenue let them raise it in a decent manner, by direct tax upon persons and property. The retail shop dealers claim that such a tax is "necessary for their protection." They ought not to be protected in such extortion as they constantly practice, and if they cannot make a living on an equal footing at their business, let them go at something else. This is, or ought to be, a free country.

Every season we find it necessary to complain about the wasteful practice of burning straw or allowing it to rot after the thresher in the field. No farmer has a right to thus destroy a valuable production. What would you think of a man that would burn his hay? Yet straw is at least one-third as valuable for stock feed. There would be none too much straw for the stock this State should keep, if it was all saved. If there is, why do so many thousand head go hungry, and even starve, every winter?

Live stock breeding, and the raising and fattening of stock for market, is altogether the most profitable branch of farming. No farm will run down under a proper system of stock raising in connection with cropping. The farmer who raises good stock, utilizes the heavy products in feeding and fattening, and markets at the proper age and condition, is on the up grade of prosperity, unless there is something radically wrong in some other management to over-balance the good. The perfect farm is well stocked, yields large annual crops, and grows richer instead of poorer every year.

Making and Saving.—It is easier for many persons to make money, or in other words to accumulate property, than to keep it. Saving does not always mean hoarding. The farmer saves his earnings who properly invests them in farm improvements—improvements of real utility as well as real comfort. To make every day's work and every calculation about work tell, is the main object, so far as getting is concerned. To properly use the means acquired so as to receive, in material and progressive benefits, the utmost use, and aid in further efforts to acquire, is, in our opinion, the true way of saving. Never spend a dollar foolishly, nor to gratify a bad habit

Annual Loss, $15.000,000!—This may look like a small sum to lose every year by the wear and tear of silver coin in handling, but it is probably a correct estimate, predicated upon the actual loss in weight. The loss in gold is proportionally as large, or larger. The wear, or loss on paper is nothing at all compared with these figures. Values are just as surely and reliably represented by pledges founded upon the honor of the Nation and wealth of the people, as by gold, silver, copper, iron, tin, or any other metal. The first cost of paper is but trifling, and it will do equal service with greater convenience and much less loss.

Machinery and brains are ruling the world of industry to-day. Mere brute force is at a discount. It needs a guiding power, a controling and directing energy to become valuable. Labor is ennobled only by brains. The laboring man who works for himself, and thinks, plans, calculates and aims at excellence in all he does, can succeed as well to-day, single-handed as ever before only when his efforts are made in the right direction. A laborer needs something more than a sickle to compete with a harvesting machine—something different from a mattock to compete with a plow. But there are channels of industry open to all. While the larger machine narrows the use of the smaller, it does not close any avenue of industry. As the world advances new avenues are opened. Surely if MAN stands supreme, MAN must lose no value or prestige as man, but rather be the gainer, and count all the more in the scale of worth. Let intelligent co-operation supersede monopoly, and manual labor will seek its true level at the top of society.

Ask Questions.—If you do not find the subject treated upon in your paper that you are interested in or would like to gain information upon, ask questions. The Editor is never more pleased than to answer inquiries, or submit them to others. It makes a journal interesting to all, to each month show an array of questions and answers, such as are generally or specially interesting to many readers. Ask questions upon whatever pertains to your calling, and see whether the AGRICULTURIST is practical enough to give, or elicit, an intelligent answer.

The Indian question is again agitating the public, as the brave Custer's fate is talked about. There are two sides to the question. Undoubtedly the trouble mainly arises from the white man's breaking faith with them. But there are two kinds of Indians, viz.: the tribes inclined to peace and the thieving, murderous tribes. The former are seldom troublesome. They soon take up with civilized ways and the simple arts of peace. The latter are never at rest in peace, and in war are remorseless in the extreme. Their only virtues are treachery and destructiveness. The warring tribes have from time immemorial been the terror of the peacable tribes, and can never be tamed into decent persons. Their nature, like the rattlesnake's, is to kill. They want to be prowling, stealing and committing depredations continually, either upon good tribes of Indians or upon white men. Two years' experience in the Apache and Navajo countries, where the peaceable Pimos, Papagos, Zunis and Pueblos dwell, and where the devilish Apache, Navajo and Comanche tribes were continually at war with them, and with us, plainly showed to us the distinction between good and bad tribes of Indians. While we believe in treating all Indians as well as possible, and advocate allowing the good tribes lands and even citizenship, we believe the mean, murderous tribes are entitled to no confidence, and the sooner they are exterminated the better for the rest of mankind.

How much better than a thief is a man who takes advantage of confidence to defraud another? Is he not even meaner than a thief? The thief asks no confidence, but takes from you, most likely, behind your back. You may be materially injured by the thief, but not morally outraged, as by the confidence man. Now, we wish to make direct application to such persons as take a paper year after year with the intention of not paying for the same, and who finally discontinue without paying for what they receive. We can afford to say that we think such persons meaner than sneak thieves. We have been defrauded in this way by many persons, too. Now, if there are any more such persons on our list, they may make personal application of this, get mad, and stop at once—take these remarks as an excuse for stopping their paper without paying before it runs any longer. It costs money to run this journal, and we cannot afford to be imposed upon. We are perfectly willing to send the AGRICULTURIST without pay in advance where the subscriber is accomodated by our so doing. It may not always be convenient to pay for a paper when the year is up. We are willing to trust. We are also willing to send the paper free for a time, on trial, and like to do so, so as to introduce it to new readers. What we complain of is, the deliberate meanness of the confidence class, who are too contemptibly mean to pay what they owe on a paper that they have for a long time received.

It will pay to read the new advertisements on the second page of cover.

There is a prospect that Congress will soon do something, one way or the other, with the Chinese question. A committee has been appointed to visit this Coast to inquire into the matter and report. We hope the immigration of Chinese to this country will be effectually checked.

The Wheat Question.—As we go to press the Grangers, some one hundred and twenty representatives, are in session in San Francisco for the purposes of discussing the wheat problem, and to protect their own interests. With what result we do not yet know. There seems a general disposition among the farmers of this State to hold on a while for better prices. The fruit-growers are also in session.

Comparative Value of Peas.—The following report from Mr. H. Curtner, of Harrisburg, Alameda county, who cultivates over a hundred acres of peas for market each season, will be of interest to some readers:

EDS. AGRICULTURIST: Agreeable to promise, I now report to you the result of trial of a lot of peas obtained through you from the Agricultural Department, Washington, D. C. The Dwarf Branching variety is very late and useless as a market pea in this climate. The Dwarf Blue Imperial grew well, but is too late, and not so sweet as the Champion of England, which we have found, from some years' experience, to be our best pea. The Caxton Alpha is very early, but the plant is weak. It is a shy bearer, and consequently unprofitable. H. CURTNER.

Kindness to animals is a sentiment that is grounded deeply in the conscientious nature of man. Education may develop this sentiment, and abuse may render it obtuse, but the really good person feels a spontaneous affection and regard for the animals that are placed within his power, especially for such as are subdued by kindness to man's servitude. The article which appeared in our June number, "Brute Animals Compared with Man," by our friend Dr. Chittenden, has been read with profit by many. In this issue, "Our Poor Relations," by friend Ingraham, will be found very deep in thought and instruction. Aside from the nobility of character shown by kindness to animals, and the conscious enjoyment to both man and beast, who are mutually benefitted by every kind act, there is profit—pecuniary profit—in being kind and considerate of the wants and needs of such stock as are useful to labor and as have a marketable value.

In order to supply the increasing demand, owing to our enlarged list of names, we are now publishing 3,500 copies of the CALIFORNIA AGRICULTURIST. This is 500 more than we started the present volume with. We expect, and intend, to increase it 500 more before January, 1877. It circulates in every county in this State, and in all agricultural districts in Nevada, as well as generally over the Coast. The paper has not less than 10,000 readers, as the copies are seldom destroyed, and are very generally sent abroad to friends, after families taking are through reading them. Not only is the typographical appearance of the AGRICULTURIST elegant, but its contents is largely original. It contains no objectional advertising or puffing, and it aims to truly represent the honest features of its locality, of its State, and of the Pacific Coast. The AGRICULTURIST is every where respected, and for appreciation we leave it upon its own merits alone.

Poetry.

The Little Black-Eyed Rebel.

BY WILL CARLETON.

A BOY drove into the city, his wagon loaded down
With all to feed the people of the British-governed town;
And the little black-eyed rebel,so cunning and so sly,
Was watching for his coming from the corner of her eye.

His face looked broad and honest, his hands were brown and tough,
The clothes he wore upon him were homespun, coarse and rough;
But one there was who watched him, who long time lingered nigh,
And cast at him sweet glances from the corner of her eye.

He drove up to the market, he waited in the line—
His apples and potatoes were fresh and fair and fine;
But long and long he waited, and no one came to buy,
Save the little black-eyed rebel, watching from the corner of her eye.

'Now who will buy my apples?" he shouted, long and loud;
And "Who wants my potatoes?" he repeated to the crowd;
But from all the people round him came no word of a reply,
Save the black-eyed rebel, answering from the corner of her eye.

For she knew that neath the lining of the coat he wore that day
Were long letters from the husband and the fathers far away,
Who were fighting for the freedom that they meant to gain or die;
And a tear like silver glistened in the corner of her eye.

But the treasures—how to get them? crept the question through her mind,
Since keen enemies were watching for what prizes they might find;
And she paused a while and pondered, with a pretty little sigh;
Then resolve crept through her features, and a shrewdness fired her eye.

So she resolutely walked up to the wagon old and red;
"May I have a dozen apples for a kiss?" she sweetly said.
And then the brown face flushed to scarlet, for the boy was somewhat shy,
And he saw her laughing at him from the corner of her eye.

"You may have them all for nothing, and more, if you want," quoth he.
"I will have them, my good fellow, but can pay for them," said she;
And she clambered on the wagon, minding not who all were by,
With a laugh of reckless romping in the corner of her eye.

Clinging round his brawny neck, she clasped her fingers white and small,
And then whispered "Quick, the letters! thrust them underneath my shawl.
Carry back again this package, and be sure that you are spry!"
And she sweetly smiled upon him from the corner of her eye.

Loud the motley crowd were laughing at the strange, ungainish freak,
And the boy was scared and panting, and so flushed he could not speak;
And, "Miss, I have good apples," a bolder lad did cry;
But she answered, "No, I thank you," from the corner of her eye.

With the news of loved ones absent to the dear friends they would greet,
Searching them who lingered for them, swift she glided through the street.
"There is nothing worth the doing that it does not pay to try."
Thought the little black-eyed rebel, with a twinkle in her eye.

"*A Friend in Need,*" etc.—Reliability and fair dealing are virtues in business which can be appreciated in no case more than when the services of an undertaker are needed. Messrs. Trueman & Woodrow, of this city, have earned the reputation for straight forward and honorable dealing in every detail that makes them hosts of friends. They are often charitable, but never exhorbitant.

Prophecy of the Future Glory of America.

The following prophetic poem, by an anonymous contributor, was published in some of the colonial journals prior to the Declaration of Independence in 1776:

To years far distant, and to scenes more bright,
Along the vale of time extend thy sight,
Where the the hours and days and years from you bright pole,
Wave following wave, in long successions roll;
There see in pomp, for ages without end,
The glories of the Western World ascend!

See, this blest land in her brightest morn appears,
Wak'd from dead slumbers of six thousand years
While clouds of darkness veil'd each cheering ray,
To savage beasts and savage men a prey.
Fair Freedom now her ensign bright displays,
And peace and plenty bless the golden days.

In mighty pomp America shall rise,
Her glories spreading to the boundless skies;
Of ev'ry fair, she boasts th' assembled charms,
The queen of empires and the nurse of arms.
See where her heroes mark their glorious way,
Arm'd for the fight and blazing on the day.

Blood stains their steps; and o'er the conquering plain,
'Mid fighting thousands, and 'mid thousands slain,
Their eager swords promiscuous carnage blend,
And ghastly deaths their raging course attend,
Her mighty power thro' subject world shall see,
For hatred conquest waits her high decree.

See her bold vessels rushing to the main,
Catch the swift gales, and sweep the wat'ry plain;
Or led by commerce, at the merchant's door,
Unlade the treasures of each distant shore;
Or armed with thunder, on the guilty foe
Rush big with death and aim the impending blow;
Bid every realm that bears the trump of fame
Quake at the distant terror of her name!

A Russian Fable.

BY LAURA SANFORD.

One day a farmer in his field
Was sowing oats for autumn yield.

A young horse watched him on his way,
And gave at once a scornful neigh.

"How foolish man is!" this colt thought;
"Here in the very act he's caught

"Of throwing oats upon the ground;
Could any rasher waste be found?

"Give me that heap, and I would show
What oats are good for—for I know.

"Or even give them to the crows,
They have more sense than this act shows!

"Or hoard them carefully away.
Man may want oats some future day!"

Well, time passed on. The autumn grain
Was garnered from the field again.

The farmer gathered oats tenfold,
And gave the horse all he could hold.

Are we not sometimes like this colt?
We send a criticising bolt

'Gainst higher powers. We call waste
What is but wisdom, viewed in haste.

We mock the providence that sends
Its aim through darkness to kind ends.

The Rain Drops.

A farmer had a field of corn of rather large extent,
In tending which, with anxious care, much anxious toil he spent;
But after working hard and long, he saw with grief and pain,
His corn began to droop and fade because it wanted rain.

So sad and restless was his mind, at home he could not stop,
But to his fields repaired each day to view his withering crop.
One day he looked up despairing, at the sky,
Two little rain drops in the clouds his sad face chanced to spy.

"I feel so grieved and vexed," said one, "to see him look so sad,
I wish I could do him some good, indeed I should be so glad,
Just see the trouble he has had, and if it should not rain,
Why, all his toil, and time, and care he will have spent in vain,"

"What use are you," cried number two, "to water so much ground?
Your are nothing but a rain drop, and could not wet a mound."
"What you have said," his friend replied, "I know is very true,
But I'm resolved to do my best, and more I cannot do.

"I'll try and cheer his heart a bit, so now I'm off: here goes!"
And down the little rain drop fell upon the farmer's nose.
"Whatever's that?" the farmer cried; "was it a drop of rain?
I do believe it's come at last; I have not watched in vain!"

Fow, when the little rain drop saw his willing friend depart,
Said he, "I'll go as well and try and cheer the farmer's heart."
But many rain drops by this time had been attracted out
To see and hear what their two friends were talking so about.

"We'll go as well," a number cried; "as our two friends have gone,
We shall not only cheer his heart, but water, too, his corn.
We're off, We're off!" they shout with glee, and down they fell so fast,
"Oh, thank the Lord!" the farmer cried; "the rain has come at last."

A Hundred Years.

BY F. J. WALKER.

A hundred years—it seemeth long
To us, the children of to-day—
We tell the tale and sing the song
Of olden time, so far away.

We sing of those heroic ones
Who spurned the shackles of a throne,
And grim behind the rolling guns,
Proclaimed that freedom was their own.

Speak out, ye cannon, now once more,
Behold to-day the whole earth hears
Thy voice—speak louder than before
The old truth of a hundred years.

The story of that ancient bell,
How lightly, joyfully it swung;
Indeed, it was oppression's knell,
And birth of liberty it rung.

Ring out' ye freedom-bells, again,
Your voice is welcome to our ears—
The key-note that ye sounded then
Has echoed through a thousand years.

Their battles-flags are folded now,
The sword is rusting on the wall,
The clod is on the soldier's brow,
But this is not the end of all;

For yonder flag with crimson bars—
How glorious its joy appears—
Flasots forth this triumph of your stars,
The freedom of a hundred years.

The freedom of a hundred years
They gave—oh, patriots sublime,
The harvest of your toil and tears
Shall ripen to the end of time.

Our Country Lives.

BY SOLON ROBINSON.

A hundred years! a century dead?
A hundred years with banners spread,
Our country lived, lives!
And gains by what it gives;
Grows young though growing old;
Grows strong on what it grows;
Though stalwart now, still growing tall,
From fat'ned wealth which overflows,
From golden mines the farmer finds in every soil.

A hundred years, while growing old;
A hundred States, may they untold;
And banners wave, wave
O'er States which Freedom gave
To form a Union strong;
And stronger grown by years,
Until Centeunial days shall be
Millennial too, in spite of fears,
That through some fatal, in several States, we yet might be.

A hundred years our flag has waved;
"Our Country," now on banners graved,
Our County still, still
As one in one good will,
Still every part as one
Joins hearts, and hands, and lives;
Lives now as through past years,
And every wrong of each forgives.
Through love of old and not through fears:
And that is why we cannot die—Our Country lives!

City Gardening.

Flowers.

The beautiful flowers, the beautiful flowers,
They've a mission pure in this world of ours:
They minister gently of hope and love,
They teach our spirits to look above,
And we gaze on them till our thoughts arise
To the glorious bowers of paradise.

Our garden is only a wee bit spot,
In front of our humble snow-white cot,
And the haughty florist might pass it by
As unworthy a glance from his practiced eye;
But dearer to me than regal bowers
To a monarch's heart, are our simple flowers.

We have gorgeous tulips of gold and jet,
And gaudy scarlet, in borders set,
We have gay carnations of brilliant hue,
And the beautiful moss rose gemmed with dew,
And we look on them with admiring pride—
But our love is for those on the other side.

There the delicate snow drop lifts its head,
And the violet peeps from its lowly bed;
And the breath of the lily, the pride of the vale,
Is floating sweet on the balmy gale;
While around our door the green ivy clings,
And the fragrant clematis its odor flings.

Dearly I love the sweet fragrant flowers,
They've cheered and gladdened my lonely hours,
And many a lesson they bear to me
Of holiness, meekness and purity.
Oh, dreary and sad were this world of ours
If God had withheld the bright, beautiful flowers!

TRIMMING PLANTS WHILE GROWING.

EVERY one admires a beautiful form in a plant, an evenness of growth of the various branches to give a fine balance to it. There are some plants whose habits are naturally straggly and uncouth. While they are growing a little nipping back of the leading branches with the fingers, or with a pair of shears, will hold them in check while other branches will be encouraged to grow to the same size. We will cite, for instance, the Lemon Verbena. This seldom mades a sightly shrub when left to itself, although it is a favorite owing to its sweet scent and deliciate green. By pruning back the leading branches, it will soon grow into a well-rounded and closely furnished bush. If you wish it to grow tree-shaped, encourage it to grow tall by nipping back the ends of side limbs till it has acquired the right hight; then, to prevent it growing one-sided and to make it well-formed, nip back all shoots which are out of balance. This same system can be applied to roses geraniums, and in fact to any plants that are desired to grow into better shape. It is not at all necessary to cut branches off close to the stalk, in fact it is better not to do so. But a little nipping back of the ends of growing shoots is all that is required.

MADEIRA VINES IN-DOORS.

A San Jose lady is cultivating the Madeira vine in-doors. She has some growing in pots upon the parlor mantle. The vines are wreathed over and about the frames of pictures upon the white walls, and are as delicately beautiful as anything we ever saw. Out of doors, the Madeira vine grows vigorously and produces a heavy, dense foliage. In-doors, the vines are slender, the leaves fine in texture and tender green, and really our ideal of perfection. We had to ask what it was, so different did it look from the Madeira vine which twined over the trellises of the piazza in front of the cottage. We are sure that any lady who will try it, will be thankful for the information. You can procure the tubers that cluster about the base of Madeira vines as they grow out of doors, and

plant them in pots containing sand, enriched with a little fine stable manure, well mixed together. Keep the soil well moistened in a warm place until the vines start, the put wherever you wish the vines to climb, and with proper care the growth will soon delight and astonish you. The English ivy is often seen growing in bottles of water hung up behind picture frames. It is very pretty. The Wandering Jew is also grown in the same manner. But while these latter plants are fine ornaments, the Madeira vine is, for delicacy and beauty, as far ahead of them as you can well imagine.

We are assured that many of our lady readers are much pleased with the "City Gardening" department. We think they would be much better pleased if each reader would contribute some little fact gleaned from her own experience in cultivating plants, and also ask for information about any particular plant or manner of cultivating that she would like to know more about. We want each one to feel enough interest to contribute to this department.

Fern Culture in the Parlor.—The following, from the *Country Gentleman*, is splendid advice to follow:

Ferns are plants the culture of which is very interesting, either in the greenhouse or the parlor. Nothing adorns a sitting-room more than a case of ferns in luxuriant health. A case for this purpose may be made of any size, and almost any shape. In their construction, however, several particular points have to be borne in mind, for the best benefit of the plants which are to grow in them, the first of which is a means of obtaining *a thorough drainage*. More failures occur in the cultivation of plants in Wardian cases, from imperfect drainage, than from any other cause, nothing being more injurious to the plants than sour, stagnant soil; and however porous the soil itself may be, without perfect drainage it cannot be long in a condition suitable for supplying a healthy food for plants; the water retained in the soil having no means of escape, sours it. To secure good drainage, also dryness and tidiness in that part of the room where the case stands, two bottoms are necessary; one, the true bottom, which should be thoroughly perforated to allow the free escape of the water; below this one, another should be placed to receive the water as it passes from the soil, and therefore requires to be water-tight, and so adjusted that it can be emptied and cleaned without disturbing any other part of the case. On the upper bottom place a good thick layer of pot-shreds and charcoal for drainage. Upon this put a small mound of suitable soil for ferns—peat, loam and a good mixture of sand—secure in this mound small stones and shells, so as to imitate a small rock work, allowing sufficient cavities for planting ferns and mosses.

Proper means of ventilation is also necessary, which is best acquired by having part of the roof movable. When so constructed that the movable part can slide over the fixed part, it gives the least trouble, and is the most convenient when cleaning, watering or planting the ferns. Top ventilation is better for the welfare of the plants than when side ventilation is adopted, as then there can be no ill effects arising from cold draughts passing through them.

When planting the ferns, put some erect growing kinds at the top, and the more dwarf and bushy ones on the sides of the mound, using moss for carpeting the whole. Upon removing the plants from the pots, do not break up the balls any before planting; the roots will soon make a start in the fresh soil, which should be pressed rather firmly around the roots. After the plants are in, give a good watering, and shut close for a few days.

In selecting plants for such purposes, dwarf-grown plants, in small pots, are the best.

Pretty Arrangement of Plants in Pots.—Among the prettiest things we ever seen in the London flower market, says the *Garden*, are small pots containing growing plants of forced Lilies of the Valley, and a few fine crimson Tulips, growing out of a healthy little tuft of the common Maiden-hair ferns.

The same journal, of January 1st, said among the most beautiful of all pot plants now brought to Covent Garden market is the lovely little Siberian Squill with drooping flowers of the clearest and most vivid blue color imaginable. Nothing could be psettier than pots of Lilies of the Valley and tender young ferns, neatly but not too regularly margined with this beautiful little Alpine bulb.

Ozone Generated by Plants and Flowers.—One of the most important of the late discoveries in chemistry is that *ozone* is generated in immense quantities by all plants and flowers possessing green leaves and aromatic odors as, for instance, Hyacinths, Hehotrope, Mint, Lavender and the like. So powerful is this great atmospheric purifier, says the *Sanitary Record*, that it is the belief of chemists that whole districts can be redeemed from the deadly malaria which infects them. by simply covering them with aromatic vegetation. Every little flower pot, therefore, is merely a thing of beauty while it lasts, but a direct and beneficial influence upon the health of the neighborhood in which it is found.

Beautiful Floral Ornament.—Take a soup-plate or a pickle-dish, and fill it with sand. Moisten the sand with water and heap it to a cone, and then thrust into the wet sand flowers and foliage enough to cover the whole surface, and you will have, if you arrange it well, the most beautiful floral ornament that can be imagined. This is an excellent way for arranging short-stemmed flowers, or those the petals of which are too soft to be tied without injury among stiffer ones. Or place in the centre of your soup-plate a tea-cup, a child's mug, or a wine-glass, in which insert a small bouquet, and then proceed as above. This will make a better cone than the first method.

Cheap and beautiful hanging baskets are made of round sticks, about one inch in diameter, eight inches in length at the bottom, increasing to fourteen at the top. In constructing, begin at the bottom and build up, log-cabin fashion; chink the openings with green moss, and line the whole basket with the same. They are easily kept moist, and the plants droop and twine over them very gracefully.—*Gardener's Monthly.*

Cheap Land, or Dear Victuals?—On the Overland train which arrived in San Francisco at six o'clock July 26, there was rn old man from the "Sucker State" on whose brows rested the snows of eighty winters, come to thaw them in our sunny clime and bathe his wrinkled visage in the gentle zephers of San Francisco. He seemed greatly disgusted with the country between here and Omaha and said that if anyone would give him a patent title for all the land he had seen on this side the Missouri River, in exchange for a meal of victuals, he would ask 12½ cents to boot!

A DAIRY HOUSE FOR HOT WEATHER.

Mr. Editor: As you are "suppose to know everything" in regard to farming, can you inform me how to build a cheap dairy house—one that will keep milk and butter cool in such weather as we have had for two weeks past?

Yours, W. A. T.

The above was received too late for our July number.

We can tell you how to make a good dairy so as to keep cool in hot weather, in fact, of even temperature during the year. This is a building entirely above ground, so as to secure perfect ventilation, boarded upon studding with matched or battened boards, inside and out, with roof also double, unless effectually shaded by trees. The floor should be above ground, and so arranged as to allow of a circulation of air between the floor and ground, through registers that may be closed in real hot days, or at will. Then, in connection with a wind-mill pump or other convenient apparatus, open troughs that can be supplied with fresh, cool well or spring water, in a slow, constant stream, at will, should be arranged about the room and milk shelves. Some dairies set the milk in pans or deep cans which are surrounded by this flowing water. A dairy room made upon this plan can be well ventilated even in very hot days, and still be kept cool by the water. The water evaporates, as it circulates through the room, sufficiently to cool the air admitted through screened windows necessary to sweetly ventilate the room. The best is generally the cheapest in the end.

A very cheap dairy on a small scale can be made by excavating, and making a room half above and half below ground, with ground floor, and roof either covered with earth or shaded by trees, boards, brush, etc. In this sort of a dairy but poor ventilation is generally given, and cleanliness seldom observed. Such a room may be well aired at night and on cool days, and by sanding the floor and cleaning up once a week, be kept in tolerably sweet condition. So long as nothing is allowed to get musty, and no rotten lumber is in walls or roof, such a cheap dairy may answer a very good temporary purpose, and is soon made by any one.

RETROSPECTION.

Farmers, at this season, when the crops are harvested, or being harvested, should take note of the same with an eye to improving upon all mistakes that have in any way been made this season. In what way could you have done better than you are doing this season? Did you plow just as you should have done, and put in crops during the right months? Did you procure the best seed and sow it just thick enough to produce the best crop? Would not that piece of land sown to wheat this season, which was very foul, have paid just as well devoted to hay and pasturage? Could you not have destroyed a crop of weeds, and prevented them from seeding the ground in this way, so as to get a cleaner crop of grain next season? Will it not pay to rotate from grain to pasturage and hay, and back to grain again, better than to sow grain on the same ground every season? Have you made as much, clear of expenses, as you think a good, prudent farmer should make, one year with another? If not, why not? Doubtless you will commence to think that you were not able to do any better, and in some way make personal exeuses. But, leaving self and all self-satisfied pride out of the question, looking at your affairs as an outsider would, how is it? Surely, if you are not either very fortunate or nearly perfect, there is some slight chance for improvement somewhere in your management, and it is a duty you owe yourself to ascertain in what direction, and to strive to do better next time; not to repeat the same mistakes, stupidly, from year to year. There are many branches of farming, and each locality, owing to conditions of soil, moisture, climate and surroundings, needs a little different management in some particulars, from others. You should study to know what system is best suited to your farm; what crops should preponderate; what kinds of stock, and how much, and in what proportion to keep, how to feed and market them to the best advantage, etc. Whatever your natural advantages or disadvantages, you should aim to make your farm a complete one, well balanced in every respect, with an eye to home comforts, conveniences, and farm profits. A sagacious man will profit by his mistakes by correcting them. A wise man will strive to profit by the success of others by adopting best methods. Only the self-conceited and ignorant man will think he knows it all, and be satisfied with hard work ill directed, when brains combined with muscle would make better progress with greater ease.

Farmers, study your own farms, your own business, and do not be contented without each year improving upon former ones in a manner to make your farm better, more profitable, more convenient, more fruitful, and your home in every respect a better and happier one.

DISEASED ORANGE TREES IN LOS ANGELES.

We have frequnetly read about a disease that is killing the orange and lemon trees in Los Angeles. Several newspapers have reported the cause to be an insect or fungus which causes the bark of the stalk near the ground to decay, with a slimy substance between the bark and the wood. We have lately had a talk with Mr. Eldred, an orange, a gentleman who has an orange orchard and who has made thorough observations. He declares that the cause of this trouble and loss of trees is from stagnant water about the roots. Too much irrigation of trees planted in heavy, ill-drained soil, at the season when trees need little water, is the cause of the whole trouble. We have read of trees dying in Louisiana from diseased roots, caused by too much water in the subsoil. These would first show signs of disease in the leaves near the top of the tree, and the fruit would crack open before ripe, finally the whole tree would die with slippery bark.

Too much irrigation upon heavy soil would certainly be likely to cause just such a disease as the Los Angeles orchardists complain of. In proof of his assertion, Mr. Eldred mentioned several orchards not irrigated, excepting once or twice in summer, that are entirely free from the bark disease. He says that there is nothing to be dreaded about this disease, and that it never has, and never will trouble trees that are not in too wet soil, or in soil kept too wet by irrigation. We trust that his premises are correct, as they seem plausible enough. We wait for further information.

To have the natural ability to perform an act without the moral ability, is no ability at all—is an absurdity. Without the *will*, there is no power.

OUR POOR RELATIONS.

BY D. G. INGRAHAM.

At this late day, in the nineteenth century, we are just beginning to feel some respect for the animal creation. Darwin has told us that we sprang from animals, and with some of us it was not much of a spring after all. Huxley evolves the human soul from a few drops of ammonia and carbonic acid, which, breathed upon by winds of oxygen, and shone upon by the electric rays of the sun, became in time a God-worshiping and man-loving being. The theologic school has told us that we were made out of the ground, and St. George Mivart has even conceded that the miraculous creation was simply the in-breathing of the soul of man after his body had been evolved by ages of development. Perhaps, after all, then, we are the children of dust and water. Our decent (or rather, ascent,) is traceable from such particles of dust as the coin we carry in our pockets, or the mud we scrape from our feet.

Look at the rocks that are one moment washed by salt waves and the next exposed to air and sunbeams, and you will see a little animal squatted on the rock and holding fast as if for dear life. You look him over and you find no eyes. You might look in vain for ears, or any of our senses. A careful examination will discover that of the five senses that we possess he has but one—the sense of feeling, and that rather blunted. He's a "poor relation." We are rich. Our faculties and senses open to us the universe of knowledge and feeling. He is poor. Satisfied if kindly Nature washes into his mouth the food that nourishes him and keeps him alive. We say, "poor relation," sure enough. "His poverty, however, is more evident than his relationship," some one will say. "Can it be possible that that miserable little jelly-bag has any kin to me who walks the earth *a man?*"

Yes, sir; it possesses *faculties* in common with you, and they are stronger links of evidence in the chain of proof than similarity of body or muscular structure would be. He possesses the faculty of enjoyment. That, alone, would show a common parent. God never made anything to be miserable. He, doubtless, made people and beings to be restless and unhappy at times that they might aspire to something better that was in store for them. More than that, our poor relation possesses the means of protecting himself, of showing his fears or his loves, of reproducing his kind, and last of all, *he lives*. That stamps him as the child of God. Of the eternal life which runs through all we see or know or feel he has a share. Though but an atom in the universe, "he counts one with God." Glued fast to the rock, he hears the common promise, "Be faithful over a few things, and I will make thee ruler over many things."

Never mind if our relations *are* poor. Let us not be ashamed of them. It is better to be the regenerate son of a chattering monkey than the degenerate son of a noble man. Better the going up than the going down. Perhaps we shall find our poor relations nearer perfect in their kind than we are in ours. It is quite natural that we should be self-satisfied. No doubt the animal and the vegetable have a certain satisfaction in themselves. The oak looks down in more senses than one on the scrubby rosebush; and the rosebush looks down on the violet. Just so does the Caucasian on the Mongolian and the African, forgetful that the sun shines for all, and that the rain and the dew are the gift of Nature to all. So our *poor* relations are only poor because *we* feel a certain proud satisfaction in ourselves. Poverty and riches are arbitrary terms. What is precious to Rothschild would be trash to a Feejee. It would be quite natural for an animal to think *his* kind THE kind, and *man* the "poor relation." Theodore Parker illustrates this in his "Convention of the Rumble-bees," and Pope in his "Essay on Man,"

"See all," says man, "created for my use;"
"See man for mine," replies the pampered goose.

But man seems now the creature whose turn it is to grow. Geologic ages have seen grasses and insects run their race, and give place to snakes and reptiles of gigantic frame. Ages were required to develop bone and muscle as well as the fruits and grains that sustain them. And now man comes in his turn to build up the brain. Examine the skeleton of a megatherium as it stands in our museums and you exclaim, "What bones!" If you could call back to those bones the flesh that once clothed them you would exclaim, "What muscles!" Now, examine, if you will, the skull of a Franklin or a Webster, and compare it with other skulls, and you cry out in astonishment, "What a brain in comparison to the body!" This is man's hour, and the age of brain. In the short era of written history man seems to be the only creature whose growth has been perceptible, and that growth has been in brain-power. We find that he has no more legs or arms or bones or muscles than he had ages ago. But way up in the attic of the house he lives in is a pulpy mass that is working miracles. There is the focus of growth. There is the gem that flashes out and seems in contrast to make other intelligences dark. Man has stepped onto the boards. He makes his debut, and the world of created beings sits dumb with astonishment at his acting. He is the one whom the Almighty "delighteth to honor."

But the Everlasting Love says, "All are my children, from the least unto the greatest; respect them as mine. My common love for you is proof of your common blood. Happiness finds the polyp on the rock; the flower by the roadside; the songster in the hedge; man in his home."

We beat and abuse—we eat and digest our poor relations, and think nothing of it. The strong-necked ox gives up his life that the fibrine of his muscles may strengthen ours. We dig up the clam and pull him out of his shell—poor little roll of glutinous matter!—and eat him without remorse. But when the relationship gets closer, and we find the same fibrine clothing the bones of man, we call the eating it cannibalism.

Every time we make a feast a score of lives are taken—lives just as precious to their owners as ours to us. It isn't the eating of the fibrine or the glutin that hurts us, but it is the smothering of mercy and the crushing out of benevolence. The most intelligent minds, the most exalted spirits, those farthest removed from the animal plane, have always had the tenderest regard for animals. It is the true poet of Nature who sees sisterhood in the flowers and brotherhood in the trees. When the plowshare of Burns turned down the daisy he saw the fall of a sister; and when the same share went tearing the nest of a field mouse, he pitied her as he would have pitied a human being.

So sacred has life seemed to some, even among the ancients, that they would eat nothing which had cost any creature its life. There was a school of Greek philosophy, centuries ago, which forbade animal food. Among the Hindoos, at the present time, there are many who never kill a creature however insignificant, but count it the hight of virtuous self-sacrifice to become the prey of beasts. In Siam priests are forbidden to destroy any living animal or vegetable. The Banyans even brush the ground before them to prevent crushing an insect in their path. Hospitals are built for infirm and wounded animals. It's no wonder that Englishmen conquered India so easily. Englishmen living on "rare roast," accustomed to the sight and smell of blood, used to the sight of expiring beasts, found but gentle foes in the land of fruit and rice. The Hindoo respect for animal life arises from a belief that the souls of men, after death, enter into the body of some animal. Other tribes of Southern Asia and Polynesia believe that trees are sacred—containing the souls of men. All these are acknowledgments of relationship, and whatever the source of their religion, it cannot be a bad one if it promote peace among mankind and prevent cruelty to the weaker races.

The intelligence of animals and their companionship with man forms the basis of Esop as well as the philosophy of Greece. There is something attractive to a child in the fancy that animals are persons—that they talk and reason together. Watch children playing with their pets, and you see the recognition of the "poor relation." While we, grown proud and warped, having lost the pure instincts of nature—see in animals only dollars and cents, a good pointer, or a fast trotter. It is the instinct of childhood to treat animals kindly, especially the pet birds, dogs, cats and horses. They are fed and talked to as if they possessed souls, and when they die are mourned with tears and buried with honors. How tender the feeling of that little heart, that, like he who was greatest in the kingdom of heaven, see the love of God caring for the lilies of the field and the birds of the air, and giving them foliage and plumage that exceeds the splendor of Solomon.

But the child that is jerked around by its parents, and boxed and cuffed, and made cruel and combative by example, will treat domestic animals and fellow-playmates in the same manner. It is unkindness to the brute creation that makes us brutal. We come to think that animal life is of little consequence, and then it soon follows that we disregard human life. A man insults you and you strike him down. Once it was the fear of a coward's brand that drove great-hearted Hamilton to meet the traitor Burr, and he was cut down in cooler blood than one would shoot a wolf. Who killed Alexander Hamilton? Whose bullet slew the great-souled Broderick? It was public opinion created by men who cared little for the life or liberty of their fellowmen. And that this indifference to our nearest kin comes along with our indifference to our poor relations is a parent. The sight of blood makes our tender-hearted school girls faint; but the fish-woman who spends hours daily amid the gasps of expiring salmon has no feelings of sorrow for the life she takes. Let our little boys and girls go to the butchers' shambles and get hardened to the sight and smell of blood and see the expiring throes of animals, and soon they will think but little of inflicting pain or taking animal life. And let our men and women look on at a judicial murder, where murderers die "game," and the sacredness of human life is gone. Frequent exposure to such scenes tends to brutalize us. When we consider the act of taking life, or its surrender, how much alike it is in the man and in the beast. Neither wants to die—both will fight for the precious boon. Our poor relations love and cling to life as tenaciously as we do, and since we give them no credit for immortality, we take away all the life they have.

But we see a growing respect for our "poor relations" in the fondness for animal forms in art, especially in painting. Ancient art embraces nothing of the kind. The human face and form was all that was thought divine enough for art. To be sure, they sculptured great griffins and dragons sometimes, but they drew on their terrified imaginations for them – they found no models in nature. Rosa Bouheur, on the contrary, has built her reputation upon paintings of a horse-fair, in which that noble animal is exhibited in every graceful attitude. Another of her paintings is a plowing scene, with the tired oxen lolling out their tongues, and one stubborn fellow pulling back on his yoke, just as obstinate men and women do occasionally. Landseer's painting of the "Dogs in Conrt" never wearies. Prang's chromos are, many of them, animal likenesses, and they are the most charming and attractive of any.

The likeness of men and women to animals is shown especially by caricature. The caricaturist sinks his darts at *man*. The "poor relation" never suffers by the comparison. Its a sort of confirmation of the Darwinian theory. If a man acts like an ass, or a monkey, or a goose, the artist so portrays him, and taking the hint he rises from beasthood to manhood. If a woman talks a great deal of nonsense or prides herself on her plumage, he draws her portrait as a parrot or a magpie, and if she represents modesty far from low things he high, it brings its blessing. No one desires to be thought to resemble our poor relations.

And so we find the claim to kinship follows us alike in the fields of physiological structure and mental faculty. Perhaps it is, after all, but a very superficial covering of clothes and finery that deceives us into the belief that we are men. The creatures we are and associate with, stripped of the covering of conventionalities, would stock a barnyard or a menagerie. The wolves we hunt down for entering our folds are first cousins to those who plunder our treasuries and rob our people under the cover of the law. The ass we load with burdens for the market have no longer ears than we who bear the burdens of oppression and eat the thistles of poverty imposed upon us by giant monopolies. We dare not point to everyday actions—to common-place men—to average standards of intelligence and morality to make good our claim to manhood. It is only when some stout, brave heart, sorrowing for the apathy and suffering of its kind, strikes the keynote of reform that we are lifted from our beasthood to the glorious plane of true manhood.

If a person swallows any poison whatever, or has fallen into convulsions from having overloaded the stomach, an instantaneous and very efficient remedy is a heaping teaspoonful of common salt, and as much ground mustard, stirred rapidly in a teacup of water, warm or cold, and swallowed instantly. It is scarcely down before it begins to come up, bringing with it the remaining contents of the stomach; and lest there be any remnant of a poison however small, let the white of an egg, and sweet oil, or butter, or lard—several spoonfuls —be swallowed immediately after vomiting; because these very common articles nullify a larger number of virulent poisons than any medicines in the shops.

Correspondence.

LET'S SWAP.

Ed. Agriculturist: The oft-returning real or fancied corner in coin that so vexes those that are short of the article suggests the question, Do we not use more coin than we need to? If one-third of the business of the country could be done without recourse to banks or coin, it would relieve the pressure on the other two-thirds of business transactions. Many of our boss mechanics could receive several tons of wheat from their customers who produce it, perhaps flour it at a mill owned by another customer, and deliver it to their workmen at the same, or less, price than they pay for flour at retail. A hundred weight of nice salt pork, delivered to a laboring man at the producer's price, would be far better for all parties than the same amount of pork bought by the "four bits' worth," at retail price.

Nearly all the productions of the country that are consumed in the country could be handled without handling cash. Even the little bill due the editor of the family paper might be settled to his satisfaction with some of the farm or the shop productions, and an extra sack of something put in would send the paper to fathers, brothers or friends "in the States." [That's so.—Ed.]

Many family men who work in the harvest field might profitable receive at their doors, before rains set in, a half ton of flour that would count them even better than the coin that the ranchman has with difficulty obtained for them. If every ranchman in the country could pay one hundred dollars of harvest expenses without recourse to coin or banks it would make a noticeable relief of the usual harvest pressure.

The operatives in many Eastern manufactories would be very glad to get a car-load of canned fruits, flour, etc., from California and return goods to balance the account. The sections with which we exchange but little are sections whose *workmen* we had better import rather than their goods. Wisconsin and Michigan wagons had better be made in California. Let us "trade most with those that trade most with us."

It is, or ought to be, for the interest of bankers and mechanics that the people flourish. One well-fed, fat, spirited team, though *harder to drive*, is worth more to a ranch than a dozen submissive, half-starved "crow baits."

C. A. W.

Cozy Nook, July, 1876.

THAT "MATTER OF POLICY."

Ed. Agriculturist: Mr. O. L. Abbott, in a letter published in your June number, calls you ta task for republishing a "blue" account of bee-keeping in San Diego. I had read the "blue" account with much satisfaction, feeling sure that though "blue" it was also true.

We are told by that prince of physicists, Tyndall, that blue waves of light are far smaller than red waves; these latter, consequently, would pass through media impervious to the former.

Now, Mr. Editor, it seems to me that the eye of your California journalist contains some film that checks the blue rays. Blue never disturbs the equanimity of his optic nerve. The yellows and greens of jealousy occasionally tinge his pen, but rose is the color he delights in. Whatever tint is visible to the ordinary eye, the journalistic eye sees but rose.

To those who live in California, and understand this little peculiarity of literature, no harm, perhaps, accrues; but to outsiders, who are seeking whither to emigrate, a great wrong is done. There are annually hundreds, if not thousands, who come to this State misled by overcolored statements of facilities to be enjoyed here in making homes and acquiring farms. They are families of small means, and are led to expect that on arrival they will be able to obtain a quarter section of Government land, fit for the plow, at Government price. These expectations are derived from a perusal of the aforesaid literature. I do not say that any special pamphlet or journal states it as an express fact that farming lands in healthy localities can be had at $1 25 per acre, but the reader of current journalism is led to infer that such is the case. The *Bulletin* lately blamed the Chinese for keeping thirty millions of acres of public land unoccupied. Had they blamed Nature for forming rough chapparal hills of dry, hard grit, quite uninviting, as the San Diego bee-keeper found them, they would have been nearer the truth—a "blue" truth, though.

The copy-book still instills into the youthful mind that "honesty is the best policy," and I am prepared to back the copy-book against Mr. O. L. Abbott. I maintain that the immigrant who comes to this State induced by dishonest representations is a positive detriment to the State. He is apt to become a public burden while here, and to return home to disseminate a far "bluer" opinion of California than the clear truth warrants.

It would be well if all intending immigrants could be advised that ordinary farming land ranges in price from $25 for unimproved, to $300 for well-located and improved, per acre; that crops are very precarious on account of drought, especially in inland counties; and, finally, that "all this fine talk of our destinies is, half of it, ignorance, t' other half rum."

A little less trumpeting, gentlemen of the press. Let another man praise thee, and not thine own mouth.

Edw. Berwick.

THE INDEPENDENT PRESS.

by a. g. s.

Editor Cal. Agriculturist: You will please accept the friendly greeting of a once active typo brother, now for some dreary years prostrated by calamity and laid on the shelf of helpless retirement. An editor is apt to find a "hard road to trabel," especially if he ventures to run a sharp and forcible reform journal, against the raging tide of money power and popularity, amidst the fogs of party and sectism, ignorance, prejudice, antiquated custom, and old Madam Grundy, and he naturally craves the sympathy of his fellow-craftsmen and of all high-thinking minds. Who can be independent? It takes a hero in the type wilderness, as well as with the plow to break the grubby field, and no puny or timid hand can ever accomplish great things. Realizing this fact, you have probably counted the cost, and made up your mind for a manly struggle and a valiant battle.

The newspaper is a universal necessity, if Hottentotism is not the settled law and gospel; and wherever you find refinement in society, with mental development and moral rectitude, and external polish and attraction in houses and lands, you may be quite sure the smart newspaper is scattered freely around. And, furthermore, if new departures are opening up, it is pretty evident that the audacious and truth-telling editor is making things hot, and shaking up the dry bones of old fogyism and bloated upper-tendom. So, all the working class, who are proud of themselves and their country, and ambitious to shine and excel in the elements of true civilization, will be proud of your paper and subscribe liberally and write abundantly. Come on, then, come on! Your clean columns, unclocked with party tondyism and cowardice and selfish compromise, will welcome and encourage a free and fearless correspondence, which should characterize all American journalism in the glorious Centennial year.

I place the newspaper always at the very head and front of every public enterprise and institution; and, say what you will of professions and professional men, the newspaper ranks far above them all, in whatever department, because it includes and represents them all. It is, indeed, the brains of the world condensed—a real schoolmaster and mighty educator in every family.

Wonderful upheavals, evolutions and revolutions are marking our time with the convulsive throes of regeneration and a new birth, social and actional. It is the era of labor, and the toiling classes, everywhere, are called to dignity, honor and self-respect. The workers are included in the common household and brotherhood, and will therefore not be long content to stay out in the cold, or in the hot sun, but must claim each his full and just share in the noble strife, the victory, and the glory.

Human toil is no longer classed with the forced draft of the horse and ox, but is the voluntary choice of the highest manhood, which scorns the sneers of haughty wealth, pride and ignorance, and stands up independent — making *labor*, not money, the enduring cornerstone of all government and society, and the chief virtue of all politics and religion.

Workingmen and women produce, and should claim, all that kings or Belknaps steal, eat, wear and waste, and it is about time for the pennyroyal blood of money aristocracy to step down and out. All the world belongs to the workers, and the newspaper is their speaking trumpet, with co-operation for the mighty password! Common sense in everything will lessen taxes and increase our well-being. Support the voice and the press that speaks in your behalf. Your own independence demands the independent journal. Support it, dear toiling brothers and sisters, as it labors for you.

Champlin, Minn., July, 1876.

A CALIFORNIA LAND TRANSACTION.

An Open Letter to the Hon. Mayor, Council, Voters and Tax-Payers of the Pueblo San Jose and People of California.

Cozy Nook, July 1st, 1876.

I take the liberty to address you from, and in behalf of, an afflicted community. I do so with some confidence, as circumstances have placed me in a different (I cannot say at present whether better or worse) position from most of my neighbors, for I never bought the "city title" to my place.

The situation, as I understand it, is this: Some ten or twelve years ago, a number of industrious, enterprising men who had seen too much of land grants and land renting, found what they believed to be a lot of Government land, in the mountains about eighteen miles from your beautiful city. The land was difficult of access, and as a whole poor in quality. Believing their title would be sure, and under the homestead law, very cheap, they had the courage to face the difficulties and go to work to make themselves homes in the mountains. The difficulties were even more than they anticipated. The grizzly bears killed their stock, and the smaller animals made fearful inroads on their poultry. The wild Spanish cattle and horses tramped and destroyed their grain. The State, county and district taxed them on the full value of their homes, and for some time they received little or no benefit from the school and road funds. An amount of hard work that nearly bankrupted many settlers was obliged to be done to get an outlet for wood, coal, etc., the case being such that the county could do but little on the roads.

About the time the roads could be used, the city of San Jose was supposed to have obtained title to the land, and a man who believed he had some rights to the land made application for the whole tract of 7,000 or more acres. His application, although refused by the council, obliged most of the settlers to buy the "city title"—the settlers receiving for their money one of California's most nauseating institutions, a "quit claim" deed.

The settler's lot had been hard work and poor pay, consequently there were about as many mortgages to record as deeds. To men accustomed to prosperity, the interest on the mortgages, added to their already heavy load, would have seemed unbearable, but there is a great deal of hope accompanying large hearts and strong hands, and the settlers were getting much attached to their healthy homes. The wild animals were fast disappearing in answer to the crack of rifles that wasted very little lead; the roads and school privileges were much improved, and better times seemed near at hand, when, to the consternation and disgust of all the settlers, a U. S. Deputy Marshal appeared and served them with papers issued at the instigation of what I once heard called "The San Jose Land Company," but usually known by the pungent term of the F— T—s. Prompt and honorable action on the part of the Pueblo authorities saved many from loss by this annoyance, as the case was very promptly thrown out of court; but the decision was not soon enough to save many from buying another "quit claim" to keep their title clear enough to satisfy the owners of the mortgages.

And now, after ten or more years of struggle, comes the "kill or cure" of the settlement, in the shape of a Spanish grant called Los Huacas, which seems to have permanently and wholly swallowed up Government land, city title, F. T. claim and all. But the owners of Los Huacas offer a tonic called a *warrantee deed* instead of another quit claim, and very considerately agree (in articles of agreement given to many of the settlers) to take any bonds of the Pueblo San Jose that may be issued by the city to recompense settlers who had paid the city *something* for nothing, said bonds to apply as credits on articles of agreement given by Los Huacas owners to settlers.

It is these lands I have in view as I write you, and I have made the statement much longer than I would had I not known that many just and honest voters and tax-payers of San Jose were not acquainted with the facts in the case.

I am told San Francisco was compelled by law to refund in a similar case.

The most profitable part of "going to law" is usually the part swallowed by "those who manage the case" for the contending parties, and I believe there is too keen a sense of justice, too true a business economy, too much laying out for future prosperity in the people of California's most beautiful city for them

) think for an instant of avoiding an onest obligation by legal dodging.

Please allow me to state a few reasons hy I think it is good policy to issue nd show intention to issue these bonds s promptly as possible.

It is right, and *right* is always No. 1 ood policy.

A large share of the settlers are more r less indebted to the merchants and lechanics of San Jose. Whatever brings elp to the settlers, brings pay and increased custom to the city. For the city) do justice to the settlers, is but for ne hand to put money into the other.) has been observed that a mountain ettlement once broken up is hard to re-ettle. The old settlers are strongly at-ached to their homes. They take in ousands of dozens of eggs and pounds f butter to trade with San Jose for oods, etc. Nearly every dollar earned y this settlement goes directly to the usiness men of San Jose.

You have all heard of the goose that id golden eggs for her master. You nbutiess remember her tragic fate and er master's disappointment.

This settlement, once broken up, will) very likely to become a sheep range, ad the profit on a range is about as apt) be spent in San Francisco, New York, · Germany, as in San Jose. Seven ousand acres of sheep range will bring it a small part of San Felipe's present ade to San Jose.

We have now good roads, and a No. 1 rosperous school; many settlers have nquered from obstinate nature a small ot for an orchard and grrden, and early every man, woman and child not flicted by hereditary disease or accident in the best of health.

The city's bonds for principal paid, ad a fair rate of interest, will do much rwards lifting the, at present, unbear-ble load of debt that has been coiling, ke an anaconda, around our hard-work-ig community. There may be obsta-es in the way of the immediate issue f the bonds, but where as capable a ommunity as yours feels a *will*, they ill certainly find a *way* to ease the pres-ure, if not to remove a part of this rushing strain before January 1st, 1877, nds many flying homeless through pace, like pumpkin seeds from between giant's thumb and finger. God grant nat any that may be squeezed out may ght on, land take root in more genial oil covered by peace titles!

Most honorable Mayor, City Fathers, nd influential citizens, may this settle-ient still exist and pack eggs to your ively city?

Most respectfully and kindly,

Yours, Chas. A. Wyman.

LETTER FROM KERN COUNTY.

Panama, Kern Co., July 9, 1876,

Ed. Agriculturist: I have had to almost leave off all letter-writing, because f the press of work consequent upon tarting a new place. Making ditches nd breaking land put planting so far ehind that now, when we ought to be ating green corn, mellons, tomatoes, tc., they are only half grown. I have ast harvested the few

ONIONS

lanted for home use. They did finely; ome weighing from 1½ to 1¾ pounds ach, and were grown on moist land that eeds no irrigation. Many of those on he moistest part of the land sent up a talk and made sets again. Will they be ood to plant? I think they will be more nclined to go to see again.

[Such buttons as are produced the ame year the buttons are planted are not ood to plant for onions, as they will be likely to go to seed again the same way. Only such buttons as are grown from selected onions—perfect bulbs grown one season and transplanted the next to produce buttons—should ever be used for planting.—Ed.

POTATOES.

Early Rose potatoes produce well and do not incline to rot. Early Goodrich, the same. Peerless produces fine tubers and are keeping well; on hill weighed 3¾ pounds; all large. Early Ohio has proved a failure for two years. New York Late Rose has not done well, and rotted badly. I have Burbanks, Dunmore and Excelsior yet to dig. Brinnell Beauty has not yielded well.

Pie-plant roots, seedlings, set late last spring have furnished some good stalks for pies. It is going to be a success here.

I set one Houghton's gooseberry bush last sprnig, and it produced a full crop of fine fruit. It seems as if almost everything will grow upon this Island.

DAIRYING, ETC.

Good alfalfa hay can be had in the field for $4 per ton, or $5 in stack, or give half for cutting and putting in stack. While butter is 37 cents per pound, and cheese 16 cents, what a chance for dairy business.

This is the best place I have yet found for a poor man who is willing and able to work, for there is no time of the year that he cannot be planting some crop. Our worst trouble is the rabbit; but a petition is being circulated now to have the county pay five cents for each pair of ears, and if they decide to do that, it will thin them some, as parties can take off the ears, then ship the rabbits to San Francisco, and thus get 60 cents per dozen over those from other places. Many have been killed with phosphorus, which the farmers are putting out, mixed with shorts or corn meal.

We are still planting corn; have heard of good crops made as late as July 13.

We are testing the banana here. We received six plants the other day, which are in the hands of three different parties for trial.

I am too tired to write a letter; can only jot down ideas for you; may send send more such notes in the future if you like them. Yours, J. B, R.

[We would like to get such notes from every district in the State.—Ed.]

A WORD OF CAUTION.

Santa Clara, July 12, 1876.

Ed. Agriculturist: In this hot, dry country, is it not wisdom and economy to supply every means in our power to avoid destruction and ruin by fire? Steam threshers are excellent, it must be admitted, for threshing grain; but they are also very destructive. Would it not be well for the farmers if the manufacturers would attach a force-pump that could be thrown in and out of gear in a moment, and be driven by the engine, also a piece of hose to direct the stream? And, further, I would advise to have ready about six pails full of water, in case the pump should fail to work properly. Farmers are very apt to say there is not much danger; but there is, nevertheless, and wisdom says, Prepare!

I have received many valuable ideas from your interesting and instructive little paper. Please accept this poor one in return. Yours, respectfully,

Geo. M. Brown.

Stack your straw. Somebody's stack will want it if yours does not. Its actual value is one-third that of good hay.

Pisciculture.

Concerning Fish and Fish Culture.

SHAD in the Hudson river had become nearly extinct until the Fish Commissioners of New York caused it to be stocked with 100,000,000 per year for several years; the consequence is that they have not been so plentiful and cheap for forty years as now. The rascally pot-house netters, however, take every opportunity to stretch their nets surreptitiously across the third of the stream reserved to let them come up the river to spawn. Seth Green, that veteran pisciculturist, is now stocking the river with sturgeon in immense numbers, that in a few years will go through their nets as if they were a piece of gauze. The Hudson river sturgeon grow to an immense size, attaining frequently to the length of ten or twelve feet, and weighing from four to five hundred pounds.

Another gratifying practical result of fish planting is that in the Potomac where black bass were entirely unknown until it was planted, they are now caught in strings of from thirty to sixty, weighing from two to four and a half pounds, in a day's fishing.

This breeding of fish and stocking all the inland lakes and rivers is simply a question of food for the people, as much as raising grain, beef, pork, etc. The United States make an annual appropriation of $30,000 to procure fish from foreign waters which are unknown to us, and to change the breed of such as we have, which is as much required as to change the breed of everything from the human race to potatoes. Almost all of the States have now efficient fish laws, and very many make liberal appropriations to stock all the public lakes within their borders, under the supervision of their boards of fish commissioners, as well as the rivers. Canada does the same.—*Cor. Chicago Journal.*

Gold-Fish.—"How beautiful!" she exclaims, as she stands gazing at my window, in which is hanging a globe containing a couple of ruby gold-fish.

"Such a lot of time and trouble it must take to keep them!" declares her companion, at the same time gazing with admiring eyes on the brilliant golden beauties as they float, dive and execute the most indescribable twists and turns in their crystal palace.

"Yes," replies the first speaker, with an audible sigh, "if I could spare the money, but you know—" And she metaphorically clasps her purse, and with heartless inconsistency turns away from one of the most beautiful of God's creation, and orders that "love" of a bonnet, which you know to cost nothing less than $25.

Dear, oh dear! When will we learn to discover the true and the beautiful? When will we sppreciate the wonders that He has created and discard the hollow mockeries of to-day? But it is not for me to moralize, and so to my subject.

The first thing, after decided to keep fish, is to purchase a globe; mine held about three quarts and cost the enormous sum of $1. The globes may be obtained of any establishment selling chinaware. Be sure and ask for French plate glass; examine carefully, and refuse those containing flaws or irregularities. If you cannot afford a globe, or wish to experiment, you can procure one of those old-fashioned wide-mouthed candy jars.

The fish, costing twenty-five cents each, you can get of any bird-fancier. Lift your eyes from the tantalizing beauty of the large fellows, and select two not longer than three or three and a half inches. (I am supposed to be stocking a globe holding three quarts of water.)

Take a quantity of silver or common white scouring sand, and after thoroughly cleansing in several courses of water distribute it on the bottom of the globe to the depth of an inch. Filling the vessel to within half an inch of the top with fresh river water, sink in the sand several or as many pieces of water plant as your fancy and good judgment dictate, tate, being careful not to crowd the globe and thus impede the free motions of the inmates.

Any pond or running stream contains numerous varieties of delicate water plant, which is absolutely necessary in your globle. Sipa or cuttigs, when fastened in the sand, will soon send out their lovely little branches, adding greatly to the beauny and cleanness of your globe, as well as to the sustenance and longevity of the gold-fish.

Several tadpoles—these are the best of scavengers, and of course are necessary —a dozen of water-annils, and one or more "duce," will make your outfit complete, and one of which you will never tire.

We have now come to the most important part of our subject, namely, food. Garden worms, not more than three at one time, cut in fine bits, are greatly relished, and indeed are their chief food. Fresh beef in winter is a good substitute. Bread is not at all deleterious, as is a too common supposition. As fresh water contains any number of animalcules, never feed your fish oftener than once in two weeks; and when you think their appetite has been appeased, you must change their water.

It is a never failing sign when the fish will persist in floating around the top in search of air that the water is impure and the globe needs renewing with fresh water.

Never let the fish hang for any great length of time in the sun, and once a day if possible, let the cool air upon them. When it is desired to change the water, the inmates must not be removed with the hands, but with a simple little net made of any thin material.—*Harper's Bazar.*

The Distribution of Fish.—Statistics of distribution for the years 1874 and 1875: Shad, 18,689,550; Penobscot salmon, 2,294,565; California salmon, 5,-153,740; total, 26,137,855. To this is to be added the hatching and distribution, during the spring and winter of 1875-6, of California salmon, Penobscot salmon, land-locked salmon, and lake white fish, not yet completed, but amounting to at least 14,000,000 fish; thus making a total of 40,000,000 supplied by the United States Fish Commission in three years. This, at the assumed ratio of 1 to 200, would represent the proceeds of 8,000,-000,000 eggs laid in the natural way and subject to all the especial perils of natural spawning.

The little salmon will be ready to go into the large rivers about the middle of December, when fresh water fish that might otherwise devour them, will be in a state of torpidity; and when the warm weather comes will be acclimated and able to take care of themselves.

Mr. Ccp married Miss Fish, in a Connecticut town, the other day. The affair passed off swimmingly, and terminated in a Cod-Fish ball.

SETH GREEN, the noted sportsman and fish culturist, in the *Forest and Stream*, makes what he considers a very important suggestion to trout fishermen. He says that the most effective hook in fly-fishing, and one which he himself always uses, is made from a strong needle, annealed, bent and tempered, and consequently without a barb. He asserts that only in this way can a really sharp hook be obtained; that the tension of the rod is amply sufficient to keep such a hook in its place, and that a very gentle stroke will fix the keen point in the mouth of the fish.

Porcine.

The Original Breed of Berkshire Swine.

TRADITION, and the earliest published accounts of what has long been particularly distinguished by the name of Berkshire swine, represents them, down to about a century since, as among the largest breeds of England—weighing, full grown, from 700 to 1,000 pounds, or more. The "Complete Grazier" describes one, in 1807, as weighing 113 stone (904 lbs). This was exhibited, with others, by Sir William Curtis, at the cattle show of Lord Somerville, in that year. Johnson, in his "Farmers' Encyclopedia," London, 1842, says that they weighed at that time from 50 to 100 stone (400 to 800 lbs). The latter of these, doubtless, were of the improved breed.

Originally they were represented as being generally of a buff, sandy, or reddish-brown color, spotted with black, occasionally tawny or white spotted in the same manner. They were coarse in the bone; head rather large, with heavy flop ears; broad on the back; deep in the chest; flat-sided, and long in the body; thick and heavy in both shoulders and hams; well let down in the twist; bristles and long curly hair, with rather short, strong legs. Their meat was better marbled than that of any other breed of swine in Great Britain—that is, had a greater proportion of lean freely intermixed with fine streaks of fat, which makes it much more tender and juicy than it would otherwise be. They were consequently, from time immemorial, preferred to all other swine there for choice hams, shoulders and bacon. They were slow feeders, and did not ordinarily mature till two and a half or three years old.

It is thus that I find the Berkshire hog figured and described in the earliest English publications to which I have been able, thus far, to obtain access. But in the second volume of the magnificent folio edition, illustrated with colored plates, now lying before me, of "The Breeds of the Domestic Animals of the British Islands," by Professor David Low, published in London, in 1842, is a portrait of a Berkshire as I have described above, except being of rounder body and somewhat finer in all his points, with ears like most of those of modern breeding, medium in size, and erect instead of flopping. This portrait is of a sandy or reddish-brown color, spotted with black; the feet and legs for nearly their whole length, white, slightly streaked on the sides and behind with reddish-brown. It, of course, represents one of the old breed considerably improved, and marked, as I occasionally found them in all my visits to Berkshire, down to 1876. But the pigs which I saw thus marked were of the same size and shape, and as fine in all their points, as the general run of the black, slate, or plum colors of the present day.

FORMATION OF THE IMPROVED BERKSHIRE SWINE.

Tradition tells us that this was made by a cross of the black or deep plum-colored Siamese boar on the old unimproved Berkshire sows. Other traditions assert that the black and white spotted, and even pure white Chinese boar was also sparingly used to assist in the same purpose. I can well believe this; for I often saw swine in Berkshire spotted, about half and half black and white, in addition to the reddish-brown, or duff and black, and so on almost up to a pure plum color or black. The produce of the above cross or crosses was next bred together, and by judicious subsequent selections, the improved breed, as we now find it, became, in due time, fixed and permanent in all its desirable points.

Another feature, aside from the half and half black and white spots hitherto occasionally found to mark the improved Berkshire swine, which may be adduced in support of the supposition of a sparing cross with the white and light-spotted Chinese, is the shape of the jowls. All those which I have bred in my piggery, or imported at different times direct from China, or have seen elsewhere, had much fuller and fatter jowls than the Siamese. Some of the breeders in England preferred the fat jowls, because carrying the most meat; others the leaner as they said this gave their stock a finer and higher-bred look in the head.

THE SIAMESE SWINE.

In the same volume of Professor Low which contains the Berkshire portrait as described above, is a colored plate of a Siamese sow. She is a dark slate, varying to that of a rich plum color. The two hind feet are white; the fore legs and feet white, shaded in front with plum. The face is dished; head fine, with short erect ears; shoulders and hams extra large; back broad, with a deep round and longish body. This sow is represented with a slightly swayed or hollow back, at which we need not wonder, considering its length, and that she has a litter of nine great fat pigs tugging away at her dugs. These Professor Low says were got by a half-breed Chinese boar, which I presume, from the color of the pigs, was white; for some of them were pure white, white others are mixed slate or plum and white, and one is a buff, with black spots, like the original Berkshire.

I will now describe the Siamese swine, such as I possessed and bred for several years on my own farm. They were dark in color from deep rich plum to dark slate and black; had two to three white feet, but no white on the legs or other parts of the body. The head was short and fine, with a dished face, and rather thin jowls; ears short, slender and erect; shoulders and hams round, smooth and extra large; back broad and somewhat arched, except in sows heavy with pig or suckling pigs, but even then it was straight rather than swayed; body of moderate length, deep, well ribbed up, and nearly as round as a barrel; chest deep and broad; twist well let down; legs fine and short; tail very slender and well set, with a handsome curl in it near the rump; hair soft, silky and thin; no bristles even on the boars; skin thin and of a dark hue, yet when scalded, scraped white; flesh firm, sweet and very tender, with less lean than in the Berkshire. Although so compact, round and smooth in build, they had a fine, high-bred, upheaded style, especially in their walk, which instantly attracted the attention of all who called to see them. They were moderately prolific, and hardy as any other breed of swine I ever kept—the extremes of heat and cold never injuring them. They were gentle in disposition, very quiet, and easily kept, and would partially fatten on good pasture, or coarse raw vegetables. They could be made fit for the butcher at any age; matured at 12 to 15 months old; and when fully fattened, generally weighed from 250 to 300 pounds, and occasionally going to 350, or even 400 pounds. They had very fine bones and light offal.

It was, doubtless, with Siamese boars as perfect as I have here described, that the cross was made on the original Berkshire sows, which has contributed so largely to the formation of the improved breed, held in such high estimation for a full century or more past.

WHEN WAS THE CROSS MADE?

Several aged men in different parts of Berkshire, of whom I inquired on my first visit to England, in 1841, informed me that they had known there improved swine of the same type as I then found them, from earliest childhood. But the most particular, and apparently reliable account I was able to obtain, was from Mr. Westbrook, of Pinckney Green, Bysham, who told me that his father possessed them as early as the year 1780, in as great perfection as the best then existing in the country. Thus it will be seen that the improvement is now at least a century old, and more probably a century and a quarter; for it would have taken some years back of 1780 to begin a new breed of swine, and get it up to a fixed type at that period.

CHARACTERISTICS OF THE BEST IMPROVED BERKSHIRE SWINE AT THIS TIME.

Snout and head fine and rather short, but larger in proportion to the body in the male than in the female, and with a bolder and more determined expression; face dished and broad between the eyes; jowls full or thinner, according to the fancy of the breeder; eyes bright and expressive; ears small, thin and upright, or inclining their points a little forward; neck short, rather full in the throat, and harmoniously swelling to the shoulders; chest broad and deep; back broad and moderately arched; rump nearly level with it; well let down in the twist; body of good length and depth, round with well sprung ribs, and straight along the sides and under the belly; shoulders, above all, in the boar, extra thick, yet sloping smoothly to the body; hams broad, round, deep, and so thick through from side to side, particularly in the sow and barrow, that, standing directly behind, except when pretty fat, the sides of the body are scarcely seen between them and the shoulders; legs fine, strong, of moderate length, and set rather wide apart; feet small, with clear, tough hoofs; tail slender and well set, with handsome curl near the rump; bones fine and of an ivory-like grain and hardness; offal very light in comparison to weight of carcass; hair fine, soft and silky; no bristles, even on the boar; skin thin and mellow, with elastic handling of the flesh beneath; quick and spirited in movement; stylish in carriage, and, in the boar more especially, bold and imposing in presence.—*From Allen's Prize Essay.*

THE July number of the CALIFORNIA AGRICULTURIST is on our table. In amount, variety and quality of matter, indicated by its title, it has no equal on this coast. CAL. AGRICULTURIST PUB. CO, San Jose—$1 50 per annum.—*Catsrocille Argus.*

Don't burn your straw. Stack it.

Entomological.

Combating Insect Foes.

PROF. F. H. SNOW, of the State University of Kansas, tells us how he would make war against noxious insects; in one one of his late educational lectures. He suggests that it should commence with—

1. Legislation to compel every man to keep his grounds free from insect pests. No one has a right to foster noxious agencies for the destruction of his neighbor's crops and fruit.

2. A bounty might be offered in certain cases, by the county, State or General Government, for the capture of injurious insects. A reward of twenty-five cents a bushel for locusts during our recent visitation by this scourge would doubtless have prevented a large portion of the damage inflicted. Such a reward would certainly be as legitimate as the customary bounty for gopher skins.

3. The introduction of parasites should be undertaken by the General Government. Many of our most destructive insects have been introduced from Europe. In the Old Country they have many parasites to keep them in check, but as yet few of these parasites have made their way to this country, so that our foreign foes have proved most destructive on account of the absence of their natural checks. That the plan proposed is a feasible one has been proved by Dr. Le Baron, the Illinois State Entomologist, who has successfully introduced into northern Illinois a parasite upon the apple bark, louse.

4. Every State in the Union should employ a competent man as state entomologist, who should give his whole time to the work of investigating the habits of insects, and disseminating information among the people. Messrs. Fitch, Riley and Le Baron have saved millions of dollars to the great States of New York, Missouri and Illinois, by their indefatigable entomological labors. The salaries paid to these men have been a thousand-fold returned to the States employing them.

5. The legal protection of insectivorous birds. A commission should be appointed to determine what birds are entitled to this protection.

6. The plan proposed for the appointment of a national commission for the prevention of the national calamities occasioned by insects is worthy of indorsement by every farmer and fruit-grower in the land. The petition to Congress for such a commission should receive universal signature.

7. I would finally suggest that if our people were more generally familiar with the subject of entomology, and were able to distinguish between the beneficial and injurious species of insects, our universal enemies would be more intelligently and effectually resisted. To this end I would earnestly recommend the introduction into our schools of the elements of this extremely practical science. Independently of the educational advantages of natural history studies, the "practical" value of a knowledge of plants and insects should forcibly commend botany and entomology to those who determine the course of training in our common schools. If our children were taught to distinguish between their friends and foes in the insect world, a large proportion of the annual loss entailed upon us through ignorance would undoubtedly be prevented. And since the majority of those who attend our public schools will be connected for life with the pursuits of agriculture and hor-

ticulture, it is easy to understand the propriety, and even the necessity, of introducing into the courses of study those "practical" branches a knowledge of which is essential to success in those pursuits.

Birds, Insects and Crops.—It won't do any harm to repeat, for the benefit of our many new as well as old readers, that birds pay ten-fold for all they eat on our farms in destroying insects. An old writer of fifty years ago says, in speaking of the cut-worms, mice and insects, that he erected thirty boxes in different parts of his garden, which were soon occupied by birds, and he found they soon disposed of the enemies of his cabbage plants and vines.—*Rural Sun.*

The Horse.

Nebuchadnezzar.

BY IRWIN RUSSELL.

Yon, Nebuchadnezzar, whoa, sah!
Whar is you tryin' to go, sah?
I'd hab you for to know, sah,
I's a-holdin' oh de lines.
You better stop dat praucin';
You's pow'ful fond oh dancin',
But I'll bet my yeah's advancin'
Dat I'll cure you oh your shines.

Look heah, mule! Better mine out—
Fus' t'ing you know you'll fin' out
How quick I'll wear dis line out
On your ugly stubbo'n back.
You needn't try to steal up
An' lif' dat precious heel up;
You's got to plow dis fiel' up,
You hea, sah, for a fac'.

Dar, dat's de way to do it!
He's comin' right down to it:
Jes' watch him plowin' t'roo it!
Dis nigger ain't no tool.
Some folks dey would 's beat him;
Now, dat would only heat him—
I know jes' how to treat him:
You mus' reason wid a mule.

He minds me like a nigger.
If he was only bigger
He'd fetch a mighty figger,
He would, I tell you! Yes, sah!
See how he keeps a-clickin'!
He's as gentle as a chicken,
An' nebber thinks o' kickin'—
Whoa dar! Nebuchadnezzah!

* * * * * * * *

Is dis heah me; or not me?
Or is de debbil got me?
Was dat a cannon shot me?
Hab I laid heah more'n a week?
Dat mule do kick amazin'!
Dat beast was sp'iled in raisin'—
But now I 'spect he's grazin'
On de oder side de creek.

Treatment of Sick Animals---Cough in a Horse.

THERE has been an internal wound, obstruction or irritation, and the cough is only a symptom or evidence that nature is trying to heal or remove it, and should no more be stopped till the cause is removed than the temporary scab that nature throws over an external scratch should be removed before the wound is healed, when it comes off itself. It matters not whether the wound or obstruction is nasal, laryagital, bronchial, thoracic, or stomachic, caused by dust, poison or overwork, the cough will surely stop when the cause is removed.

No doubt ginger, or other poison, might be more obnoxious to vitality than the injury, and temporarily call of the repair force for its own expulsion and thus abate the cough for a time, but to no greater real benefit than the paying of debts with money hired at a higher rate of interest than that on the debt, which is sometimes, but rarely, expedient, the debtor still has the debt to pay, and "bonus" besides. Not to burden your columns with statistical proofs, I will incidentally give one which also shows that "Light is dawning in the East."

In a recent New York *Journal of Health* containing many useful hints, with "liver pills," etc., its celebrated M. D. proprietor says substantially, "Never try to stop a cough; it is nature's way of removing phlegm from the chest; much better take something to increase the cough," etc.; and also adds that he is the first publishing the (nature cure) doctrine, which was systematized, successfully practiced and taught by lectures by its talented, self-denying and worthy M. D. discoverer, after ten years' extensive allopathic practice, about fifty years ago; and by him practiced till his recent death, at eighty-six, and taught in several excellent works of his.

"Spasms in pigs," "horn ail," mentioned in the same paper (Jan. 29, 1876) and all ordinary diseases, in man or beast, are the most successfully treated on the "nature cure" system; and nothing can be done to help nature, but to remove all hindrances possible and supply all natural wants. Make the patient comfortable and let nature work. Poisons tend to death when taken by well animals, and how absurd to think that their nature is instantly changed so as to tend to life, by being taken by a sick, and perhaps already nearly dead animal. "Like, cause, like effect" is as true here as everywhere else.

In all acute, inflammatory cases, fevers with quick pulse and coated tongue, colds, etc., do not tempt the palate, and give no food unless it is desired in a natural and plain condition, that is, without stimulating condiments. Food in the stomach, uncalled for, is a hindrance to recuperation. Unless there is heat and pain in the bowels, do not disturb them; if there is, pure, warm water enemas, and fomentation are usually sufficient.

Always remember that nature knows her own business best, and don't try to force action with disagreeable interference. Unnatural, stimulating food and drink in an unnatural manner and quantity, have often given "fits" to other animals than voracious pigs, and "urine and soap" are not the natural and best remedy; abstinence, rest and natural food and drink are far better.—*New England Farmer.*

The Horse's Foot.—A competent veterinary surgeon writes as follows on the subject of that all-important part of the horse, namely, the foot:

Most of the horse-shoers of the country prepare the foot, fit the shoe, and secure it to the hoof in the same manner that a wood butcher fits a shoe to an old wood or ox sled. The mechanism of a horse's foot is one of the most wonderful and ingenious structures that can be found in all the works of the Creator. Beneath and in the rear of every hoof there is a frog, which is a tough and elastic pad for preventing injury to the animal whenever he plants his foot suddenly on any hard substance. Large rolls of cylinders of india-rubber are placed beneath the railway cars to prevent injury to any part of the car or to the cargo with which it is loaded. The frog beneath the foot of a horse is designed to subserve a similar purpose. But the manner in which most horses are shod lifts them as it were on short stilts, so the frog cannot perform its appropriate functions.

If we look carefully at the young horse when he is trotting or running, it will be perceived that every foot is brought to the ground in such a manner that the frog receives the powerful blow. By this means all injury to the animal is avoided. Science teaches us to permit the frog to develop and point downward. But most blacksmiths seem to think that the all-wise Creator made a mistake when He formed the foot of the horse. Hence they fail at the frog with red-hot burning irons, with edge tools and with any other appliance that will enable them to remove this extraneous excrescence. Illustrious minnies! Why not shave away all the rough, callous, adipose tissues beneath their own heels, and allow the bare bones to rest on an iron plate inside of their own boots and shoes? No frog, no foot; no foot, no horse.

Horses for Farmers.—For the ordinary American farmer, who cultivates the average-sized farm of about 100 acres, in a variety of crops, a breed of horses is required suited to the heavy work of the farm, the hauling of crops to market, and also possessing the fleetness desirable in carriage horses.

Such farmers cannot afford to keep separate teams for draught and carriage purposes. They want horses which, when hitched to the plow, will move with unyielding strength through sod and stubble, will draw the wagon loaded with grain, hay, corn or roots to the barn or stack, the loaded manure wagon over the soft, yielding earth; that will force the reaper through the stoutest grain, or the mower through the thickest grass; that will move wagons heavily laden with the farm products to market, and at the same time, when the farmer wishes them to get over the ground rapidly, with carriage or light wagon, will be on hand.

Some will say that the farmer has no business with fast horses. If he has not, we should like to know who has. He is generally located miles from his market town, whither he is often obliged to go several times a week, to market, on business, to church or lectures, and he cannot afford to waste much of his valuable time on the road.

The lord knows animals have enough to suffer from hunger, thirst, cold, from beating and cruel and thoughtless owners. They are cut and slashed, burned and blistered without mercy, and still editors will publish every old fogy remedy handed down from our old, heathenish, ignorant ancestors; and more horses have been spoiled by knives and hot irons than have ever been cured by such treatment, and it is time such abominable practices were abolished and a more common sense way adopted. Doctor a horse as you would yourself, and your will find it a vast improvement on the system. If your horse has colic, instead of trotting him around all the time, let him lie still, and cover him with three or four blankets and give large injections of warm water and he will soon be all right.

Intestinal Parasites.—Prof. Cobbold marshals a considerable amount of evidence to show that colic in horses is frequently, in this country as well as in India, produced by ascaris, strongyli, and other internal worms. Over 1,200 ascarides he mentions as having been removed in a post mortem examination of the intestines of one unfortunate horse. It is a pity we have no record of the sensations, the gastric arrangement, the thriftness of appearance of this much-afflicted animal. What an amount of food these voracious vermin must have consumed from the irritated intestines; rolled in masses, as they often are, they must frequently have formed an almost hopeless obstruction. Thankful would that wretched victim be to suffle off his mortal coil.

Breeding from Unsound Horses.—A. A. says, in the *Country Gentleman*, in answer to an inquiry: Several years ago a neighbor of mine owned a stallion that had the stringhalt, and many of his colts had the stringhalt while following the following the mare; many more of them would be troubled with it after they had been used a short time, and I think the colts, when kept to breed from, were more liable to have the stringhalt than those bred from a sound horse.

The Press of the Day.

We should not forget that the press is the greatest educator of the day, and, more than any other instrumentality, gives caste to individual and national character; and we should remember also that this influence imposes a corresponding responsibility upon us. To meet this heavy and far-reaching responsibility, and to make the press the palladium indeed of American liberty, the elevating lever of our advancing civilization, it must have a moral conscience, and an unyielding spine. Its influence and patronage must be withdrawn from the market. It must love the right and determinedly stand by it. It must be used no longer as the tool of demagogues to foist them to office. It must break its league with a remorseless money power, and no longer assist it in plowing its schemes of fraud through legislation. It must turn away from charletans and impostors and refuse to longer recommend them through its columns. It must stand as a faithful guardian of the rights as well as the trustworthy monitor to the minds of the people. And upon the appearance of harm, be it from an open foe or an insidious evil, it must have the courage to give faithful warning to the people, and strike telling blows for humanity and the right. To do this, we shall be called upon to thin out our advertising columns, and for a short time our subscription list may be cut down, and our revenues greatly lessened, so that some of us may have to exchange the quill for the hammer and plow handles, but it will be well; our country will have been saved, and humanity entered upon the ascending note.

We repeat, then, the great want of the American press to-day, is conscience and backbone.—*Oregon Cultivator.*

Science of Money Briefly Stated.

Under the above broad title, the publications of the New York Mercantile Journal Company, (viz: The New York *Mercantile Journal*, the *Dry Goods Journal*, the *Druggists' Journal*, the *Hardware Price Current*, and the *Grocer's Price Current*,) are actively bringing the following apothegm to the attention of the public; claiming that the adoption of the system of finance therein set forth will prevent both inflation and undue contraction, thus removing all liability to monetary panics, such as in years past have so seriously disturbed the entire industry of the whole country and entailed such fearful loss upon all.

"In the interchangability (at the option of the holder) of national paper money with Government bonds bearing a fixed rate of interest, there is a subtle principle that will regulate the movements of finance and commerce as accurately as the motion of a steam engine is regulated by its "governor." Such paper money tokens would be much nearer perfect measures of value than gold and silver ever can be. The use of gold or other merchandise as money is a barbarism unworthy of the age."—*Wallace P. Groom.*

Horticulture.

Gulf Coast Fruits.

TROPICAL FRUITS.

INE-APPLE *(Bromilia Ananas)*. This delicious tropical fruit, which can only be enjoyed in perfection when allowed to ripen on the plant, has been cultivated with considera- success on the small islands and eys" near the extreme south and ntwest edge of Florida, more particu- ly in the neighborhood of Key West. e pineapple plant is very easily propa- ed, comes rapidly into bearing, and y be made a source of very considera- trade and profit when its culture is ended to its utmost limits. It must remembered, however, that it is ictly a tropical plant, not capable of luring even the slightest frost; and t it can only be grown south of lati- de 40°. Properly organized colonies, small communities possessing the uisite capital and energy, could easily ke the pineapple culture, in south and thwest Florida, a certain success; but retofore the remoteness of the most orable localities from all commercial ilities—the difficulties attending trans- rtation—and the almost total lack of cial, religious and mail privileges, ve deterred immigration and operated ry seriously against isolated individual ort in this promising enterprise.

Banana *(Musa sapientum)*, and Plan- n *(M. paradisiaca)*, both ripen their licious and wholesome fruit somewhat ther north, and stand a little lower gree of cold than the pineapple. Wher- er the mean temperature reaches 70° 75° Fahrenheit, the banana and plan- n can be raised very profitably; but se plants will thrive and fruit ripen, h a slight protection, where the mer- ry descends to 45°, or even lower. king this allowance for superior hard- ss, and extending the range of the nana at least one degree north, the eeding remarks touching the culture the pineapple will apply to the very olific and healthful fruit now under r notice. It will be remembered that e great Humboldt calculated that, in proper clime and under favorable cir- mstances, the yield of food from the nana when compared with wheat was twenty-five to one; and he also assert- that no plant grown on earth for hu- n food could at all compare with this rticular tropical fruit in combined pro- ctiveness and nutrition. There is a de field for the profitable culture of e banana on the Gulf Coast of Florida, ere it is a perennial plant, at all points uth of latitude 29°. It also very fre- uently produces ripe fruit much farther rth, as in the city of New Orleans; and metimes, when slightly protected, on e coast of Mississippi, Louisiana and xas, where the plant is very generally ltivated for its highly ornamental ap- arance and beauty. As a sure and re- able fruit-producing plant, however, the nana can only be recommended within e geographical limits above mentioned namely, near the Gulf Coast, and south latitude 29°.

The Cocoa Nut *(Cocos nucifera)*, the ate Palm *(Phœnix dactylifera)*, the uava *(Psidium)*, the West Indian Paw- w *(Carica Papaya)*, the Anchovy Pear *irius caudiflora)*, the Alligator or Avoca- o Pear *(Laurus Persea)*, and possibly her tropical fruits are cultivated to a mited extent, both for use and orna- ent, at the extreme end of the Florida ninsula, in the gardens at Key West id its neighborhood, but as yet, so far as I am aware, none of these fruits have been planted there on a large scale, nor attained any commercial importance.

SEMI-TROPICAL FRUITS.

Sweet Orange *(Citrus Aurantium)*. This almost universally-known and favorite fruit ranks deservedly at the head of this list, and is worthy of far wider and more careful culture than it has yet received among us. We can cultivate successfully every variety of the sweet orange known in America; and it is an important and noteworthy circumstance, that the seeds of the sweet orange from the West Indies, Southern Mexico, and other tropical countries, when planted on the Gulf Coast produce fruit far superior in size and flavor to that which we import from those countries or from Europe. This now well-established fact, and the ease and certainty with which fine native seedling orange trees can be produced, should encourage our people greatly to extend the propagation and culture of this noble fruit—this "golden apple of the Hesperides"—to its extreme northern limit. I find it quite difficult to define these limits with much accuracy; having seen and eaten fine oranges grown on the Atlantic coasts of South Carolina; in the northern interior of Florida; near the southwestern edge of Mobile Bay (north of latitude 30°), and at all points along the Gulf Coast, from the border of Alabama to Galveston, in Texas. The immediate shore or margin of the Gulf Coast—the islands of the Gulf sufficiently elevated to escape overflow and protracted submergence in severe storms; and the banks of the rivers, bays and bayous emptying into this great Gulf of Mexico, embrace thousands of acres perfectly adapted to the culture of the sweet orange and many of its congeners. Throughout the whole of our mild and pleasant coast country, there are numberless locations yet unoccupied and easily attainable, where almost the entire *citrus* family; from the delicate little Mandarin to the huge Shaddock, may be raise in great perfection, and with nearly as much certainty of a regular crop, as any other variety of fruit which we cultivate. It affords me much pleasure to assure the Society that the propagation, growth and culture of this most interesting and profitable family of fruits is steadily increasing from year to year; and has of late only been retarded by the great and peculiarly embarrassed condition of our section. The variety of orange most in favor and cultivation with us has generally been raised from seed, either native or foreign, and is designated and known as the Creole orange. We have also in cultivation, to a limited extent, the Brazilian (*C. Braziliensis*), the Mandarin (*C. nobilis*), the Tabasco (*C. Mexicana*), the Seville (*Brigaradier*), sour or bitter, the Shaddock (*C. decumana*), the Pamplemousse, the Myrtle, and a few other varieties. Of these, the finer sorts of Creole seedlings, the Mandarin and the Brazilian (all sweet), are undoubtedly the best and most profitable; though the most of the other sorts mentioned are valued for special purposes.

The Lemon (*C. Limonum*), the Lime (*C. Limetta* or *acida*), and the Citron (*C. medica*), are also grown to a limited extent; but all these are less hardy and vigorous than the different varieties of sweet orange, less in demand and, therefore, not so desirable.

Japan Plum (*Mespilus Japonica, Loquat, Eriobotrya*). This tree is a broad-leaved evergreen of strikingly beautiful form, and fine, free habit of growth. It is very attractive and lovely in foliage, and produces an abundance of deliciously fragrant flowers in late autumn and early winter. These, if not injured by frost (which rarely happens south of latitude 30°), are followed early in the spring, from last of January to middle of April, by profuse clusters of fruit, the size of a large plum—juicy, sub-acid, refreshing, and altogether delightful and unique in flavor and quality. This fruit may be gathered four or five days before it is fully mature—will ripen perfectly in the house or *in transitu*; and, if it were largely planted, in proper localities, could be made a source of very great profit. The most favorable localities seem to be in the vicinity of New Orleans, ranging from twenty to thirty miles above to sixty or eighty miles below the city, on the Mississippi river coast, and thence south and southwestwardly, throughout the entire region lying near the Gulf, between the great river and Eastern Texas. The Japan plum is said not to succeed well in East Florida, but I am at a loss to find any good reason for its failure there. Within the particular limits I have mentioned, and even as far east and north as Pascagoula Bay, on the Gulf coast of Mississippi, this attractive and very desirable fruit tree bears a crop three or four years out of five, and is generally grown on a limited scale, both for use and ornament.

Fig (*Ficus Carica*), What the apple, the currant, the strawberry, the Concord grape, and other every day household fruits of the easiest production are to the people of the North and West, the fig most emphatically is to us of the Gulf Coast, *the* "fruit for the million!" It grows from cuttings as readily as the grape or willow; these cuttings often producing a few ripe and edible fruit the first season, and (with proper culture) nearly alwas the second year. The tree seems subject to no disease whatever—is seldom seriously injured by frost; and, when two or three years old, always bears two, and sometimes three crops of fruit during our long season. This fruit, fresh, is of the most delicious, nutritive and wholesome quality; and may, when fully ripe, be eaten directly from the tree, or prepared for the table in many attractive forms by the skillful housewife. It is, however, mainly of the fig as a marketable and commercial fruit that I here wish to say a few very particular words. Assuming that the production of this fruit in our section, so far as quantity is concerned, is practically without limit, our next consideration is, how to preserve it in such a manner as to admit of long and safe keeping and distant transportation. Up to the present time, the fig, so delicate and perishable when fully ripe as to almost preclude the idea of handling or shipping at all in its "fresh" state, has only been cultivated and prized for home use and immediate consumption. It is true a few attempts have been made to dry figs in the sun; and our tasteful house-keepers have prepared fig preserves, pickles and confections, in many attractive forms; but thus far, with the honorable exception of one firm in the city of New Orleans, no one within my knowledge has attempted to utilize this fruit on a large scale, or render it an article of commercial importance and great profit. I think I hazard little in saying now, however, that what cotton was before the day of Whitney and his gin, the fig has been until the successful advent of Bulkley, Alden and other inventors of fruit-dryers and evaporators. I fully believe that the problem is very near its solution—that this excellent and most prolific fruit will soon assume its rightful importance among us; and that before many more meetings of this Society dried figs of Southern production will be found plentifully in our markets, and prove an important and acceptable addition to our home luxuries. The dried fig being the only form in which this wholesome fruit has heretofore been offered to the general public, it may not be inappropriate to say that our figs can also be very successfully pickled (sweet or sour), preserved in syrup, candied and crystalized in sugar, and put up in many other attractive forms and ways. All varieties of the fig, thus far tried, succeed perfectly on our Gulf Coast; and reckoning upon the value and efficiency of the most improved fruit-dryers and evaporators, there is no fruit which can be grown in our section that offers a surer or more liberal return for a moderate expenditure of capital and labor.

Pomegranate (*Punica Granatum*). This graceful and beautiful fruit tree thrives everywhere on the Gulf Coast. Of the fruit-bearing we have three or four varieties, and at least as many ornamental sorts. Both fruit and flowers are very beautiful and attractive, and the pulpy seeds of the former, when prepared with sugar like the northern currant, furnish a juice sweet, cooling, refreshing and agreeable, especially in the sick room. This juice is also used for jellies and conserves, and has often been made into a delicate and peculiar wine. The thick, leathery rind, or outer skin of the fruit, and the bark of the roots, possess very marked astringent and anthelmintic properties, and have frequently been used in medical practice with good results. The pomegranate, however, aside from its great beauty, and the uses to which I here advert, does not possess much attraction as a popular fruit for the market or dessert; and can only be recommended for limited cultivation.

Olive (*Olea Europea*). We have several varieties of the olive, including one wild, native sort (*Olea Americana*), a pretty broad-leaved evergreen, bearing a small fruit of no value. The European olive tree grows freely and luxuriantly, wherever properly planted and cared for; but its fruit production is not generally satisfactory. The dry uplands and rocky ridges of the interior are, doubtless, better adapted to this fruit than the low, moist, sandy lands on the coast; and, as the olive can resist a much lower temperature than the orange, it may be tried successfully in the more elevated and hilly portions of our Gulf States.

Jujube (*Zizyphus sativus*). This tree is a native of Syria, but flourishes everywhere on the Gulf, and as far north and east as Raleigh, North Carolina. The tree is of medium size—sometimes twenty or thirty feet high—with alternate and singularly tortuous branches, armed with long, curved thorns, and having very glossy and beautiful dark green leaves (deciduous). The fruit, which ripens in July and August, is about the size and shape of an olive; and of a sweet and pleasant taste, somewhat similar to that of dried dates. There is little doubt that the Jujube (sometimes called Jujeb) is the true Libyan Lotus of Herodotus, 4, 177, and that it is also described as the Lotus by Pliny, among the ancients, as well as Shaw, Desfontains, Beechy and Park, among modern travelers. It is the Seedra, of the Arabs, and was formerly much cultivated in Southern Europe, and the fruit use for the making of a mild kind of wine or mead, and the well-known jujube paste. Of late years, this once popular confection has been replaced by a cheaper preparation of mucilage and sugar, and the culture of the fruit has greatly fallen off. It is a very pretty and attractive fruit tree and deserves a limited share of attention.—*Extract from address by D. Redmond before the American Pomological Society*, 1865.

The Centennial.

A Look at the Centennial Exposition.

A wonderful collection of the products of human industry and art is now open to the world's inspection at Philadelphia. We have seen most of the great exhibitions in Europe since 1852, and we do not hesitate to say that this display by far exceeds them all. It is not, however, intended to state that in every particular the Centennial excels; for in works of art, in the number of rare paintings, and in statuary, it is comparatively weak; but in the display of mechanical devices, textile fabrics, products of iron and coal industries, chemicals, agricultural products, etc., it is far in advance. And we are not alone in this view. Our visitors from other countries, those who express candid opinions, fully coincide in the estimate we have formed of the display. Its magnitude is immense, the variety bewildering. As regards expense, it will be safe to say that the cost of cases and devices and appliances for the display of articles by exhibitors cannot be less than two millions of dollars, and it may be twice this sum. The costliest woods, metals and glass are used which the world can furnish, and the most skillful artisans have been employed in planning and constructing these receptacles for the thousands of curious and wonderful substances and devices brought together. No estimate can be made of the value of the exhibits, even approximating towards the truth; but the wealth in kind is unquestionably larger than was ever before brought together.

The natural products, the industries, the inventions of our country are represented as they never were before, and it is the first time they were ever fairly brought in contrast with those of the Old World. The international contributions are unexpectedly large and complete, and it is gratifying to know that every civilized nation on the globe, with three or four exceptions, is represented. Greece does not appear, and there are several of the petty South American states that occupy no space. England would naturally be, next after us, the largest exhibitor, and it is apparent to every one that she is. The mother country has done grandly in her display, and has sent to her children in the west a vast amount of her industrial and art treasures for examination and study. Every step taken through the large space occupied by England brings the visitor to new objects of wonder and delight, and thousands every day linger around the well-filled cases in this department. The French, Belgians, Germans, Russians, etc., all do well, and their products individually are worth a visit to Philadelphia to see. So fully have the nations of the earth responded to our invitations that it is impossible in the space at our command to allude to even the prominent articles which are open to inspection. Not only the leading nations of Europe command our attention, but those of Asia, Africa, South America and Australia. Even so far-away and little-known countries as the Orange Free State in Africa, and Tasmania in New Zealand, have joined in the grand concourse of nations The Sandwich Islands make a most interesting display, especially in their volcanic products. We have never seen more wonderful specimens of lavas, sulphur, and natural crystalline substances than are here arranged.

It is impossible to repress a smile as one passes into the Japanese department. They are unquestionably among the shrewdest and most ingenious people in the world. They have brought to the exhibition some of the most delicate and beautiful bronzes and lacquered wares ever made by human hands, and they have done this, not only to gratify a laudable national pride, but also with an eye to business. They seem to us to be a people wonderfully self-reliant and intelligent, and fully ready to open up to trade the great American markets. In connection with their exhibits, they intend to "open shop" outside the grounds and doubtless a thriving business will be done. The Chinese surprise every one with the extent and richness of their display. In elaborate and skillful carving in wood and ivory they lead all other nations. Their department is now fully opened, and visitors are inclined to linger long among the extraordinary products of Chinese skill. The Russians have been tardy in arranging their articles, and at the time of our visit their section was in a state of confusion. Enough, however, was open to indicate the unsurpassed richness of the malachite goods which they have brought to the exhibition. But it is not our purpose to enter upon any extended statements regarding the exhibition in general. Almost every newspaper in the country has its special correspondent at Philadelphia who, during the summer, will describe in detail all the wonders of the exhibition so that every reader will be fully informed.

If any one supposes that the Agricultural Department of the great exhibition at Philadelphia is devoted solely, or larg-ly, to a display of agricultural implements, and that the eye of the visitor is to be wearied with piles of freshly painted mowers, harrows, plows, etc., he is greatly mistaken. We regard the agricultural building, with its contents, as one of the most interesting of the group, and alone it is worth a trip to Europe to see. Every live, intelligent farmer in the country should contrive in some way to visit this display. More can be learned by a careful study of the seeds, plants, tools, agricultural products etc., which are here brought together from all parts of the world than in any other way. A farmer in middle life will find enough to supply food for thought for the rest of his days.

The acres of area covered by the graceful roof of the agricultural building are laden with the fruits of the earth from every clime, and the elegance of the designs of cases, rooms, etc., and the costliness of the products, astonish every visitor. Take the display of the single State of Iowa, under the management of James W. Fulton, Esq., of Fairfield; what a vast variety of wonderful products is here brought together. The fruits are all represented in wax, and are exact models of fruits produced in that State last season. These wax fruits are works of art in form and coloring. The seeds are shown in vast variety; enormous stalks of the cereal grains, with the golden ears of corn hanging in ponderous masses from the walls afford a pleasant sight to the eye, and the collection affords a complete exhibit of the earth products of that garden State. The same may be said of the exhibits of the other States and countries.—*Boston Journal of Chemistry for July.*

CENTENNIAL OF THE AMERICAN REPUBLIC.—Henry Channing Beals, editor of the *Com. Herald*, San Francisco, says:

In the history of nations the passage of a hundred years has seldom determined results which leave their impress upon mankind for all coming time. None has been so pregnant with great events, none so replete with salutary experiences and human progress as that which terminated with the Fourth of July, 1876. The mere enumeration of its wondrous achievements would require volumes of research in every department of science, art, literature, discovery, invention, political economy, emancipation from tyranny, from religious persecution and bigotry, the propagation of republican principles founded on the inalienable rights of the individual, and a host of other subjects indicating the mastery of mind over matter, the control of knowledge over ignorance. Put for the existance of this great republic, it is questionable whether the now indispensable services of steam, electricity, and their cognate elements of strength and dominion, would have been brought into requisition. This country has been, and is, the great iconoclast of the world, breaking down and destroying the idols that held nearly the whole habitable globe in the bondage of subservience to arbitrary rule, and social and political inequality before the law. Its grand declaration of principles which underlie the whole fabric of personal independence and freedom, and its steadfast adherence to the terms of that declaration, have commanded the confidence and respect of the nations, the love and admiration of the good and worthy, everywhere. The priceless boons bestowed by Providence through the agency of the United States belong equally to all the world. We have called the world to unite with us in grateful recognition of what it has received—and the world has come! It remains for us, on the western confines of this great republic, to participate fully, cheerfully, grandly, to the extent of our power, in the effort to celebrate the Centennial Anniversary of our country's birth in a manner commensurate with so august an occasion. It will infuse into the minds of those who come after us the eradicable determination to stand by principles that have blessed the whole human race.

FLOWERS AT THE CENTENNIAL.—The horticultural grounds and exposition of the Centennial comprise forty acres, covering the whole of a sugar-loaf hill, located near the center of the exposition inclosure. All the United States trees are represented, and the plants recently introduced from China, Japan and the East. The space reserved for the display of ornamental gardening contains about 70,000 flowering, and perhaps as many foliage plants, arranged in the carpet, bed, ribbon and geometric style of gardening. The building, exclusive of the main hall, and the four greenhouses, is divided into several compartments for the individual exhibits of florists and gardeners. On the north and south sides are the two greenhouses, each thirty by one hundred feet in size. These and the main building are heated by hot water, for the exhibition of choice plants of commerce, tropical and other exotic productions. The main hall, eighty by two hundred feet in size, is ornamented by a handsome marble fountain, surrounded by statuary and specimens of the ceramic art. The heating of this large building is effected as follows: Four large return flue-boilers placed in the basement of the main hall, connected by iron pipes lain underneath the floor of the passage-way, conveying water to and from the boilers, and, propelled by heat, the water moves throughout the building disseminating a genial and uniform heat everywhere.

PARIS GREEN is very widely used for destroying the Colorado potato beetle and the cotton worm. Its brilliant color is likely to prevent accidents from mistaking it for something else. Dr. Kedzie estimate that more than a hundred tons were used in one year in the State of Michigan. This extensive use brings up the questions, Will it poison the plants, and render crops unsafe as food? Will it poison the soil and injure succeeding crops? Will it become washed into drains and poison springs and wells? What becomes of it in the soil?

To answer the first question,—cabbage plants were watered with a saturated solution of arsenic, and were killed in a week, but the leaves did not contain a trace of the poison, except by a discoloration of the stem near the roots. When the solution was weaker, so as not to injure the plant, the slightest trace could not be discovered anywhere. The experiments were repeated on barley and on turnips. Again, they were tried on peas, all with the same results. Dr. Kedzie says: "Four years ago, I made a careful investigation to determine whether the potato tuber absorbed arsenic when Paris green was applied to the plants to destroy the potato beetle. I took potatoes raised in the ordinary course, and repeatedly dusted, and others to which all the Paris green had been applied that could be used without killing the plant; but in no instance could I find a trace of arsenic in the tubers. Other chemists have made similar investigations with the same results."

WITHOUT agriculture there is no wealth. Gold and silver are not wealth, they are its convenient representatives; commerce produces no wealth, it simply exchanges it; manufactures and the arts combine it. Agriculture is the prolific mother of wealth, the rest simply handle it when produced and delivered into their hands.

The earth breeds savages; agriculture breeds enlightened nations; it breeds houses and ships, temples and seminaries; it breeds the manufactory; sculpture painting and music are its offspring. The wheels of the workshops, the sails of commerce, the implements of science, the pen of genius, the pencil and chisel of the artists, the eloquent tongue of the orator, the scheming brain of the statesman, the equipages of wealth, the banquetings of pleasure—all that renders earth in its tides of life anything but a great sepulchre, move and have power of being because the fields yield their fruits to the patient toil of the husbandman.

We might manage to live without merchants, without mariners, without manufacturers, without orators, without poets, perhaps we might possibly survive the loss of demagogues, but sure I am we could not live without plowmen.

The state of husbandry in any country is the best test of its enlightenment. The thermometer of civilization rises or falls as drives the plow. You must send the plow, exclaimed a man who had traveled all over Christian missionary ground in heathen lands; a barbarian nation needs but to be plowed up, deep subsoiled, sowed, planted, and the inevitable harvest will be an enlightened nation.

AN Englishman visiting Sweden, noticing their care for neglected children, who are taken from the streets and highways and placed in special schools, inquired if it was not costly. He received the suggestive answer: "Yes, it is costly, but not dear. We Swedes are not rich enough to let a child grow up in ignorance, misery and crime, to become afterward a scourge to society, as well as a disgrace to himself."

Women.

Blanche and Nell.

O, Blanche is a city lady,
Bedecked in her silks and lace;
She walks with the mien of a stately queen,
And a queen's imperious grace.

But Nell is a country maiden,
Her dress from the farmstead loom;
Her step is free as a breeze at sea,
And her face is a rose in bloom.

The house of Blanche is a marvel
Of marble from base to dome;
It hath all things fair, and costly and rare,
But alas! it is not HOME!

Nell lives in a lonely cottage,
On the shores of a wave-washed isle;
And the life she leads, with its living deeds,
The angels behold and smile.

Blanche finds her palace a prison,
And oft, through the dreary years,
In her hardened breast there is sad unrest,
And her eyes are dimmed with tears.

But to Nell her toils are pastime,
(Though never till night they cease,)
And her soul's afloat like a buoyant boat
On the crystal tides of peace,

Ah! Blanche hath many a lover,
But she broodeth o'er old regret;
And the shy, sweet red on her cheek is dead,
For the day-star of hope has set.

Fair Nell! but a single lover
Hath she in the wide, wide world:
Yet warmly apart in his glowing heart
Love hides, with his pinions furled.

To Blanche all life seems shadowed,
And she but a ghost therein;
Thro' the misty gray of her autumn day
Steal voices of grief and sin.

To Nell all life is sunshine,
All earth like a fairy land,
Where the roses grow and the violets blow,
In the softest breath of God.

REFORMATION AND DISCRIMINATION.

BY DORATHA.

I ATTENDED a meeting for the reclaimation of fallen women. One of the speakers, in the fervor of his feelings, exclaimed, "Is there any character on the earth so degraded, so near the gaping pit, as the abandoned woman?"

The sentiment was applauded, and no one answered, "Yes, yes, the seducer!"

A thousand times lower—a thousand times more to be despised is the man whose smooth dissimulation, cunning intrigues and deceitful suavity lead innocence and virtue to prostitution.

And yet, strange as it may be, people, virtuous people, seem not to think that the depraver of woman is himself depraved. Until the seducer can bear his share of the shame—until society visits on his head an equal share of the disgrace that weighs down his partner in guilt, our cities and towns will be thronged with his degraded victims.

But how are the facts? A man, the notorious corrupter of innocence, may reform, or pretend to reform, become an influential member of a church, and be received in society as an honored guest. He may not even reform. He may notoriously continue in his wicked ways; and yet, if he has money, or position, or talent, there are not a few who welcome him into the fashionable circle; and polite and accomplished ladies who will not blush to be seen walking with him in the streets—who will even invite him into their parlors and delight to do him honor are not few.

Is this right? Is not the seducer's victim as fit for the favors of society as he? Should the one be loaded with honors—be caressed and fawned upon, while the other, even when penetent and reformed, is spurned and spit upon, denied admission into Christian churches, driven back by the force of public sentiment into the company of her former associates of the brothel,—virtually compelled to resume a life of infamy?

I ask not that the road to prostitution should be made more pleasant, or that the odium of the public condemnation should be withdrawn. But it is just that the seducer should stand on the same level with his victim and receive, at least, one half of the lashes of the public condemnation.

Household Reading.

One Touch of Nature.

My sketch was finished, and I turned to go,
Yet lingered for a minute to compare
The painted cottage in my folio
With that which stood within the landscape there.
How feeble was my picture, despite all my care.

The cotter's wife was standing at her door,
And saw her husband coming down the lane,
And, catching up her baby from the floor,
She hurried out to meet him once again,
Lavish of treasured smiles that were not spent in vain.

Their meeting all his weariness relieved;
His drudgery to merriment gave place;
Exchanging burdens, she his tools received,
And he, the baby, nestling to his face.
So went they back contented to their dwelling-place.

Weak was my sketch, and weak the matchless hue
Which nature shed around on land and sea,
Beside the beauty of affection true
That simple meeting there revealed to me.
Nothing on earth with human love compared can be!

DOTTINGS AND JOTTINGS.

BY PROF. ISAAC KINLEY.

OPEN the windows—open the doors, and let the sunshine in! See that cold-blooded man, the thermometer of whose affections never rose above zero. He loves no one, and none loves him. He enjoys no smiles nor even the sad luxury of tears. A living embodiment of baseness, his emotions are only appetite, and his aspirations only for self-gratification. He belongs to the race of reptiles, and has crawled on his belly all the days of his life. A lingering relic of the saurian period, he fairly hisses at the smiling faces as they pass.

The rose is queen of flowers not more for her beautiful colors than her sweet odors; and the human face divine is loveliest when radiant with the goodness of the heart. It is no less the affections than the intellect that raise man above the brute—that exalt him in the scale of being.

Reason, indeed, is noble. Between it and the affections there should be no invidious line. These are the heat-rays giving warmth where that does light. Love and reason are correlatives, and the two, as one, only can be beautiful or great.

Reason alone is an arctic day, bright but cold. Reason and the passions are the tropical tornado, leaving only ruin in its train. Reason and the affections are the fair summer's day, with its verdant valleys and fruitful fields.

If life is a winter, and the north wind blows, and chills, and freezes; if the flowers of love and hope wither and die before their leaflets have unfolded, it is that the blasts have not been warmed and gentled by the soft south winds of human affection.

Nature is reciprocal, giving kind for kind. Where the warm winds blow the leaves unfold and the flowers bloom. Who gives love, love receives, and is the happier and nobler for his giving.

If there were more of sunshine and less of wintry darkness in human life, how infinitely better it would be for mankind! Reader, open thou the windows and doors of thy soul and let the sunshine in.

We cannot become wise in a day, but we can resolve to do so in a single hour; and, if we heroically carry out the resolve, we shall from that time forth grow in wisdom, gradually passing from littleness into greatness.

We cannnot, in a single day, form a perfectly beautiful character; but we can resolve to do so in a single moment, and we shall instantly begin to leave off habits of evil, habits that deform, habits that degrade; and start in the growth of all that is morally good and intellectually great—we shall begin the formation of a character worthy the admiration of angels and men.

Who climbs Mt. Hamilton begins at the base; but with every step upward the horizon enlarges and beautifies. The summit attained, there lies before him, as far as the eye can see a panorama of mingled beauty and grandeur. There, too, will be placed the telescope, through whose philosophic glasses the very heavens seem nearer.

The road to knowledge leads upward. With every step the intellectual horizon expands. And as we ascend higher and higher, the enlarged prospect becomes the source of continual enjoyment.

True culture does not consist alone in extending the range of thought, or in strengthening the powers of the intellect. The educator should remember that man is a moral and social, as well as an intellectual being. The duties of life should be studied; and, even though they be disagreeable ones, the mind should be educated up to the cheerful acceptance and heroic performance of them.

What though the mind be able to grapple with the most difficult questions of philosophy—what though the imagination can soar to empyrean hights—if the moral nature be not developed, if the love of truth and justice and right be not educated into a sentiment, the man with all his learning is only a degradation.

The scion from the root of the tree that has been only cut down grows often with more vigor than the parent tree itself. The evil tree of human slavery should be taken up by the roots and burned in the fire.

The spirit of slavery is not dead. It has raised its foot indeed from the necks of the black race in order to place it the more securely on all races.

See those immense monopolies that tax the resources of the whole people in order that the few may become millionaires! See the corrupt rings that control legislatures and administrations, state and national, for the purpose of swindling the people and gathering to themselves wealth and power! See all over this land the hateful spirit of aristocracy spurning honest industry and honoring only idleness and luxury!

Think you that slavery is quite dead? Think you that this upas tree has been taken up by the roots?

We are all cowards—moral cowards. We dare not openly avow our convictions. We can face the cannon's mouth —we can stand with unquivering nerve where the death-shots are flying thick as hail about us; but in the face of the multitude shouting "Yes!" how few of us have the courage to say No! even in a whisper, though our convictions be ever so strong!

In the long struggle against slavery, it was not that the world had to be convinced that slavery is wrong. This all know by instinct. It was that the moral courage required to be educated up to the standard of accepting a title which an ignorant prejudice had rendered odious.

Man, in all his faculties and powers, is hereditary. We are the children, not of our fathers and mothers only, but of our ancestors for a thousand generations back; and the parents, not of our children only, but of their descendants for endless ages to come.

Our tendencies to virtue or vice, to strength or weakness, to health or disease, are transmitted; and it is not ourselves alone whom we elevate by our virtues or degrade by our vices. The forces go on, often to be greatly exaggerated as they descend.

The desires of the parent may ripen into action in the child. The aspirations for a better life, which, at times, even the bad man feels, may be an inspiration of positive virtue in his children, or his children's children. The parsimony of the parent which only covets the property of another, developed into a ruling passion in the child or grandchild, may take without asking consent of the law.

Thus God visits the iniquities of the parents on the children, not to the third and fourth generation only, but to the tenth or twentieth. The evil meditations of a man may send his grandson to the gallows.

It is early day, and yonder lies a fellow whose couch for the night has been the bare ground. Between comfort and appetite he chose the latter, and gave the price of a bed for last night's carousals.

Well, what else? Pity him? So I do. Give? So I would, were it wise, or just, or beneficial.

The dollar in my pocket has cost me toil, and I have a right to whatever of comfort it will buy. But, if I am not a niggard, or a villain downright, there is a real pleasure in relieving want.

The quality of mercy is twice blessed,
It blesseth him that gives and him that takes.

But if the gift is only a curse to him that takes, there is no mercy in the gift nor blessing in the giving. A dollar to him will only purchase another night's carousal. Go your way, besotted man, and hunger into soberness.

Poor fellow! He trespasses and suffers the penalties. The way of the transgressor is hard.

It is not pride of character, but the want of it, that withholds an apology for an insult given or an atonement for an injury done. He who really values his character will hasten to remove even the slightest stain. We sometimes hear of persons too proud to apologize. We should rather say, too weak, or too vain. The really noble person cannot rest quiet on his pillow with the consciousness of an unatoned wrong against another. The gifted Crittenden did many things to endear himself to the American people; but nothing which places his character in a nobler light than his rising in the Senate and, with tears in his eyes, apologizing to Mr. Seward for undeserved words spoken in debate.

All capital is the product of labor. Should not the creator of wealth have, himself, enough of it for the needs of

life? It seems just that he should. It is hard that the woman who makes your clothes should herself and her children go in rags; and not just that the proceeds of her labor should make a millionaire of one who only passes her work through his hands to the purchaser.

The remedy is in the hands of the laborer himself. Co-operation is the key to the wealth of the earth. Justly and wisely used, it will give to the laborer the profits of his own earnings and supply, in abundance, the comforts of life to every one who will give his labor to obtaiu them.

San Jose Institute, July, 1876.

EACH HAS A WORK OF HIS OWN TO DO.

ED. AGRICULTURIST: I have read considerable in your paper from the pen of "Rachel A. Ely." I have no fault to find with most of her "Up-Country Letters"—I feel rather like encouraging her in her solicitude for our health—many things she says are really good and praiseworth, but I want to criticise, good-naturedly, a few of her remarks. In the first place, I am surprised at the production of such letters by an invalid. If she is, or has been, the sick woman she claims to be, her writings seem to me to almost refute some of her arguments. The physical weakness, according to her showing, would be inconsistent with the mental strength her "Up-Country Letters" exhibit. Am I right? Or are the conclusions she draws from her premises wrong, and the result of a debilitated physical system working a corresponding feebleness of mind?

"Rachel" has a good deal to say about ministers and Christians. They will bear criticising, truly. But if she has not heard "the good pastor" urge the necessity of obeying God's physical laws, as she tells us in a late letter, she certainly cannot have listened to many pulpit discourses. I have frequently heard very able and earnest exhortations from ministers to their congregations on this subject. And it is right. It is as siuful to violate a physical law as a moral law. Nay, I am not so sure that we can break a physical law without violating a moral precept in the same act, or its consequences. But the preacher does not directly, and continually, combine the physical with the moral obedience, it should be remembered that he has enough to do, in looking after the spiritual interests of his people, to occupy all his time and ability. It does not do for one man to be everything.

Letter No. 5 wonders why they "don't take up the good tidings of obedience to God's physical laws with the moral and spiritual, combined." Why, bless you, they do; but they do not advocate obedience to the physical laws to the extent that would amount to the abandonment of their higher and more specific work. And for this we should quarrel with them. My eye does not complain of my ear because it does not do the seeing; and yet seeing is as important as hearing. Neither does my mouth find fault with my eyes because it is left to do all the eating and speaking; yet eating is more necessary than seeing. You say each organ has its own work to do, the faithful performance of which relieves it from all further obligation. True. Just so the minister has a work of his own to do. Let him attend to the duties of his spiritual calling, and some one else look after our physical welfare. Either work will be enough to engage all the time and faculties of any one individual. Divide his attention, and he will be inefficient in his performance of both duties. Let the eye see, the ear hear and the mouth eat and speak, and all work in harmony, for a common end, and perfect service will be rendered and perfect results follow.

We are social beings—all more or less dependent upon each other. We each have a work to do. The faithful performance, by each, of his particular duties constitutes our individual and common happiness and well-being. Go on with your efforts to enlighten the public mind on health topics. It's a commendable mission, and I say Amen! to it. We need it. But let others carry on their part of the work of elevating, ennobling and happifying our race with like peace. Remember the truth of my subject—"Each has a work of his own to do."

Yours, P. F. P.

REPLY TO "GIRLS' RICHTS."

In every family there is abundant scope for both masbuline and feminine supremacy without their clashing with each other. It is only with the masculine, however, I have now to do, and I call your own attention to the fact that when "masculine supremacy" is duly observed in its legitimate sphere, you have there found always the most happiness. Such is the result of my own observation, Where is the wife who does not love her husband the more for being able to confide and trust in him, to lean upon, and look up to him in all cases of emergency? If I have read nature right, this is an inherent quality of the feminine mind. Look at the effects of setting aside this supremacy in the Gewcloit case. Did it not generate contempt and finally worse, hatred, even to bringing about divorce? On the other hand, you cannot but have observed the good results of that decisive negative to the wife's request for a better house, a new buggy and improved style of living altogether. This would have brought debt, and probably mortgage. The good husband, S., took this request most kiudly, and kissing his wife relied, "No, darling, we must wait a while, and see what another crop or two will do for us." You may find other cases exactly parallel to this, all resulting from adhering to, or setting aside this criticised sentiment, "masculine supremacy."

As for the home institution, be it observed it is a farm with its appurtenances that the wife comes to, and not a millinery institution. "So far as I understand it," it is to the husband's home the wife comes—when he is so fortunate as to have one—and "he only is competent to judge" whether they shall live at the rate of five thousand a year or one thousand.

May "Girls' Rights" have opportunity of trying it, and say yes or no, as her good judgment dictates.

GRANDPA.

UP-COUNTRY LETTERS---NO. 7

BY RACHEL A. ELY.

Oh! the beauty and holiness of nature! Her laws, how divine and perfect! the obeying of which brings continual joy and blessings. It is disobedience to them which brings suffering, ruin and premature death. Surely her laws must be God's laws, and to know and follow them the divine light given us, whether moral or physical laws. Are not both equally sacred in His sight? Can the mind be as strong and active when the body is weak and sickly, I wonder? I will think it over. And another query is, why don't our clergy and teachers combine the teaching of physical laws with the moral and spiritual.

My experience goes to prove that as I gain in strength (which I am doing daily) I grow mentally, morally and spiritually stronger. My blood and brain seems tingling with the love of God's beauties, and a desire to help the poor, weak creatures who are suffering to arouse themselves and study His laws and obey them, rather than to put themselves into the hands of an M. D., and attempt to get well in spite of broken laws and wrong doing. Ah, well! the world moves slowly, and it takes years to make a perfect tree even, so I fold my hands and sit and dream of a future that I shall never see, perhaps, but a future that must surely come to this planet of ours.

When will we *do right* from the *love* of it, not through fear or because it is the best policy? When will we rightly understand the laws governing our health, so that we will not only keep well, but bear healthy children—an inheritance few give their offspring?

I have returned to my quiet, serene quarters once more—a sister of the sick woman's husband having come fifty miles or more to remain until the slowly returning strength be fully established. Like most Western women, she is ready to do anything that appeals to her common sense, even though the ideas be new and somewhat radical, so my hostess finds little difficulty in having her orders entirely carried out. And as recovery seems certain, though slow, the husband begins to think a little in his quiet moments, asking questions, and has subscribed for a health journal. The doctor who gave up the case still drops in, rubs his fat hands, and is glad to see *his patient* gaining!

My hostess is a puzzle to me continually—seemingly so quiet, and yet living her life so truly—making all circumstances conform to her ideas of right, so that one is led to think it is easy so to live. But she and her husband both say they have had their years of trials, and *now*, having determined on a certain direct course, which they know to be right and best for their children and themselves, all is plain sailing—only they must row their boat alone, single-handed, and be oftentimes misrepresented and abused by the world and neighbors even. But we all have our burdens, and theirs is small compared with many others.

I take a walk daily among the wild flowers and waving grass and forest trees, and feel refreshed by the sun, instead of weaker, as at first. We women do not get enough of the sunshine on our bodies, my good friend says, and I begin to believe its truth. At first I felt utterly *wilted* by its heat and power, but continuing daily to take my noonday nap beneath its glow, I found myself receiving renewed vigor and spirits. The hum of the insects and singing of the birds lull me to a calm repose, such as has not been enjoyed for years before. Try it, O ye invalids! and see its magic! Make two calico wraps and go to the mountains; leave finery and society and civilization behind you. Return to simple habits, plenty of coarse bread, fruit, vegetables, eggs, butter, milk and spring water to drink and to bathe in, sunlight to walk and to sleep in, and mountain air to breath. With no worry of mind, return to childhood again and see if you do not begin to feel *red* blood throbbing through your veins and filling your heart with future resolves of right doing, and withall a deep pity for all the sick and weary ones who daily drag life's burden, with no hope but the grave as a release.

Acts are only thoughts matured.

Boys and Girls.

The Child's Centennial.

BY MARIAN DOUGLAS.

Around the purple clover-flowers
The butterflies were flitting;
And on a stone beside the road
A little boy was sitting.
The fragrant air his yellow hair
Around his face was blowing,
And, down his pretty rosy cheeks,
The great round tears were flowing.
His trowsers were of coarse brown cloth;
His frock was made of tow;
For little Ebenezer lived
A hundred years ago.

Along the road, upon a horse,
Two men came, riding double;
And one spoke out, "My pretty lad,
Pray tell me what's the trouble."
But, at his friendly words, the boy
Began to sob the louder;
"O, sir," he said, "my father took
His gun, and horn of powder,
And rode away this very morn
To help to fight the foe;"
For there was war within the land
A hundred years ago.

The foremost man drew in his rein
(His horse was somewhat skittish),
And said, "My dear, I would not fear;
We hope to best the British.
And when the Yankees win the day,
And send the Red-coats flying,
And home again your father comes,
You will not find him crying;
You'll be a happy fellow then."
"Oh, that I shall, I know!"
Poor little Ebenezer said
A hundred years ago.

"But if he should not come at all,
And we should find, instead, sir,
A sword cut off his head, sir?"
"Oh, even then," the man replied,
"We'd proudly tell his story,
And say, 'He died for freedom's sake,
And for his country's glory.'
And here must be the little son
Who see father fights the foe;
We need stout hearts." And so they did,
A hundred years ago.

The man rode on, and home again
Ran little Ebenezer;
"Now I must share my mother's care,"
He said, "and try to please her;
And I must work in every way—
Rake hay, and feed the cattle,
And hoe the corn, since father's gone
To give the British battle."
Oh, looking backward, let us not
Forget the thanks we owe
To those quaint little boys who lived
A hundred years ago!

"OUR CORNER."

THE LETTER BAG.

WHY is it that there are no more letters this month? Aunt Polly hopes that her nephews and nieces are not going to "throw off" and try to forget her. Cannot you make out the answers to the puzzles, etc.? How can Aunt Polly know who has sent the best puzzle unless some are not guessed? If you don't send me the answer to such as you can find out how can I know which you cannot find out? Now, try again, and see if you cannot make out the puzzles given in June and July, and send me the answers, or else say which are the hardest. Now, write us something good and funny, for "Our Corner" must be jolly, you know.

Daisy writes a nice letter. Here it is:

Dear Aunt Polly: I thought I would tell you how I spent my Centennial Fourth of July. Papa decorated his carriage so that it looked very pretty. He covered the top of it with a large American flag, festooned it, and then trimmed it with evergreens. I invited three little girls near my age whose papas do not keep horses. We took a nice lunch, and went up in the woods. My papa put up a swing, and then mamma spread the cloth in the shade of a beautiful live oak, and we gathered aronnd it a merry little party. We had some fire-

crackers, and had a nice time making all the noise we wanted to. We were near a brook where we gathered some beautiful ferns. We saw one snake, but did not kill it. I hope all your little friends had as nice a time on the Fourth as I did. Here is a short puzzle:

My first is in lend, but not in borrow;
My second is in to-day, but not in to-morrow:
My third is in Zillie, but not in Mollie;
My fourth is in baby, but not in dollie:
My whole is what little boys and girls never should be.

DAISY G.

Tommy Clark, of Livermore, has not forgotten us. Here is a letter and puzzle he has written:

Dear Aunt Polly: The answer to Jennie's puzzle is "Aunt Polly offers premiums for the best puzzles; let us all try." I noticed that she did not use any figure two at all. I send an enigma:

My 18, 23, 33 is light.
My 31, 7, 24, 13 is to venture.
My 23, 16, 9, 8, 7, 27 is a beast.
My 3, 32, 29 is an animal.
My 4, 19, 29 is to permit.
My 32, 18, 11, 15, 14, 31 is a preposition.
My 12, 1, 29 is good to eat.
My 11, 15, 18, 24, 21 is to hasten.
My 2, 30, 29 is an adverb.
My 14, 9, 6, 25 is to whistle.
My 5, 17, 20, 33 is a whirling pool.
My 10, 26, 28 is turf.
My 24, 22, 20 is a color.
My whole is represented by one of the letters of the alphabet.

TOMMY C.

Here is another letter from Livermore:

Dear Aunt Polly: I received my chromos. I thank you for them. I love the darling little birds and chickens; nothing could have pleased me better. I was very glad to see my rebus in "Our Corner." Your niece, MARY C.

Mary sends another rebus, which I cannot give because the printer has no way of illustrating it. Such things need to be engraved on wood, and Aunt Polly is not an engraver.

Here is a whole string of puzzles sent us by "Two Californians." How many of them can you make out? First let us try the word rebus. Here it is:

Love me Love

DOUBLE ACROSTIC.

Read downwards the initials form a city in Georgia; the finals a city in Wisconsin: 1, a city in New Jersey; 2, a city in Florida; 3, an island belonging to New York; 4, a range of mountains in Asia; 5, a city in Italy; 6, a city in Canada; 7, a city in Illinois.

SQUARE WORDS.

1, a celestial body; 2, domestic; 3, an ejaculation; 1, a girl's name.

1, to peruse; 2, a girl's name; 3, a minute particle; 1, is not perfectly dry.

CONCEALED TREES AND FLOWERS.

1—Tell Ethel May wants to see her.
2—Hang up the dish-pan, Silvia.
3—I never saw such force, daring and valor displayed before.
4—Did you see that sweet peasant girl?
5—Yes. Have you copied that map, Leander?
6—No; but I will. I say, pick up that pin, Karl.
7—What! Are you sick? A more sad event could not have happened.
8—I rise early every morning and take a walk.

WORD PUZZLE.

My first is in chocolate, but not in tea;
My second is in you, but not in me;
My third is in archer, but not in frog;
My fourth is in cat, but not in dog;
My fifth is in ride, but not in walk;
My sixth is in stand, but not in talk;
My seventh is in thumb, but not in hand;
My eighth is in hat, but not in band;
My whole is a flowering bulb.

GEOGRAPHICAL ENIGMA.

I am composed of twenty-five letters.
My 5, 10, 9, 22, 23, 2, 4, 10 is a river in river in the United States.
My 4, 22, 3, 8, 10 is a river in Spain.
My 11, 20, 6, 15, 4 is a lake in Africa.
My 20, 10, 16, 35, 9 is a sea in Australasia.
My 23, 24, 7, 4 is a city in Arabia.
My 9, 19, 1, 25 is a city in South America.
My 9, 15, 20, 5, 7, 4, 19, 18, 13 are islands in the Indian Ocean
My 14, 2, 17 is a cape on the east coast of the United States.
My 3, 12, 21, 5, 15 is a city in New York.
My 3, 21, 25, 6 is one of the United States.
My whole are the given names, without the surname, of one of the Princess of Wales' children.

MISS OTTERSON'S SCHOOL.

Dear Children: I promised Aunt Polly last month to write you something about Miss Otterson and her little school and family—for she is a woman of family although a delicate invalid. Though never married, yet she has adopted ten little children, eight of whom are living to bless and repay her, I trust, for her tender care and love of them all these years. Her eldest boy is now attending the Normal School. Her eldest girl is her thrifty housekeeper, and drives the splendid team daily after the children, taking them home also. Think of that, little folks! Mustn't it be nice fun to have a ride to and from school? No tardy marks; no dusty, tiresome walk; but a brisk ride. And, ye mothers! what a relief to feel sure that the little ones have got to school safely, and will come home all right, too!

There is a new school-house being built for Miss Otterson adjoining her present house, and when that is finished I will tell you all about her school.

Her twin daughters (charming girls, about 15) entertained us with music, showing much natural talent and great perseverance. She has five girls, the youngest nearly nine years old.

Do you know, children, when I look at Miss Otterson, that I felt a reverence for that small-bodied, but large-souled woman, whose life has been a struggle, but who has filled a mother's place to so many motherless hearts? Yet this frail woman has willingly and gladly taken upon herself duties that few mothers have performed, though the joy of motherhood has paid them for all. Her example should inspire us all to do what we can to help this big human family along, making it better for the little we we can do. JEWELL.

GRANDMA'S TALKS.

Easy Lessons from Nature—No. 6.

Good morning, Johnny and little Lucy. I am glad to have a talk with you once more. What news have you to tell me this morning? That Johnny has just broken a window with his new ball. What a pity! I hope, Johnny, that you have pocket money enough left from the Fourth of July to pay for it. If children pay promptly for the mischief they do, it makes them more careful in future.

See, I have a ball in my desk here which would be far safer for you to play with, Johnny. It has a rubber string attached, which you can keep firm hold of; then see, when I throw it how nicely it springs back into my hand.

Oh! this is a girl's ball, is it, and you don't want it? Well, I will give it to Lucy when our talk is over.

Now, as I lay it on the desk, why does it roll immediately to the floor, as if pulled off by an invisible string, then after rolling a little it stops still? What starts that ball, and what stops it? Johnny says the desk is slanting and the floor is flat, and balls roll so nicely, they never stop the minute they touch the floor. But this does not answer my question. What pulls it down like an invisible string the instant it is laid on a surface not exactly level? Did either of you ever think of that before when you have had so many bumped heads and tumbles? You see, the earth is always pulling down everything smaller than itself. This force is called

ATTRACTION OF GRAVITATION,

the force that pulls everything towards the earth.

Lucy, can you lift this table? What makes it too heavy for you? Yes, the earth can pull harder than you can. So you see that attraction gives *weight*; anything is heavy or light according to the force required to overcome the attraction of gravitation.

What is the shape of the earth, Johnny? Round, like an orange; and attraction makes it this shape also. When you are older you will be better able to understand the reason.

What do you mean, then when you say the floor is flat? This is a difficult question to answer, so I will help you. Now, suppose the very moment you drop your ball to the ground here in California, some boy on the opposite side of the earth (in Africa, near the Cape of Good Hope, perhaps) drops a stone. The ball and stone would fall directly towards each other, attracted towards the center of the earth. Now suppose another boy in New York drops a stone at the same moment, it will also fall towards the center of the earth, and you three boys are standing with your feet pointing towards each other. Now each of you would call the floor *flat*, or *level*, under your feet—and why? Because, if really level, every part of the floor or ground upon which you stand is equally distant from the center of the earth. In building houses carpenters use what is called a "spirit level" to get their floor exact, so that the house will stand perfectly straight. The first time you see a carpenter building a house, I wish you would ask to see the instrument he uses to get the exact level with.

Now, you notice that my desk is made so that one edge is nearer the floor than the opposite edge. Johnny calls that a "slanting" surface, which is quite correct. If I place the ball on this slant, the earth pulls as an invisible string attached to the center of the ball, and as such a string would fall outside the little spot where the ball touches the desk, it would be pulled over and continue to roll until the line pulls straight through the point of contact, when it will stop.

Now, Johnny, can you answer my question, what starts and what stops the ball? Attraction to the earth. You are right.

This attraction extends to the moon, and causes it to revolve around the earth. Lucy wants to know why the moon does not smash down upon us then.

Watch this ball, Lucy, as I whirl it around my hand by the string—the string will represent the attraction pulling the ball (the moon) to my hand (which we will call the earth). Notice how the string stretches as if trying to break! I will dip the ball in water, then whirl it, and see how the water flies off in all directions! If I should let go of the string, the ball would fly off with great force. This force is called

THE CENTRIFUGAL FORCE,

and when bodies are moving around a center its tendency is to make them fly off from the center. Attraction, you will remember, draws them towards the central body. If these *opposing forces* are of equal strength the revolving body is kept moving in a circle, as the moon revolves around the earth, and the earth around the sun. I have seen a boy whirl a pail half full of water round and round, as I am whirling this ball, safe not to spill one drop as long as rapid motion was kept up. Why? Because the water was forced back in the pail, away from the center of motion, by the centrifugal force. One unfortunate boy tried the same trick very successfully with a pail of eggs, until his companion slyly poked out a stick, stopping them suddenly when directly over his head. Lo! in an instant, he was covered from head to foot with broken eggs. Stopping the rapid motion put an end to the opposing force, and the earth pulled the eggs straight down without any reference to the naughty boy who was under them.

LIGHT BODIES.

Do you ever see anything rising from the earth instead of falling to it? Johnny says balloons rise up, and Lucy says smoke. I will explain the reason of that. Here is a cork which, if I let go, will fall to the table. I will drop it into the glass full of water. It immediately rises to the top and there remains. Why? Because the earth pulls stronger at the water than at the cork, or, in other words, the cork is the lighter, and is pushed up by the water. So it is with the balloon, which is filled with a gas much lighter than air; the same with smoke and steam, they are lighter than air.

Here I have a curious little plaything—a little wooden doll, an inch long, which stands alone, but always on its head. Set it on its feet. Pop! over it jumps upon its head. The doll is made of the pith of some kind of wood which is very light, and in the very top of its head a piece of lead is hammered. The head is so heavy that it is attracted to the earth the moment the doll is free. We call these "pith-witches."

Organization and Duties of the Judges on Live Stock at the Centennial Exhibition.

In our June number, page 86, will be seen a list of stated displays at the International Exhibition. We now give the rules governing the judges for awards of premiums on live stock.

1. Awards shall be based on written reports, attested by the signatures of their authors.

2. Reports will be based upon inherent and comparative merit, the elements of merit being specifically mentioned.

3. The judges assigned to each group will choose from among themselves a chairman and secretary. They must keep regular minutes of their proceedings. Reports recommending awards shall be made and signed by a judge in each group, stating the grounds of the

proposed award, and such reports shall be accepted, and the acceptance signed by a majority of the judges in such group.

4. The reports of the judges recommending awards, must be returned to the Chief of the Bureau of Awards not later than ten days after the close of the exhibition, in each group.

5. Awards will be finally decreed by the United States Centennial Commission, in accordance with the Act of Congress of June 1, 1872, and will consist of a special report of the judges on the subject of the award, together with a diploma and a uniform bronze medal.

6. In addition to reports on the merits of individual exhibits, the judges of each group will be expected to render a report general in its nature, summarizing the exhibition in their group, and indicating the recent progress noted in breeding, rearing or training.

7. Vacancies in the corps of judges will be filled by the authority which made the original appointment. No exhibitor can be a judge in the group in which he is a competitor.

8. The Chief of the Bureau of Awards will be the representative of the United States Centennial Commission in its relations to the judges; upon request, he will decide all questions which may arise during their proceedings in regard to the interpretation and application of the rules adopted by the Commission relating awards, subject to an appeal to the Commission.

The above rules bear the signatures of A. T. Goshorn, Director-general, and Francis A. Walker, Chief Bureau of Awards.

THE CAUSE OF THE HARD TIMES.

Ed. Agriculturist: Hard times. You can hear people of all trades and professions complaining of the very hard times notwithstanding our bountiful harvest of all kinds of vegetables, fruits and grains. Now, why is this? and what is the cause? The problem, to some, may seem difficult of solution. We think to any candid mind, after one moment's reflection, the answer must be, that it is the present uncertain condition of our depreciated circulating medium. This depreciation is caused and upheld by a class of Shylocks in the shape of brokers, money changers and usurers, who are grinding the very life's blood, as it were, out of the honest, industrious laboring class of every needful vocation in life for the purpose of filling their coffers with gold that they take from the unsuspecting, honest poor, in the form of large discounts and usurious interests, by every possible means of chicanery that it is in their power to devise.

That this is the case, the majority of thinking people are ready to admit, but how can it be remedied? I will tell you. There never was a better time to get rid of this horde of Shylocks than the present propitious hour—just in the commencement of a new century of our national existence, and on the eve of a Presidential election. Why should we hesitate to declare ourselves free from the tyranny of such public leeches, by disarming them in the very commencement? We have the means and power within our grasp if we have the manhood and patriotism to use them, which we can do by the following resolution, viz.: that we, the imposed-upon small dealers, merchants, tradesmen, farmers, laborers, and citizens of every class of the State of California, will now and henceforth use United States greenbacks at their par value for our circulating medium or money of account, the same as is done in the other States, with silver enough for exchange. Such a resolution would place every one upon an equal financial basis, and enable the honest, industrious Caucasian race, the citizens of the United States, to come from the other States and displace this horde of coolie foreigners; because, if they were compelled to take the United States greenbacks they would not be so anxious to come to this Coast. We would do away with so many middle men and extortioners as money changers, and strike a death-blow in favor of anti-coolieism, and at the same time bring into general use and circulation in this State the most convenient form of money that can be made, besides the safest and best-secured of any circulating medium ever known to the civilized world, every dollar of which is secured by the entire property of the United States, and will be good as long as this Government shall last, and when it is destroyed gold and silver coined by this Government will not be money any longer with us.

By a laboring man of San Jose, California. S. S. R. Equity.

BEE-KEEPING IN SAN DIEGO.

Ed. Agriculturist: Since I last wrote you, I have met many of the bee-keepers of the county and compared notes. Though there is a slight improvement in the situation, the outlook, on the whole, is gloomy indeed, both as regards production and prices. Many apiaries are for sale at almost any price. Still, I think those who have grip enough to hold on will come out right at last. In some favored localities there has been a large yield of honey. I have met but now one man on the St. Marcus who commenced the season with 108 colonies. He has shipped 80 cases of comb, and 5,000 pounds of extracted honey, and estimates the balance of his crop at 60 cases. And he has increased his apiary to 290 colonies. In my own immediate neighborhood none have done well, and you will understand why when I tell you there are 1,600 colonies on five miles square! Our bees have nearly quit storing—leaving off a month earlier than last year.

A season like this makes one cast about for some means to increase our bee forage. Anyone who will introduce a plant that secretes honey well, and will grow on our mountain sides, will be hailed as a public benefactor. I have experimented some with hoar-hound, and though it grows anywhere, and the bees work it constantly for at least three months, I have doubts as to the quality of honey it produces. If any of your readers can enlighten me on that subject they will confer a favor on me and many others.

Jas. —.

PRACTICAL DIRECTIONS FOR GRAFTING GRAPE VINES.

BY G. N. WHITAKER.

Ed. California Agriculturist: The article in your July number on grafting vines calls out this jotting of practical experience, and if it should be of any benefit to others they will be welcome. I have tried all modes of grafting with but little success except the one I herewith submit, and I have had good success with this form, not losing more than one out of fifty.

I cut my scions in February, from last year's growth, long enough to include three or four buds, and keep them in a dormant state until the vines I graft in are well started to grow—say one or two inches long. I then remove the earth from the vines down to, or near, the first roots; then rub off all the old loose bark, and saw off from one to three inches above the first roots. With a saw, make one, two or three straight cuts down into the stump. If the stump is small I only make one cut in it, but if the vines are large they will admit of two or more cuts. Each saw cut will admit of two scions, one each side of the stump. With a sharp knife, trim the saw cuts out the proper shape for a wedge graft. Trim the scion to fit accurately, leaving a small shoulder on each side of the scion; then insert in the stump, being sure to push it down to the shoulder, and also make a connection with the bark of the scion and the bark of the old stock. Cut the scion down to two buds. When finished, fill up with fine dirt level with the top of the ground, leaving one bud of each scion uncovered. Drive a stake as near as I can without disturbing the grafts. The stake should be as high as it is desirable to grow the vine, and before the grafts have grown large enough to bend over on the ground, I tie them to the stake, keeping the sprouts pulled off during the first and second years, when the grafts are one year old, in the pruning season, say in January or February, prune out to one and two grafts. This process, with such other necessary treatment as any fruit grower will observe from time to time, will insure a crop of fruit the second season after grafting. I dig up all the stumps that fail to grow grafts, as it is useless to try to graft them over.

Santa Rosa, July, 1876.

EASTERN CORRESPONDENCE.

New York, July 8, 1876.

S. H. Herring: *Dear Friend:* I thought a few words from an old friend might not be amiss. Having crossed the plains in '49, and lived in the Willows near San Jose since '52, myself and wife concluded to improve the Centennial year by visiting friends in the East. I noticed at different points near the overland railroad the old immigrant road over which I traveled long ago. Of course, we went to Philadelphia to see

THE WONDERS OF THE WORLD.

For me to give a description of what I saw would be useless, as doubtless you have read in the newspapers of the miles of machinery of all kinds, the statuary, the paintings, and all kinds of goods, from diamonds worth thousand down to a machine for making brick. The stock of all kinds on exhibition is splendid, and so is everything you can mention.

I am at present visiting near the Catskill mountains, New York. They look very much like the mountain range near Los Gatos, California, with perhaps more timber. Everywhere I have been I hear the same complaint,

"HARD TIMES,"

Farmers say they cannot raise enough to "bring the year about and pay taxes," and I don't wonder at it. They sell their hay for $12 per ton, and rye straw for $18 to $20 per ton to make paper (an item our straw burners should make a note of). The consequence is, there is no manure to go back on the farm, and of course the land is lean and there is no sale for real estate. Farms that could be sold for ten thousand dollars eight years ago, could not bring five now. Nobody wants to buy. While Duchess county raises stock, sells little hay, and manures the land, the farmers are fat, their land rich, and no mortgages. It is no use to theorize about "hard times." No one is wholly to blame for the hard times. Some blame the President, some Congress. The Democrats blame the Republicans; the Republicans, the Democrats, and I have no doubt they are both right. The truth is, we are all to blame. Everybody has been extravagant, and almost everybody has tried to get rich—some honestly, others dishonestly. Some have gone out of business. Men who were doing business on borrowed capital have failed. We are getting down to "hard pan." The consequence is everyone gets hurt some, and some a great deal. The price of provisions keeps up. The poor suffer. Just think of it. Flour sells here from $8 50 to $12 50 per barrel. Wages in the harvest field, to men working fourteen hours a day, is $1 50, and the farmers think that is too much! Articles of clothing were never cheaper. Suits of clothes you ask $2 2 to $25 for in San Jose, can be bought here at $14 to $15. Teams of every description are in good demand—$7 a day for a second-rate "turn-out." The people are rushing headlong after pleasure, but keep up the cry "hard times." Rum shops dot the continent, and are filled with bloated customers who cry "hard times." Politicians are noisy, and aspirants to office are hopeful, and still the same cry.

Now, Mr. Editor, it is not the scarcity of money that causes the "hard times." There is probably more money in the country to-day than ever before; but money don't circulate, and the poor are made to suffer.

NOW WHAT ARE WE GOING TO DO ABOUT IT?

We can help the case some by wearing our old clothes a little longer. We can turn them inside out, and upside down, and make them last at least until fall. Don't break that $20 for boots, but wear the old ones. Be sure and keep the mortgage off, whatever you do. Keep away from town except when it is necessary to go. There is always something to do on the farm. Be sure to educate the children. And here let me say, in all of my travels here so far, I have seen no place to come up with our San Jose schools. We must live on wholesome food, as our fathers and mothers did, and dispense with luxuries that will do us no good. Ride less; walk more. Keep out of debt. Have but few wants, and supply them. Trust more in God, and less in politicians. We don't need as much of this world's goods as we think we do. There are some that have more than enough of the necessaries of life, but there will be equality some day.

Now, Mr. Editor, though I am a tiller of the soil, and may not be qualified to theorize on this subject, yet I will give you my opinion.

WE ARE, AS A NATION, TOO EXTRAVAGANT.

Look at the millions that are squandered by our Government, and so on down to the lowest constable. We are sending millions out of the country for delicacies that could be dispensed with. Millions more for silks, satins and flumadiddels. Of course our national debt is being reduced some. While Congress is appointing committees to investigate our affairs it would pay to send over to France and find out how they pay the indemnity to Germany, and where all of the gold came from that is in the banks of France, and how the people economized to get all of that coin. Bring such methods into practice, and it need be but a few years before our national debt is paid off and our banks full of coin. Let us export more, and import—I was going to say nothing, as we can raise everything that is required at home. But I must stop for the present. We are enjoying ourselves very much with old friends, but how many the changes since we left here! J. M. Patterson.

A Bit of Common Sense.

"The busy days are fast crowding upon us," says Ella, with a little sigh.

"Yes," answered practical Etta, "and now I am about to deliver a short lecture;" sitting down and folding her brown hands over her smooth white apron. "Never do your work, but once, Ella, and then do it well. A great many do their work over six, eight, or ten times by so much thinking and talking about it. Now, to-day is Monday, and you and I have done a heavy day's washing—"

"Yes, I am perfectly conscious of it," interruped Ella.

"The clothes are out in the sunshine drying," continued Etta; "do not give them another thought until it is time to bring them in. If you are very tired lie down and go to sleep; if not, occupy yourself with an interesting book. We have done enough hard work today. You well know mother does not expect us to do anything more until supper time. To be sure we must go to house-cleaning to-morrow, but do not let the fact enter your mind until after breakfast to-morrow morning; then it will not require ten minutes to plan our work, and one can see so clearly after a good night's sleep. Now, work in this way, Ella, and you will soon find yourself singing all day long, instead of wearing that ugly frown upon your brow."

"Yes, that's just it!" said their father, who had been an amused listener to Etta's lecture, opening the kitchen door; "there's a bit of common sense in that small head of yours, my daughter."

1776 AND 1876.—Here is a centennial contrast—first as copied from Poor Richard's Almanack—1776:

> Farmer at the plow,
> Wife milking at the cow,
> Daughter spinning yarn,
> Son threshing in the barn,
> All happy to a charm.

And this is the modern improvement—1876:

> Farmer gone to see a show,
> Daughter at the piano,
> Madam gayly dressed in satin,
> All the boys learning Latin,
> With a mortgage on the farm.

Sheep and Goats.

Angora Goats and Mohair---Criticisms Answered.

HARRISON G. OTIS, of the Santa Barbara *Press*, thus answers an editorial article on the mohair interest which appeared in the *Alta California* some time since, in which occur statements and hostile criticisms not justified by the facts, in his opinion:

The article makes the loose assertion "that there has been no mention in the commercial statistics of any shipment of goats' wool [from California], though seventeen years have elapsed since the importation of Angora goats was commenced, and though, according to the assessors' statistics, the State had 24,000 of them 1871." The impression here conveyed is that breeding for fleece has been prosecuted in this State for seventeen years. On the contrary, nearly all the work in that direction has been done within ten years. There were but few importations and but little breeding in California prior to 1867. The writer's incorrect statement as to shipments of fleece is immediately followed by an admission which takes away half its force, even if it were true. The admission is in these words: "It is true that most of these were grades crossed with the common stock, no Angora she-goats having been brought with the first bucks."

It is just this fact, and her very small and recent beginning in this necessarily slow work, that has kept California back in the prosecution of this splendid industry. To breed from common, non-fleece-bearing ewes large flocks of good grade mohair-producing goats is not the work of a day; it is a work of years. But there was no other course for California breeders to pursue. The State could not be stocked with pure mohair goats in a century, if importations alone were to be depended upon, unless they be more frequent and extensive than they have been; for the Angora comes from a distant, hostile, and almost inaccessible region of Turkey in Asia, ten thousand miles away.

The fact that a very large proportion of all the fleece-bearing goats now in California are only grade Angoras would of itself be a sufficient answer to the charge that no considerable shipments of mohair appear in the official statistics, under our economical system of breeding by crosses of pure Angora bucks on the native short-haired ewes, low grades must of course come before high grades—first light fleeces of short mohair intermingled more or less with kemp, according to grade, followed in the end by the longer, finer, heavier and more lustrous fleeces of the thoroughbreds. In other words, each generation, under scientific breeding, becomes purer and its fleece finer than its predecessor.

But it is a great mistake to suppose that there have not been any shipments of mohair from California, and it is not creditable to the *Alta* to make such an assertion. Many such shipments are on record, and we are satisfied that there are many more which have not been reported, because mohair is frequently shipped as wool to avoid the higher freight charges imposed by the railroads. These charges are generally double those on wool; and we have the record of an instance where one lot of mohair was charged 6¼ cents per pound for freight eastward, while wool was being carried for 2¾ cents per pound. The consequence was that the next lot sent by these eye-opened shippers was marked *wool*, and was of course quoted in the commercial reports as wool. We may reasonably conclude that there have been many similar cases, thus materiall reducing the statistics of mohair exportations. Small as these shipments confessedly are when compared with the shipments of our great staple, wool, they have already been sufficient to prove that the culture of the Angora in California is an assured success. The results achieved are really adequate to the means employed.

It is a great mistake, too, if not a misrepresentation, to assert, as our cotemporary does, that "the wool sheared from Angora goats in California is so small in quantity that it is not considered worthy of notice in commercial or official statistics." There is abundant evidence to be had that many very fair clips of Angora fleece have been made yearly in California, and the mohair shipped for manufacture to Philadelphia, New York, Boston, Jamestown, and Liverpool, England, during the last five years. And we may add that facts in our possession show the demand in those markets to be beyond the supply.

The *Alta's* information on the goat subject is by no means confined to California; such as it is, it extends all over the world, as this extract indicates:

(Continued in next issue.)

Gloves Gloves.

CHEAP, COMFORTABLE, SERVICEABLE

THE ANGORA

ROBE AND GLOVE CO.,

OF SAN JOSE, CAL.,

Are making a Specialty of Manufacturing all styles of Gloves from the Angora Goat Skin, and claim for them:

1st.—They are cheaper than buckskin gloves.

2d.—The skins are tanned with the grain on, and are very nearly water-proof, and when, by long exposure, they are wet, they dry out perfectly soft—as good as new.

3d.—They will out-wear the best buckskin gloves.

4th.—For a HARVEST GLOVE, they have no equal.

These articles are manufactured in all styles, from the cheapest Laboring Glove to the Finest Fur Gauntlet. Also, all descriptions of

FURS, ROBES, MATS, RUGS, Etc

Which, for Beauty, Durability, and Cheapness, are inferior to none.

Buckskin Gloves, Mittens, Etc.,

In all verieties, and as good as the best.

FOR CONSUMPTIVES!

And others suffering from

CHRONIC DISEASES

AT

LAKE TAHOE.

SUFFERERS FROM ASTHMA, BRONCHITIS, Consumption, all Lung Diseases and all Chronic Diseases, are informed that DR. BOURNE has devoted more than Two Years to a careful study of the meteorological phenomena of Lake Tahoe, with special reference to its climatic value for sufferers from lung diseases. His experience satisfies him that it probably is, from its altitude and peculiar surroundings, UNEQUALLED by any other known region on earth for its climatic aid in such diseases.

Without Medicines, Dr. Bourne effects cures in cases considered hopeless under other modes of treatment; his method being peculiar to himself, and the result of an experience as a Water-Cure Physician during more than a third of a century.

It is Dr. Bourne's effort to make quick cures in all cases, and he always designs to be, and is, eminently successful; but upon no condition will he accept a patient who entertains the absurd opinion that "sick people must not eat."

☞ Cures in Dyspepsia Guaranteed.

The best of food, and plenty of it, will be provided.

A limited number of patients will be received who may be willing to pass a few weeks in retirement and primitive simplicity.

Address,

DR. GEO. M. BOURNE.

Tahoe, Placer Co., Cal.

JOSEPH WOOLF,

Manufacturer of Trusses, Suspenders, Artificial Limbs, etc.,

No. 360 FIRST STREET, SAN JOSE.

Are you Ruptured? Come to me and get a Truss that will fit you. Radical Cures are effected with my Trusses.

Save $50! Why Pay $85?

Sewing Machines

REDUCED PRICE, $35.

Home & Home Shuttle Sewing Machines

Reduced to Live and Let Live Prices.

THESE MACHINES ARE ALL SUPERIOR to any and all; nice sewers, straight needle, two threads, shuttle, lock-stitch, the simplest and cheapest, and the lightest-running first-class machines in the market. To see is to convince yourselves. ☞ Remember, all Home and Home Shuttle Sewing Machines have the Hall Treadle attached without extra charge.

THE HALL TREADLE

For Sewing Machines,

THE MOST IMPORTANT IMPROVEMENT EVER MADE.

It saves labor and preserved health. No more diseases and deaths, side or back aches from using sewing machines. No teaching required. A child can run it. Always starts the right way. Never goes backwards and breaks things. Can be stopped instantly. With it on your machine, you can do double the work you can do without it. Fifty stitches can be made with one pressure of one foot. Approved by the Massachusetts State Board of Health (see official report, 1872), Massachusetts Medical Society, and Massachusetts Charitable Mechanics' Association. The HALL TREADLE is a part of all HOME MACHINES sold by me.

☞ The Hall Treadle can be attached to any other sewing machine. Remember this. We will attach it onto any machine. It will cost you only $12, and will save you a deal of hard work and trouble.

THE HALL TREADLE GRINDING MACHINE

Must be seen to be appreciated. For a Farmer or Mechanic to see it, is to buy one. It is an indispensable article in every house, shop or hotel.

THE HALL TREADLE JIG SAW AND BORING MACHINE

Is an accomplishment in every workshop. The Hall Treadle is applicable to all machinery requiring a foot power—Sewing Machines, Grindstones, Jig Saws, Turning Lathes, Jewelers' and Dentists' Lathes, etc. Send for circulars.

OUR MACHINIST.

In connection with my regular business, I have a fine MACHINE SHOP, for repairing all kinds of machines and like work, and have employed MR. CHARLES C. REDMOND, a Skillful Machanic, as manager, and am now prepared to repair machines and machinery, make models, etc., on the most reasonable terms, and ALL WORK GUARANTEED.

B. J. SALISBURY.

PROCLAMATION.

Chicago & Northwestern Railway.

Is the popular route overland to the East. Passengers for Chicago, Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their trans-continental tickets via the pioneer route,

THE CHICAGO & NORTHWESTERN R.R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fortwayne and Chicago and Pennsylvania Railways.

- Through trains daily, with Pullman Palace Cars through to Philadelphia and New York on each train.

THROUGH TRAIN, WITH PULLMAN PALace Cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (New York Central and Erie Railways):

- THROUGH TRAINS DAILY, WITH PALACE
- Drawing Room and Silver Palace Sleeping Cars through to New York.

By the Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways:

- Through trains, with Pullman Palace Drawing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

By the Baltimore and Ohio Railroad:

- Through trains daily, with Pullman Palace Cars for Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace sleeping cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through trains to Chicago from all points West, secure to passengers all the comforts in modern Railroad Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento, and in all the Ticket Offices of the Central Pacific Railroad.

MARVIN HUGHITT, Gen. Supt., Chicago.
W. H. STENNETT, Gen. Pass. Agent.

Splendid Premium

To the Boy who will get us

40 New Subscriptions

TO THE

CALIFORNIA AGRICULTURIST

AT $1.50 EACH.

For only 40 New Subscribers, which you can get in your district in a short time, we will give the Hall Treadle

JIG SAW AND BORING MACHINE,

PRICE, $45.

The Hall Treadle Jig Saw, for bracket and pattern work, and all light scroll sawing, has no equal in the market. As the lower and upper arm are alike, and the saw fastened in a spring head, and with a roller in the table back of the saw, we are able to get a steady upright, motion that leaves the work smooth, so that it requires no further finish. The saw head is so arranged that any fine saw is easily adjusted, and requires no particular make of saws. The Boring attachment has all the adjustments usual in a boring machine. This saw works with ease; a lady can run it with a little practice, in the same manner that she can run a sewing machine. An investment in the Saw and Boring Machine will pay any family in making ornaments to decorate their home, and, as well, will occupy the mind and body in an interesting and healthy mechanical study.

SPECIAL PREMIUMS.

SEASONABLE HINTS.

SEPTEMBER is an important month to the gardener in this climate.

There is a good deal to look out for, which, if done in season, will not be regretted.

The seeds of annuals and perennials, as they ripen, should be carefully selected and saved. Save only the best seeds from healthy plants. When thoroughly dry put into glass vials so that no insects or mice can get at them; or they may be done up in papers, the name written on, and be kept safely in a covered glass or earthen jar.

If the seeds of perennials are planted this month in rich moist earth, in beds or boxes, and are carefully tended, they will grow sufficiently this season to come into early bloom next season, whereas, if the planting is deferred until next spring, you will have to wait a whole year for blossoms. This is a matter of some moment to every lover of flowers. Hollyhocks, Perennial Peas, Sweet Williams, Pinks, Carnations, Evening-Primroses, Rockets, Foxgloves, Poppies, Stocks, Wall flowers, Pentstemons, Primroses, etc., will make a good growth during the next two months.

Cuttings of various kinds will grow enough to make fair roots, and be fine plants another season if put out at once in suitable soil and kept well watered. Pure sand is as good as anything to start cuttings in. They may be planted in boxes or in beds, and need considerable light and sun to do well. At first, for a week or two, a little shelter from the hot sun is best. Currant, Gooseberry, Rose, Honeysuckle and other cuttings of hard wood plants, should have the leaves cut off before planting. Soft wood plants, such as Geraniums, Fuschias, etc., will grow best with the small leaves left on. Give all cuttings plenty of water.

Layering by bending the branches of plants down so as to cover a portion of the stem with earth without its being first entirely severed from the plant, can also be done with advantage this month. Budding should be done also. Persons who do not understand layering and budding should get some one to show them, or procure an illustrated work on the subject. It is simple and easy enough when once understood.

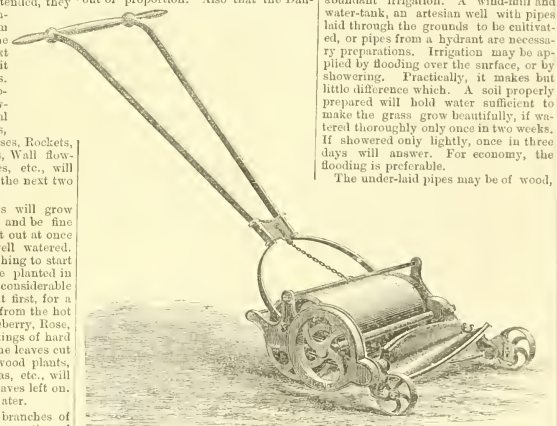
September and October are months in which you can transplant evergreen trees or plants. Of course, we mean such as have been grown in pots or boxes, or such as are carefully taken up with a ball of earth attached about the roots. It is necessary that the earth should be kept continually moist about the roots after transplanting. The first ten days it is well to shelter from the hot sun. This can be done by wrapping the whole tree loosely in sacking, tied to stakes on either side. Transplanted this month or in October, the tree will form new rootlets and become established in the soil before winter, and be ready to grow finely in early spring.

In the article on lawns, it will be seen that we advise the sowing of new lawns this month, if plenty of water can be supplied.

Prune away all dead plants, rusty branches, and withered flowers and leaves, if you want to keep your gardens looking fresh and bright. A little care in this direction will make a great difference in the appearance of your flower beds.

What we have said before about watering abundantly, should apply this month also, particularly during hot weather, of which we always get a week or two in September.

See that the climbing plants and vines are strongly supported so as to not hang out of proportion. Also that the Dahlias and other heavy late flowering plants are tied to stiff stakes, to prevent the wind from breaking and twisting them down.



CENTRAL PARK LAWN MOWER.

You can plant out bed and walk edgings of Primroses, Violets or other plants this month, if you wish nice blooming plants early, and a fine winter garden as well. Plant Strawberry beds for early fruiting.

THE LAWN.

There is no prettier feature about a dwelling than a nice grassy lawn. There are many of them in San Jose, but generally only in front of the most costly residences. Now there is nothing so very expensive about a lawn as to prohibit common people from having them, and enjoying the green carpet where the children can rollic in sportive glee, and the eye can rest relieved from the general glare of desert brown of the hills and stubble fields at this season. Every household can have its oasis to give life and cheerfulness to its surroundings. Quite as much as they need money to supply necessities, do our farmers and the people generally need to cultivate the æsthetic tastes, and to gain the serene enjoyments of tasteful homes and places which a little time pleasantly given can as well procure as money can. The enjoyment of self-satisfaction arising from such effort is something that money can not purchase.

One of the main necessities for a lawn is plenty of water, for grass cannot make a thick sward and keep a fresh growth of living green, in our climate, without abundant irrigation. A wind-mill and water-tank, an artesian well with pipes laid through the grounds to be cultivated, or pipes from a hydrant are necessary preparations. Irrigation may be applied by flooding over the surface, or by showering. Practically, it makes but little difference which. A soil properly prepared will hold water sufficient to make the grass grow beautifully, if watered thoroughly only once in two weeks. If showered only lightly, once in three days will answer. For economy, the flooding is preferable.

The under-laid pipes may be of wood, with plugs at intervals to draw out and allow the water to flood the surface. Once prepared, a lawn is no trouble, but a continual pleasure. The grass you will clip from it the year round will more than pay for all the trouble. Indeed, as an investment, on every farm, a liberal sized lawn can be *made to pay* by supplying soiling for the cows and horses the year round. A half acre will supply many tons of sweet green feed, if richly dressed with manure occasionally, and well watered through the dry season.

The Central Park lawn mower, which we illustrate on this page, is simple in construction, cuts easily, and in dry or green grass, long or short. It costs $20 to $25, and will last a lifetime.

We are indebted to Mr. R. J. Trumbull, the San Francisco seedsman, for the use of the cut and for some

PRACTICAL HINTS ON MAKING A LAWN:

1—Soil should be deeply and thoroughly pulverized—making it rich with well-rotted cow (the best) or horse manure. If the soil is naturally rich, a good quality of manure will still improve it.

2—Care should be taken to have a smooth surface—permitting no depressions anywhere, where water might stand. If the lawn is intended to be flat, it should be made as smooth as possible before sown.

3—A lawn may be made at any time in California, but the most propitious period is from the first of September till the 15th of November, or between February 1st and March 15th. If made during warm, dry weather, after the seed has been sown and raked in it should have a top dressing one inch thick of well-rotted, finely-pulverized manure, which serves to protect the seed during germination and making its first roots. This dressing will stimulate growth of grass at any time, and might be advantageously used no matter at what period seed is sown.

4—There are several varieties of grass used for the formation of lawns, but the more acceptable are the best quality of Blue Grass sown alone, the same with a proper proportion of White Sweet Clover, and the Mixed Lawn Grass, which is composed, as its name indicates, of several fine grasses mixed in suitable proportions.

5—The quantity of seed sown should be in the proportion of at least fifty pounds to the acre. The seed cannot be sown too thick, but if sown too light the work must be done over again. The point is to get a thick stand to withstand our dry climate, and keep the lawn close and preserved from bunching.

6—To make a fine, thick, velvety lawn, the grass should be cut once a week, or oftener, according to the season.

[We supplement the above by adding that for heavy soil it is a good plan to cart sand to cart sand to mix with the top dressing of manure. Also that after the soil is manured and thoroughly stirred by repeated plowing and harrowing, and leveling, it should be heavily rolled down before the seed is sown. Remembes that once well prepared and properly seeded down, etc., a lawn is easily cared for ever after. Blue Grass or Red-top makes the best lawn. All weeds should be pulled out by hand until the sward is firmly rooted.]

Drying Fruit.—Now is the season for putting up fruits for the year, canning, drying, preserving, etc. Sun dried fruit, when rightly done and well prepared, is good enough for anybody. Put up before it is quite hard, in small, tight boxes, press it in firmly, and seal up so that the moths cannot enter. The trouble from moths is not from eggs laid before or during the drying, but after it is packed away. If securely sealed, it keeps fresh and cannot get wormy.

California Agriculturist
AND
Live Stock Journal.

☞ We are determined to adhere to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, renders this Journal a choice medium for reaching the attention of the masses.

Notice to Eastern Advertisers and Advertising Agencies.

☞ Hereafter no proposition for advertising in this journal will be entertained without pay in advance. Our published rates are the standard for all.

EDITORIAL NOTES.

Remember the poor publisher and printer when you realize on your crops.

The premiums we offer are chosen by experienced artists, and are not cheap john importations. Our arrangements cannot be excelled by any for getting nor for giving first-class, choice premiums to subscribers.

The first rains generally catch a lot of wheat belonging to some farmer Slack out of doors unsheltered. It probably would if it did't commence until Christmas. The prudent man will not be caught out in the wet in any such way.

Poisoning Squirrels.—This is a good season to poison squirrels. They are ravenously fond of melons and fruit. Strychnine put into these and placed within their reach will slay them most completely. First bait them with melons or fruit not poisoned. After their shyness is allayed give it to them good and strong, and you will be gratified with success. Be sure that domestic animals are securely fenced away from the poison.

Dry sowing does well enough in soil which has never been plowed when too wet, so that it lays in clods. The soil should crumble nicely, or lay till it can be pulverized when moist. Very weedy land should be allowed to lay till the weeds start, then be plowed under before sowing. Dry sowed land should be rolled as soon as the rains soak the surface to crush all clods, then harrowed with a slanting-tooth harrow to loosen the surface before the grain gets six inches high.

Capital vs. Enterprise.—We often hear the remark that capital and capitalists are needed to build up business and make times lively. There never was a greater mistake, so far as the general prosperity is concerned. Wherever capital controls, a few get rich perhaps, but it is at the expense of the masses. There must be deprivation and poverty among the laboring people where wealth commands labor through high interest and low wages. The more the common people depend upon accumulated capital, and are controlled by it, the greater will be the rates of interest and the lower and more uncertain the labor, both as to wages, opportunity to work, and quality of service. Go into a community where there are no rich men who live upon other's earnings, where everyone is depending upon labor and enterprise for success, and all are striving in a nearly equal race to get on in the world, and there you will find a place rapidly building up, wages good, work plenty, and all sorts of business flourishing. Money will be plenty, because not hoarded. When men count the interest on their money they are penurious, exacting, hard, and anything else but enterprising, as a rule. They are not the tradesman's best customers, nor the business man's supporters and friends. They are drones, eating the best honey, producing none. Their money is drawing the life blood of labor; they are rich, and everybody else is poor from paying tribute to their wealth. In our condition of civilization, we need capital, that is, money, of course. But we do not need any number of rich persons to control all the money and ride industry to death. He who is the most independent of capitalists, pays no interests, works for himself, and commands his own wages, is best off, everything else being equal.

Good prices for wheat and ready sales for cash would make good times in California. The present low prices and dull sales make everything terribly hard. The merchant and mechanic experience the effects of the low prices even more than the farmers themselves; for it is upon the money the farmer puts into circulation that they chiefly depend We are told by dealers in San Jose that for years there has been nothing like the scarcity of circulating coin as at present. It is not upon capitalists that they depend for trade but upon the working people, who buy when they have money to buy with. Every merchant and storekeeper, and every mechanic and business man should join with the farmer in word and action to break up the wheat ring that is bearing down the wheat market. The condition of crops in Europe and America this year should justify at least $2 per cental for wheat in California, and we think not less than $2.25, and active demand. The wheat ring that will either rule or ruin, and ruin if it rules, keeps the price to near, and below, $1.50 per cental, and pays little cash down at that. The farmer is at their mercy, and everybody suffers. At least $10,000,000 are kept out of circulation, and $6,000,000 are actually swindled out of our producers by the speculators.

When our merchants and mechanics fully realize what THEY are losing in allowing this stupendous ring to control wheat matters, they will in every way encourage and assist the farmers and Grangers in breaking it up. The very life of trade of all kinds depends on the prosperity of producers. The money obtained by them is soon put into circulation, through merchants, mechanics and the laboring masses. The wheat ring on this coast must be broken, or ruin will stare many a worthy business enterprise in the face, and everyone will feel the general depression.

Providing fuel for the year is now seasonable work. The rains will send you to the fields. Haul your wood, prepare it for the kitchen, and shelter it from the weather. This is a matter of economy that pays in more ways than one.

Use the Manure.—Now is the time to grther up all the manure about your yards and stables and haul it upon the land. Dump in piles at convenient distances to be spread upon the soil as soon as the first rains. Or it may be spread at once and harrowed or chisled in upon volunteer grain land. It is better to rot upon the soil one season in this way than to be plowed in at once.

Make plans and calculations about what fencing is needed, and haul your posts, planks and pickets early. If your wheat market lies in the same direction, "kill two birds with one stone" by bringing a load on the return trip. The best and cheapest farm fence in our valley is made of square, split redwood pickets, driven firmly in the ground. Two 4-inch boards are nailed upon them, one near the center, and the other near the top, making a handsome, strong and durable fence.

Don't neglect to stack your straw. It is a wicked waste to burn it or let it rot in the rains when there are so many head of stock in the country that need it. If well stacked it will last good a dozen years, and may eventually prove a bonanza in some coming dry season. Save it. After building a stack and ridging it with a heavy scantling, rake the roof down very thoroughly, and re-rake until it will shed water perfectly.

As a rule, our California farmers make no use of the manure that accumulates about the stables and yards. We know of a farmer near San Jose that counts himself a good farmer, who allows his neighbors—poor fellows—to haul the manure from his place onto their own, and is glad so easily to get rid of it! We are glad to be able to say that the men who use manure take the AGRICULTURIST, while he who gives it away "can't afford to take so many papers—has no time to read."

The Angora Robe and Glove Company of San Jose are increasing their capital stock and making preparations to go still more extensively into the bdsiness. Their enterprise, though new and in some directions experimental, has proved a success financially and otherwise. Their goods are now sold in every county and in many principal stores in the State. Their harvest gloves, manufactured from goat skins, are pronounced by all just the thing, and something much needed. Their genuine black kids for ladies and gentlemen are in demand faster than they can be made. Mr. Welch, the experienced dyer, made a good hit on coloring kid skins. The tanning process is also new and wonderful. During a late visit we saw a lighted match touched to the tanning vat when an inflammable gas that is evolved during the process of tanning burst out from among the submerged skins at a furious rate. The skins tanned by this "fire process" are as soft and pliable with the grain on as the softest buck skins are without a grain. The dyeing process used in coloring the glossy fleeces for robes, furs, etc., leaves the mohair as soft and silky as possible. Any color or shade, from a light beaver to a glossy black, is given the fleeces—to suit the various tastes. The fur gauntlets from fine skins resemble the valuable furs of various animals. The Company have lately sent a full line of their goods to Philadelphia to show at the Centennial, and propose establishing a house East for the wholesaling of their goods. Not only will they tan and manufacture into articles the Angora fleeces and skins, but they will work buckskins and such other valuable skins and furs as can be obtained on this Coast. The business, for Angora goods alone, is a most promising one, and one which is of great benefit to all breeders of these animals. As the production of mohair increases, there is promise of a factory, or machinery in our woolen mills, to work this beautiful production into such cloths and fabrics as are in demand all over the world.

Capital and Labor.—There should be no conflict between capital and labor. There would be none were money shorne of its power to extort enormous rates of interest. Were money as much of a servant as labor is, there could be no antagonism. While money is king, and labor is its slave, there must and will be antagonism. Man's sense of justice and love of liberty must revolt against a condition that degrades him because he is poor and honest and works for a living. The natural remedy for this unnatural condition of the supremacy of wealth, is to make money so plenty, and rates of interest so low, that everyone can command through honest labor what he needs, without supporting others in idleness. Should the people, through Government, issue in abundance a standard money, payable for all obligations, and protected from speculation by stringent laws, and allow individuals to draw it at low rates of interest, upon pledges of their real property, to an amount representing the same, money would soon become so plenty, at cheap interest, that those who accumulate money could not extort a living from others. It would place labor and enterprise where it ought to be, and promote honesty by encouraging industry of every description. Idleness would not be enforced for want of employment, nor labor poorly paid for want of patronage and from inability to meet payments of taxes, interests and rents on the part of employers. Capital and labor would have no occasion to be at war. An honorable peace would be established. The rich man and the poor man could be friends without either making concessions to the other.

A BETTER FINANCIAL SYSTEM NEEDED.

ED. CAL. AGRICULTURIST: I have received several numbers of your journal. Inclosed please find a postal order, and continue the journal as long as that will pay. I am taking several (eleven) papers and journals, and have asked several persons to take the AGRICULTURIST.

I notice an occasional article on finance, recommending the American system, that is, paper money that will pay all debts, dues, duties, taxes, etc., and that the Government won't repudiate for customs, and which will always, therefore be at par; also be interconvertible into bonds drawing a small interest—at the same time doing away with the National Banks. Of course, a few thousand bankers and money-lenders will howl, but millions of laboring people will rejoice and be made happy. More financial information should be circulated among the laboring classes. Even farmers stand more in need of financial than of agricultural information.

Petaluma, August, 1876. F. P.

Poetry.

Tom's Come Home.

BY T. J. TROWBRIDGE.

WITH its heavily rocking, swinging load,
The stage coach rolls up the mountain road;
The mowers lean on their scythes and say,
"Hullo! what brings Big George this way?"
The children climb the slats, and wait
To see him drive past the door-yard gate;
When, four in hand, sedate and grand,
He brings the old craft like a ship to land,
At the window, mild grandmotherly eyes
Beam from the glasses with quaint surprise,
Grow wide with wonder, and guess, and doubt;
Then a quick, half-stifled voice shrieks out,
"Tom! Tom's come home!"

The face at the casement disappears,
To shine at the door, all joy and tears,
As a traveler, dusty and bearded and brown,
Over the wheel steps lightly down.
"Well, mother!" "My son!" And to his breast
A forward-tottering form is pressed
She lies there, and cries there; now at arms-length
Admires his manly size and strength
(While he winks hard one misty eye);
Then calls to the youngsters staring nigh,
"Quick! go for your grandther! run, boys, run!
Tell him your uncle—tell him his son—
Our Tom's come home!"

The stage coach waits; but little cares she
What faces pleasantly smile to see
Her jostled glasses and nodded cap.
Big George's hand the trunk unstrap
And bear it in; while two light-heeled
Young Mercuries fly to the neighbors' field,
And shriek and beckon, and meet half-way
The old gran'ther, lame and gaunt and gray,
Coat on arm, half in alarm,
Striding over the stony farm.
The good news clears his cloudy face,
And he cries, as he quickens his anxious pace,
"Tom? Tom come home?"

With twitching cheek and quivering lid
(A soft heart under the hard lines hid),
And "Tom, how d'e do?" in a husky voice,
He grasps with rough, strong hand the boy's—
A boy's no more. "I shouldn't have known
That beard." While Tom's fine baritone
Rolls out from his deep chest cheerily,
"You're hale as ever, I'm glad to see."
In the low living porch the mother stands,
And rubs her glasses with trembling hands,
And, smiling with eyes that bleer and blink,
Chimes in, "I never!" and "I'd only think!
Our Tom's come home!"

With question and joke and anecdote,
He brushes his hat, they dust his coat,
While all the household gathers near—
Tanned urchins, eager to see and hear,
And large-eyed, dark-eyed, shy young mother,
Widow of Tom's unlucky brother,
Who turned out ill, and was drowned at the mill
The stricken old people mourn him still,
And the hope of their lives in him undone:
But grief for dead sons, the maimed son—
Their best-beloved and oldest boy—
Is all forgotten or turned to joy,
Now Tom's come home.

Yet Tom was never the favored child,
Though Tom was steady, and Will was wild;
But often his eyes and his brother's share
Of blows or blame he was forced to bear;
Till at last he said, "Here is no room
For both of us!" And he left home.
Scant grace was shown has proved the one
Large-hearted, upright, trusty son;
And well may the old folks joy to find
His brow so frank and his eye so kind,
No shadow of all the past allowed
To trouble the present hour, or cloud
His welcome home.

His trunk unlocked, the lid he lifts,
And lays out curious, costly gifts;
For Tom has prospered since he went
Into his long self-banishment.
Each youngster's gies, as he hugs his share,
The widow's surprise, the old folks' ar
Of affectionate pride in a son so good,
Thrill him with generous gratitude.
And he thinks, "Am I that lonely lad
Who went off friendless, poor and sad
That dismal day from my father's door?"
And can it be true he is here once more,
In his childhood's home?

'Tis hard to think of his brother dead,
And a widow and orphans here in his stead—
So little seems changed since they were young!
The row of pegs where the hats were hung;
The checkered chimney and hearth of bricks;
The sober old clock with its lonesome ticks
And shrill, loud chime for the flying time;
The stairs the bare feet used to climb,
Tom chasing his wild bedellow Will:
And there is the small, low bedroom still,
And the table he had when a little lad:
Ah, Tom, does it make you sad or glad,
This coming home?

Tom's heart is moved. "Now don't mind me;
I am no stranger guest," cries he.
"And, father, I say,"—with the old-time laugh—
"Don't kill for me any fatted calf
But go now and show me the sheep and swine
And the cattle—where is that colt of mine?—
And the farm and crops—is harvest over?
I'd like a chance at the oats and clover!
I can mow, you'll find, and cradle and bind,
Load hay, stow away, pitch, rake behind;
For I know a scythe from a well-sweep yet.
In an hour I'll make you quite forget
That I've been from home."

He plucked from its peg an old farm hat,
And with cordial chat upon thisand that,
Tom walks with his father about the place,
There's a pensive grace in his fine young face
As they loiter under the orchard trees,
As he breathes once more the mountain breeze,
And looks from the hill-side far away,
Over pasture and fallow and field of hay,
To the hazy peaks of the azure range,
Which change forever, yet never change.
The wild sweet winds his welcome blow;
Even old Mountain-Locke seems to know
That Tom's come home.

The old man stammers and speaks at last:
"You notice your mother is fail ng fast,
Though she can't see it. Poor Will's disgrace
And debts, and the mortgage on the place;
His sudden death—it was a dreadful blow;
She couldn't bear up like a man, you know.
She's lulled of you since the trouble came;
Some things in life no one sense to blame
Herself for; what, it is hard to tell.
I marvel how she keeps round so well,
For often she lies awake.
I'm thankful, if only for her sake,
That you've come home."

They visit the field: Tom mows with the men;
And now they come round to the porch again.
The mother draws Tom aside; his sink
Her voice to a whisper low, "and you think?
"You see," says she, "he is broken quite.
Sometimes he tosses and groans all night,
And—Tom, it is hard, it is hard indeed!
The mortgage, and so many mouths to feed!
But tell him he must not worry so,
And work so hard, for he don't know
That he hasn't the strength of a younger man.
Counsel him, comfort him, all you can,
While you're at home."

Tom's heart is full: he moves away,
And ponders what he will do and say.
And now at evening all are met,
The tea is drawn, the table set;
But when the old man, with bended head,
In reverend, fervent tone has said
The opening phrase of his simple grace,
He falters, the tears come down his face,
For the words seem cold, and the sense of the old
Set form is too weak his joy to hold;
And broken accents he can express
The upheaved heart's deep thankfulness,
Now Tom's come home.

The supper done, Tom has his say:
"I heard of some matters first to-day;
And I call it a shame—you're both to blame—
That a son who has only to sign his name,
To lift the mortgage and clear the score,
Should never have had that dread before.
From this time forth you are free from care;
Your troubles I share; your burdens I bear.
So promise to quit hard work, and say
That you'll give yourself a holiday.
Now, father! now, mother! you can't refuse;
For what's a son for, and what's the use
Of his coming home?"

And so there is cheer in the home to-night.
It can hardly hold so much delight.
Tom wanders forth across the lot,
And under the stars (though Tom is not
So pious as boys often have been)
Thanks Heaven, that turned his thoughts from sin,
And blessed him and brought him home once more.

And now he knocks at a cottage door,
For one who has waited many a year
In hope that thrilling sound to hear,
Who, happy as other hearts may be,
Knows well there is none so glad as she
That Tom's come home.
—[Harper's Magazine for September.

Slow and Sure.

Upon the orchard rain must fall,
And sunlight every branch to rout;
And blossoms bloom and fall withal
Before the fruit is fruit.

The farmer needs must sow and till,
And wait the wheaten bread,
Then cradle, thresh, and go to mill,
Before the bread is bread.

Swift heel may get the early shout,
But, spite of all the din,
It is the patient holding out
That makes the winner win.

To a Grasshopper.

Tiny, pea-green harlequin!
What of wonder can describe
All your odd, gymnastic tribe,
To the kangaroo akin?
Unless Darwin goes amiss,
With his queer hypothesis.

Chirping chimer, clover climber,
Insect athlete! never stumbling,
In your ground and lofty tumbling.
Strange it is a thing so fragile,
Should be so extremely agile.

Go it, then, spasmodic leaper!
Seize your pleasure while you may:
Blow your horn and have your day;
When the primrose days are over,
And all dead are vines and clover,
That austere, remorseless reaper,
Time, will turn us all to hay!

When October,
Like a varlet,
Robs the woodland's summer dress;
And the maple, blushing scarlet,
As the ruffian winds disrobe her,
Shrinks in timorous distress;
When no longer leans the lily
By the mill-pond's mossy edge,
And an influence damp and chilly
Blasts the rose and daffodilly,
And the vines along the ledge—
Then the cricket
Leaves the thicket
To creep under kitchen rugs;
Then, O grasshopper!
Unique acrobatic vaulter,
Your frail powers will fail and falter;
And some chill, autumnal morning,
Sting, dying,
Without warning,
You will find it useless trying
Leaping, creeping, singing, flying;
With some early robin waiting,
Cool and calm, and aggravating,
Like some grim and hungry wizard,
Obviously deliberating
When to pop you in his gizzard.
Farewell butterflies and clover,
Death is fate the wide world over.
—[Golden Rule.

A Hundred Years Ago.

BY NATHAN D. URNER.

While aliveest every day, just now,
Some great event we celebrate,
That surged about the hundred prow
Of freedom's infant ship of state—
Through fire and smoke and glad huzzas,
Through cannon's crash and bonfires glow,
A vision springs of men and things
A hundred years ago.

They had not then the railroad speed,
The lightning interchange of thought,
Nor half the needs we have of greed.
That with the present age have wrought;
But news was news, though slower sped,
No headlong thoughtless care had to go,
And ruder hands fed men's demands,
A hundred years ago.

No mighty cities reared their spires,
No proud, palatial homes were theirs,
They had not then our grand desires,
Our railway sloe and summer shares;
But they had thrifty towns and homes,
Had hearths with health and faith aglow,
And earnest toil brought goodly spoil
A hundred years ago.

Our age can theirs with ease surpass
For air and steam, and other powers;
They lacked the gas and glass and brass
That mark this rapid age of ours;
But they had eyes as keen and bright,
And faculties as rare, I know,
And wholesome rests, and manly breasts,
A hundred years ago.

And if they gave us not the vim,
The dash and polish we have gained;
If life with them was dull and dim,
Of humbler hopes and tastes restrained,
The mighty land which is our pride,
Our nation's birth, to them we owe
Who lived and thought and wrought and fought
A hundred years ago.

Now, while our glad centennial fires
Through all our country blaze afar,
God bless our strong, heroic sires
Who molded us to what we are!
Nor shall their glory be forgot
While pa riot blood shall course and flow
As filled the veins and fired the brains
A hundred years ago.

A MOTHER told her seven-year old boy, never to put off till to-morrow anything he could do to day. The little urchin replied, "then, mother, let's eat the rest of the plum pudding to night.

Domestic.

SEASONABLE RECEIPS.

Original, or Such as Have Been Proved Good by Trial.

EFFECT OF LIGHT ON CANNED TOMATOES.

IT will be interesting to every housekeeper to know that tomatoes will not keep if put up in glass jars, since the exposure to light causes them to ferment, but if sealed neatly in bright tin cans will keep perfectly sweet. Yeast is effected by light in the same manner. Anyone troubled with having bread turn sour should be careful to keep their yeast in a stone jug. If in glass, it should be placed in a dark closet.
HOUSEKEEPER.

[Would it not be just as well to put tomatoes in glass and *wrap each jar in paper* so that the light cannot get to the fruit? Unless the tin is *new*, the acid from the tomatoes will be likely to corrode the metal and poison the tomatoes. We prefer glass for all kinds of tart fruits. Tin should not be used the second time, if used at all, is what our good wife says.— ED.]

FRICASSEED TOMATOES.

Place the tomatoes in a stone jar, and put it into a steamer. When they are tender, beat them to a pulp and put into a stew-pan with a little onion (which has been minced and stewed in butter until it is tender), a seasoning of pepper and salt, and some chopped parsley; simmer the mixture for a few minutes, and serve it very hot. It is good either alone or served in the dish with chops, or other meat, sausages or fish of any kind. Tomatoes and sausages are capital. Fry the sausages and arrange them in the dish in front of the fire. Cut the tomatoes into slices with some onion thinly sliced; fry them, season them with pepper and salt, place them among the sausages, and serve them hot. In the same manner they are excellent with anything warmed a second time—chicken, rabbit, game or pork, cold meat in slices, or fish of any kind.

TOMATO SAUCE.

To four quarts of bruised tomatoes add half a pound of salt, and allow to stand for three days, then express the juice. To each half-gallon on juice add 4 oz. of shallots, and ¼ oz. black pepper; boil for an hour; strain and add mace, allspice, ginger, nutmeg, of each ½ oz., coriander (and, if desired to impart color, cochineal) of each ¼ oz. Simmer gently for half an hour, strain, and, when cold, bottle it.

TOMATO PIES.

Take ripe tomatoes, peel and slice. Sprinkle over a little salt, and let them stand a few minutes; pour off the juice, and add sugar, half a cup of cream, one egg, nutmeg, and cover with a rich paste, and bake in a moderate oven over half an hour. This makes an excellent and much approved pie.

DRYING CORN.

Corn, when at its best for eating, will shrink little when boiled, and when cold will shell easily with the hand. Boil fifteen minutes; cool, or nearly cool it; shell it from the cob; mingle a large quantity of fine salt, the moisture from the corn will dissolve it; place in a shallow pan; the salt extracts the water from the corn, it shrinks, and a short time in the sun finishes it. Hang it in paper bags. When used, wash off the salt, and

let it stand on a hot stove over night, change the water and heat again. The corn is as sweet as if fresh from the field. Lovers of sweet corn, try it; you will never buy the slop they call "canned corn."

FRIED APPLES.

Take nice, smooth tart apples, wipe clean and slice across the core. To one dozen apples use two tablespoonfuls of lard or suet. Pour over a cup of water when in the frying pan, cover tight and let them simmer over a moderate fire till done. Try with a fork, but do not stir them. Sprinkle over two tablespoonfuls of sugar, and serve without breaking the slices. This makes a neat and palatable dish.

PICKLED ONIONS.

Choose small button onions, as nearly the same size as possible, peel them and pour on strong, boiling hot brine; drain them from the brine; wipe them dry and put them into cold vinegar, with whole pepper, bruised ginger root, blades of mace and sliced horse-radish. Keep them covered with vinegar, close the jar tightly, and set in a cool, dry place.

PICKLED APPLES.

Three pounds of sugar, seven pounds of apples quartered and cored, one pint of vinegar. Steam the apples till a fork will go through them readily. Then make a syrup of the sugar and vinegar and pour over them while hot. Stick a clove or two into each quarter. Very nice.

PICKLED PALMETTO ROOTS.

Florida is to give the world a new condiment in the shape of pickles made from the pith or bed of the palmetto roots, which are said to be superior to cucumbers for the purpose.

TO FILL FRUIT JARS.

To prevent breaking glass jars when putting hot water or fruit into them set your jar on a wet towel or napkin folded several thicknesses together. This is very simple, easy to remember and to do, and will insure glass from cracking.

LABELS ON TIN CANS.

A spoonful of sugar in a pint of paste will make labels adhere to tin as well as to wood.

HOUSEHOLD PESTS.

COCKROACHES.

A lady inquires: "What is the best thing to drive away cockroaches? I am living in San Francisco, and my pantry is infested with them. I have tried almost everything I can hear of, but with only temporary success."

Borax is the best cockroach exterminator yet discovered. This troublesome insect has a peculiar aversion to it, and will never return where it has once been scattered. As the salt is perfectly harmless to human beings, it is much to be preferred for this purpose to the poisonous substances commonly used.

Another recipe: Take dry red lead; mix with thin molasses to a consistency of thin cream; then take pieces of glass and broken plates, etc., spread it on about as thick as thin window glass. Where roaches are very numerous, give them plenty of the mixture, as they eat very greedily of it. I think the general failure with roach poison is this: The poison is so quick in sickening the roaches that they will not eat enough of it to kill them, for they are slow eaters. The red lead being slow in its effect on them, they will get a good quantity into them before it will sicken them. I have notice when any of them would happen to be trampled upon, it would appear that they were entirely filled with the red lead. Place the lead where the roaches can get at it most conveniently. If the lead should become too dry and hard, mix a little more lead and molasses with the old to freshen it up again, and put it in different places.

RED ANTS.

Correspondents of the *American Grocer* having inquired what to do to rid premises of red ants, that paper called upon its readers for their methods. Several of them replied, a majority naming camphor gum as the best thing to use. Place in a thin muslin bag and hang up about the places infested. One has used successfully a cord saturated with spirits of camphor. Another has used elder leaves scattered about the shelves and boxes with good success.

OTHER INSECTS AND EXTERMINATORS.

Mercury exterminates fleas and bugs. Cleanliness is the best preventive. The common housefly more than compensates for its trouble by clearing the atmosphere of effluvia and the animalcules which always arise from the putrefaction of decaying substances during warm weather.

Twenty-five cents' worth of cobalt—a mineral poison in black powder—will last to kill the flies about a house for a whole year. Put a spoonful into a saucer or soup-plate and keep the dish half full of water sweetened with sugar. Set where the flies will get at it.

Birds capture a large share of the insects in the larva state, and thus the millers are prevented from depositing their eggs for future worms. As to the loss of fruit by the birds, the latter are always sure to be on hand in force in the season of ripe fruit, whether they come early to take the worms or not.

For insects that infest the vegetable garden, the laboratory of the chemist furnishes materials fatal to them all, among which white hellebore and cayenne pepper are of the most utility. The bug or worm that cannot find vegetation unflavored with these articles will seek its breakfast elsewhere and leave such a garden unmolested.

A few drops of carbolic acid in a pint of water will clean house plants of lice in a very short time.

If mosquitos or other blood-sucker infest sleeping rooms at night, uncork a bottle of pennyroyal, and these insects will leave in great haste, nor will they return so long as the air in the room is loaded with the fumes of that aromatic herb.

Common coal oil is an excellent mosquito bar. Drop a little on a piece of cotton, squeeze as dry as possible, and rub over the exposed portions of the body. The smell of the oil disappears in about five minutes, and no mosquito will alight upon the anointed places. This is said to be better than pennyroyal for the same purpose.

If rats enter the cellar, a little powdered potash thrown into their holes, or mixed with meal and scattered in their runways, never fails to drive them off.

A correspondent of the *Gardener's Monthly* says the simplest plan to use kerosene to destroy insects is to make a moderately strong soap suds and mix with it a little oil. It readily combines with suds and can be applied with a syringe. It is the best thing for mealy bugs, and may be used in dilution suited to the nature of the plant requiring treatment.

☞ We have received from M. L. H. Hare, local agent, samples of preparations of Ventura Rock Soap, which we have tried and can cheerfully recommend. We consider it without an equal.

Educational.

EDUCATION AND LABOR.

Ed. Agriculturist: The "Groundswell" complains that the "higher system of education has tended to bring labor into contempt." If the statement were not terribly true, I should resent it as an insult to educators. But is not that system only *nominally* "higher," but really *lower*, which tends to bring any duty into disrepute? What is a teacher but a laborer, and if he does his whole duty, a hard laborer?

At a time when manual labor is struggling against oppressive monopolies and the degrading sentiment of aristocracy, it is the especial duty of the teacher to stand by the right, and to inspire in the minds of his pupils a love of true republicanism—true democracy—to teach that

Honor and shame from no condition rise;
Act well your part—there all the honor lies.

No; it is not higher, but lower—the very lowest—education that tends to bring labor into contempt. The teacher whose influence tends thus to poison the minds of his pupils, is ignorant of the simplest principles of life and its duties, and should at once give place to one of more honest ideas. A Teacher.

Plain Talk to Farmers.—The farmer must depend upon two classes of help—his family and hired hands. These two classes differ, or at least they ought to differ, widely in their feelings in performing their work. The hired laborer serves for money alone, and though he is under moral obligation to perform faithfully his honest work, whether he will do it when the eye of the master is not upon him, depends upon his moral disposition and development. But with regard to the co-operation of a man's family—his wife and children—in earning a competence for all, the case is far different, or ought to be. This co-operation ought to be inspired by love and common interest, and where this is not the fact, success cannot be attained, as a general rule. Where a man receives no cordial sympathy from his wife and children in making a support for them he is crushed by a power that he cannot resist. Perhaps the keenest pang ever felt in this life, by a noble nature is the consciousness that there is no tie in the family—no sympathy with the husband and father in making a living—that wife and children are as boarders, or strangers, that they hold him as a slave, and are not even grateful for what they receive. A man who sees this spirit in his family, and does not become morose or dissipated, is made of better material than most persons. When the reverse of this is the case, where a man receives from his children the powerful—we had almost said the omnipotent—support of love and cordial co-operation, he is a demon of the pit if he withholds from them his best efforts.

The duties of the domestic institution of the several members of the family, need a more thorough exposition than the religious ethics of the day afford. The disposition to shun work, to live without it in ease and luxury, is one of the bad characteristics of the time. Our system of education is not calculated to remove this evil. The religious teaching of the age is not a remedy for it. In fact, our system of schools, or the spirit which inspires them, and the general religious influences of society, help augment the spirit of idleness and extravagance. There is a certain dash or spirit of society which renders the cordial co-operation of the farmer's family impossible. A man who has several boys who will not work steadily and heartily, has a bad chance to make the farm pay. If the community but knew the amounts of many a farmer's bill for dry goods, groceries, millinery, mantua-maker and jewelry, the secret of ill success would be apparent, yet the pride of human nature will conceal these drawbacks, and only the thoughtful among men consider this source of ruin. The fact is perfectly well known to merchants, grocers and other business men. The extravagant purchase of goods of one kind and another, eat up the profits of the farm. Nor is this all—it discourages the farmer, and casts a dark shadow over the business. The prevailing styles of living cost too much, and none but the very rich can indulge in them. A wife is not exempt from household duties and labor. A woman who feels herself to be exempt from domestic duties is not fitted to be the wife of any working man. Work is necessary to the support of a family. The wife and the mother who declines and shrinks from it, is false to her affections, false to her duties, false to the law of agricultural prosperity. The farmers' daughters should work in their department. They can raise poultry, do their own sewing, keep the house. Many of the farmers hire all the house help. Wife and daughters sleep till breakfast is ready. Great, big, ruddy sons lie abed till the sun is high in the heavens, and then go to town to spend the day in idleness. The children of many farmers in this country are idle. They are for the most part consumers, but not producers. The daughters of well-to-do farmers in these days are not so generally co-operants in making the common blessings they ought to be. Everywhere work is shirked. The popular idea of a lady or gentleman is to live in splendor without work. Why should a man not work? Can he give a good reason for living at all without work? Can a good reason be given to raise a girl without work—the work of her department? The son who will not work is unfit to live—he deserves not the privilege of life in the world. All over the country the idleness of farmers' children is a disgrace. Farming does not pay because so many dead-heads hang upon the pursuit. The extravagance of the day is a shame. The rising generation are impotent in regard to self-supporting. The young men of the country are incapable of thrift, because their early training lies in the principles of indolence. We see the sad error of our farmers; they pay for hired help and let their boys go free. The whole subject of domestic economy is ignored. We are fighting against nature—against the Author of the world and the Giver of the harvest. Is it not so?

Farming will pay if it is managed well, but industry is the law of nature; and where a family is idle, nothing but ruin can be anticipated. We want a reasonable system, a sound philosophy, a wise domestic economy, a rigid system of labor for the family, sons, daughters, wife and husband, to work to a common end—the welfare of the family. If we speak plainly, it is because we feel the importance of the subject. Human happiness is involved in this question.—*Live Stock Journal.*

☞ It wouldn't take some persons very long to bury all their friends, but Trueman & Woodrow, who conduct the undertaker's business on First street, make everybody friends by gentlemanly fair dealing, and they surely deserve the confidence and esteem of everybody.

Sheep and Goats.

Angora Goats and Mohair---Criticisms Answered.

(Continued from page 128.)

"It is now fifty years since these goats were tried in France, and they failed there. More than thirty years have elapsed since they were taken to the Atlantic States, to South America, and to the Cape of Good Hope, and in none of these places have they succeeded. They have not been taken in large numbers from Asia Minor to any part of Europe; they have not increased rapidly in Asia Minor; they have not paid enough profit to their owners to raise them out of a social condition so low that it borders on barbarism; and the supply of wool is not increasing. In and near Asia Minor is a region including Syria, Palestine and Armenia, Kurdistan and Transcaucasia, with an area sixty times as large as California, and capable of sustaining not less than 50,000,000 goats; whereas not 10,000,000 are now shorn regularly in the world."

To this we reply: The history of the pursuit shows that the first attempt to appropriate the race in Europe was made by the Spanish government, which imported a flock in 1765. This disappeared. Following this came the importation of the eminent agriculturist, President Tour d'Aigues, who introduced some hundred upon the Lower Alps in 1787, and his experiment, according to his own testimony, appears to have been wholly successful, as he declares that his flocks, without any special care, were constantly preserved in good health, and that "nothing is easier than to raise and nourish the species." This flock, together with one imported by Louis XVI. to Rambouillet towards the close of the last century, disappeared in consequence of the revolution. Better results were obtained in Spain from the importation of a flock of a hundred in 1830 by the King, and pastured in the mountains of the Escurial, where they produced "a magnificent fleece," to quote the words of M. Graells who saw the flock in 1848, when it was 200 strong, all the primitive individuals having disappeared, and those which succeeded them having been born in and naturalized to the climate, the food and other inherent condition of the central region of Spain. The same observer reports another flock of a hundred head at Huelva, also thriving. In 1854 the Imperial Society of Acclimation of France secured a flock of ninety-two head of Angoras, and subdivided it, and placed the goats in different districts. The result was not a success. "Many died, and thsse that survived gave fleeces which were far from satisfactory," says the record of the experiment. In 1858 all the separate flocks were re-united and placed in the mountains and trachytic districts of the Landi, where "the animals rapidly recovered their health and were increased without suffering any malady." The fleeces were pronounced "in admirable condition," and were fabricated into velvets of such fineness that it was declared "the wool of the Angora goat has been ameliorated in France." The increase of this flock was disastrously checked by the rigorous winter of 1859 and the rainy and damp summer which succeeded. M. Richard, writing of the experiment, says: "The goats, always in a damp atmosphere, eating wet grass, contracted as well as the sheep an aqueous cachexy; a third of the animals succumbed from this malady. * * * * The malady was arrested by a tonic and fortifying medication." The flock reduced from ninety-two head in 1855 to seventy in 1862, was at the latter period in good health.

So much for the experiments with the Angora in Europe, which, while not encouraging in all respects, are by no means the failures the *Alta* would have us believe. A useful lesson is to be learned from these experiments, viz: the destructive effect of exposing the Angora goat to a damp climate. This fact is well known among experienced American breeders. To this danger the Angora is not exposed in California.

2. Only about twenty-seven years have elapsed since the advent of this goat in the United States. It was first introduced into South Carolina (not into the "Eastern States," as the *Alta* declares) from Turkey in 1849. From that period up to 1866 no further noteworthy importations were made. It has only been fifteen years since the Angora's first appearance on the Pacific Coast (summer of 1861). In no section of the country was there any extensive and vigorous prosecution of the industry previous to 1866; so that the business, *as a business*, is not thirty, but only ten years old in America. What was the now great Merino sheep interest at the end of ten years from the first introduction of that race into the United States in 1812? and what would have become of it had it been brought up for judgment and condemnation, without a fair trial, in 1812?

3. As to the Cape of Good Hope:—When the Dutch planted a colony at the Cape, they took a few Angoras with them; but during the subsequent war the goats were permitted to run at will with the common goats of the country until the pure stock was lost—swallowed up by promiscuous breeding with the numerically superior plebeian race; not, however, before almost the entire goat stock of the country had become mixed with the Angora blood, so powerful is it for the reproduction of its kind. But the amount of fine blood being altogether disproportioned to the common, owing to the fact above stated that the common stock so largely out-numbered the Angora, no results in fleece were obtained worthy of mention. This is doubtless the failure to which the *Alta* refers, forgetting later facts. The goat herds of the Cape remained in this condition until 1866, when the increasing demand for mohair induced some enterprising Englishmen to ship 400 head of Angoras, mostly bucks, to the country from Asia Minor. About half of these were lost in transit. The remainder were put where they would do the most good, having been thrown among the low-grade ewes of the country for breeding purposes. From time to time since that date (1866) there have been perhaps, in all, six hundred more pure Angoras landed at the Cape by English breeders. What is the result? The Cape now exports over a million pounds of mohair annually, which is regularly quoted in the Liverpool market—all the results of ten years' operations from almost a first beginning.

The exportations of mohair from the Cape of Good Hope to England are given in the commercial statistics as follows:

In 1867	49,000 lbs.
In 1867	97,000 lbs.
In 1869	147,000 lbs.
In 1870	450,000 lbs.
In 1871	1,000,000 lbs.
In 1872 (estimated)	1,500,000 lbs.

The exports since 1872 doubtless show the same ratio of increase, though the figures are not at had at this writing.

If this Cape of Good Hope experiment is a "failure," we should like to see some more failures of the same kind happen in this country.

4. We have no record of any considerable or intelligent experiments with this goat in South America, but have a brief account of their introduction into the colony of Victoria, Australia, in 1856, accompanied by statements that they have thrived there, and have spread to other prts of the continent, where they are now found in fair numbers—notably in the neghborhood of Sydney—producing a fair quality of mohair.

5. If Angora goats have not increased rapidly in Asia Minor, as the *Alta* asserts, there is abundant cause for it in the terrible famines which have afflicted that unhappy country from time to time for years, forcing the starving people to eat their goats or die themselves. The devastating famine of 1874 has not been forgotten by America, though it seems to have been ignored by the *Alta* in its zeal to make a point against the mohair interest. Here is a single paragraph—a compilation in the New York *Sun* of November, 1874, from the Turkish news of that fearful period—that will show better than columns of argument what has become of a large share of Asia Minor's mohair crop. (We think the original publication was probably made by the *Levant Herald*):

"It is estimated that the people who have fallen victims to the famine in Asia Minor number over 150,000. As an instance of the terrible devastation among the cattle and flocks, it is stated that in one village, out of more than 1,600 sheep and goats, just one sheep and one goat remain, and of 100 cows two remain. In another, from a flock of 1,200 sheep and goats, 8 are reported; and from another flock in the same village, numbering 800, of which 700 are mohair goats, the same number, 8, is reported."

This wholesale devastation, it will be observed, was all in two villages. An estimate, made at the time, of the entire destruction of Angora goats in the whole territory of Asia Minor footed up the enormous total of half a million (500,000). And it must be borne in mind that this loss of the precious race was not from disease, but because of famine among the people, causing them to kill their favorites in order to preserve their own lives. Will not the *Alta* admit that there has been some reason why these goats "have not increased rapidly in Asia Minor" in late years?

6. The fact that the people of Asia Minor are in "a social condition so low that it borders on barbarism," instead of being an argument against the profitableness of goat-raising, is strong proof of the incapacity of those people for making this valuable animal yield those large results of which it is capable in the hands of an enlightened people, employing scientific systems of breeding and approved methods of culture. The people of Asia Minor *are* semi-barbarous; nevertheless the mohair goat is their chief support in many districts, and the purest leads all others there, and has done so for more than a century; hence it must be a success, or it would long since have fallen into the back-ground.

7. We consider it hardly necessary to go into a consideration of the inscrutable reasons why that distant and rather shadowy region, that sort of *terra incognito*, "including Syria, Palestine and Armenia, Kurdistan and Transcaucasia, with an area 60 times as large as California, and capable of sustaining not less than 50,000,000 goats," has not got that number, which we freely admit to be the case for the sake of the argument. You might as well ask why the Old Harry the Digger Indians haven't got 50,000,000 thoroughbred Short-horn bulls; and then proceed to argue elaborately and exhaustively that thoroughbred Short-horn bulls are a fraud, a delusion and a failue. But if the *Alta* will just quit that kind of wild figuring and come down in good honest faith to the possibilities within reach right here in California, and help work them out, the editor may live to see this mohair business assume such dimensions that the 10,000,000 goats which he asserts are not now shorn in the world will be clipped here, in the Angora's natural home, on the slopes of the Pacific.

To wind up with, the *Alta* practically surrenders its entire position by publishing the following well-authenticated facts—being some of the practical results in the breeding of Angora goats which have been achieved in California;

"Against this array of facts we have the assurance of several persons that the animals of pure, or nearly pure blood, in this State are hardy, increase rapidly, and yield heavy fleeces of wool, commanding a high price in the market. It is reported that Stockton & Buffum, who have a herd of 550 goats, including 36 of pure blood, near Hornitos, Mariposa county, obtained a ton of wool for last season's shearing. From the California Agriculturist we clip the following figures and remarks about their goats:

"'One pure-bred ewe sheared 7 lbs; one 31-32ds ewe's fleece weighed 7 lbs; a 15-16ths ewe sheared 6½ lbs; a 7-8ths ewe sheared 4½ lbs; five 7-8ths ewes sheared 18¾ lbs; three 15-16ths sheared 17¾ lbs; two 31-32ds ewes sheared 13½ lbs; four pure bred ewes sheared 25¾ lbs. One of their pure bred bucks sheared 7½ lbs, and a pure bred buck kid 3½ lbs, while a grade kid sheared 4½ lbs; twelve kids sheared 39 lbs of fine mohair: three pure bred bucks sheared 20 lbs. But the most remarkable fleeces were the wethers'. One wether sheared 9¼ lbs! ten wethers sheared 76 lbs fine mohair. We must make special mention of the produce of wethers. Evidently they will make the best mohair. The expenditure of vital force incident to breeding, caring for and nursing the young detracts from the fleece production of breeding animals. The wethers keep in more uniform and better order on the same feed, and their fleece is not only fine and heavy, but uniform in texture during its growth the entire year.'

"The same paper obtains the following figures about pure-blood fleeces from C. P. Bailey, who has a herd near San Jose:

"'Buck Romeo 2d, five years old, eleven months' growth of fleece, 8½ lbs; a two-year old buck, one year's fleece, 7½ lbs; ewe, Scotch Woman, six years old, twelve months' fleece, 6½ lbs: ewe, Queen of Monterey, three years old, twelve months' fleece, 6 lbs; ewe, two years old, 5¼ lbs. The above fleeces are worth $1 per pound net. From a flock of 1000 young goats, one and two years old, were sheared 1600 pounds. These were grades from 7-8ths to 31-32ds, and the fleece will average worth 60 cents per pound. Mr. Bailey says that he can get as good results from 31-32ds and 63-64ths as from pure breeds.'"

These few figures have more good square, convincing argument in them than all we and the editor of the *Alta* together have said on the subject. The logic of results is irresistible.

Improved Breeds of Sheep.

As the season of fairs is a good time to compare the different varieties of stock, we copy a portion of an essay read by Dr. L. E. Brown before the Kentucky

Wool Growers' Association, in which brief reference is made to the history and value of the leading and most popular breeds of sheep:

First—The Merino is a breed originally Spanish, but now generally existing over Europe and the United States, and very extensively in Australia. Merino wool constitutes a great part of the wealth which flows into the new continent from its exports. The Merino has large limbs, and the male has large spiral horns which do not rise above the head. The skin of the neck is loose and pendulous, the cheeks and forehead bearing wool. The fleece is fine, long, soft and twisted in silken spiral ringlets abounding in oil which, attracting dust, gives it a dingy appearance until scoured, after which it is silky and white. This variety fattens slowly and is valuable mainly for the excellence of its wool, but as a general thing, has not been found profitable in England or the United States, and is not reckoned by some as being strictly one of the long-wool sheep.

Second—The Leicester sheep is regarded in Europe as one of the most valuable of the long-wools. This breed, in the present improved condition, is the result of the skill and care of Mr. Bakewell of England, who, soon after the middle of the last century, began to make experiments for the improvement of the old Leicester sheep. It was then a large, coarse-boned sheep, not easily fattened, with coarse wool weighing about ten pounds to the fleece. The new Leicester, or present breed, has wool moderately long and of better quality, weighing seven or eight pounds, and is easily made very fat. The color is white, and both sexes are hornless with bald face tinged with blue, and low carriage. Other breeds of long-wools in England have been greatly improved by crossing with this—the Lincolnshire, Romney Marsh, etc. In this country the Leicesters are large and coarse, but easily fattened and with good mutton, the wool moderately long, but stiff, and without gloss. Altogether this variety is not generally held in great esteem.

Third—The Lincolnshire is a large, bony animal, takes longer to mature, has a long, flat, bony head quite bare of wool, with a good fleece, rather thin, slightly kinky with some gloss. But although the Lincolnshires have been greatly improved in late years, their legs being shorter and the wool more glossy, yet the fleece not being equal in quantity or quality to that of some other breeds, they have not met with general favor, and are rarely adopted by our wool growers as a breed.

Fourth—The Southdown is one of the most popular breeds both in Europe and the United States, and have, by crossing, produced what are called Hampshiredowns, Shropshiredowns, Oxforddowns, and perhaps others, all larger and coarser, but retaining the Southdown marks and characteristics, all producing valuable wool and making good mutton. But the Southdowns must be regarded as at the head of all these, both for wool and table use, the crossing of this breed having added nothing to the originals in either quality. The Southdowns are exceedingly neat in form, both in head and body, with gray face and legs, forehead and legs well covered with wool, the fleece short, thick and soft, the outer surface often appearing as smooth as the nicely clipped. The body is straight, with well-sprung ribs, broad, level back, and deep flanks, all well covered with wool. This breed stands at the head of all the breeds of sheep for superior table qualities, but does not rank so high for quantity and quality of wool. The Southdowns derive their origin and name from the Chalkdowns of the south of England, but are not adapted to a cold climate.

Fifth—The most important and valuable of all breeds of sheep is the Cotswold or Gloucester, the wool of which has been held in great esteem since the fourteenth century, and has generally commanded a higher price than any other. In 1464 Edward IV. of England, sent a present of Cotswold rams to Henry of Castile, and in 1468 he sent a similar present to John of Aragon. So the Cotswolds reach back to a right honorable age and right royal patrons. But in modern times the Cotswolds have been greatly improved by crossing with the Leicester, producing a shorter wool and better mutton than in former times. The Cotswold of to-day has a long, straight body, well rounded ribs, flanking low down, good full twist, broad, flat back, full and low in brisket, a neat, stylish head, broad between the eyes, neatly tapering mouth, short legs, with head, jaws and legs covered with wool, and altogether a pretty and stylish body, covered with long, fine, wavy wool, which is glossy and very valuable and in great demand. The face in this breed is sometimes gray, but not generally so. They are more docile than any other breed, and take on flesh very kindly, making good mutton, but are not considered in this respect equal to the Southdowns. Yet, all things considered, the Cotswold is the best and most profitable breed for the wool growers of Kentucky, and we would earnestly advise them to continue to improve their flocks until they shall be as near thoroughbred as possible. It costs as little to raise and take care of a good animal as an indifferent one, while the thoroughbred will yield a fleece of from twelve to twenty-five pounds, worth twice as much per pound as the fleece of a common sheep, which would weigh three or four pounds.

Stock Breeder.

AGRICULTURAL FAIRS.

AGAIN the season of annual fairs approaches, and it seems a fit time to discuss the subject. Farmers, after the season of hard work in the harvest field, need some recreation, and generally attend the fairs, though they seldom have much to do in the management of them. If they did have more to do with their conduct it would undoubtedly be better for all concerned; there would be more of the useful and less of the sportive element brought to the front. The design of the city managers is to bring together a crowd and get the people to spend the most money possible. The *success* of a fair is counted by the amount of money that can be collected from the crowd that attends the fairs. The *economy* of the matter consists in spending the least money possible to obtain the most returns. It is a sharp piece of figuring to so arrange the premiums and purses as to give satisfaction, or at least, the least dissatisfaction, and draw the crowd to spend money.

Now, our notion may be old fogy in the opinion of a jockey sharp, but we think that if the farmers and industrial masses would take the thing into their own hands, and make the fairs successful in developing the utmost good, and instead of trying to get people to spend money in demoralizing horserace gambling, would encourage them in true economy, and in making efforts to improve in every industrial pursuit, it would be just as agreeable to visitors, and much more beneficial to the whole community. There is need enough of improvement and reform in fair management. We remember how fairs used to be conducted in New England, in the farmers' own interests, and would like to see the good old times copied from, if they cannot be improved upon. We wish we had no occasion to grumble, and will copy from an English paper what it says about the cattle show season:

The local cattle show, in its way, is an important institution, stimulating the breeders of the district to improve their stock, each in gentle rivalry trying to outvie his neighbor. It is at the cattle show, when his horse, cow, pig, or sheep stands alongside his brother-farmer's animals, that he finds out the failings and virtues of his own stock, and then goes homewards with a determination to go on improving its type and general character. Though, perhaps, beaten, he is not quite vanquished while he lives to fight another day.

To the healthy influence of competition at cattle shows, we must greatly attribute the present fine, improved character of our flocks and herds. In the exhibited animals the breeder sees what points to avoid or to cultivate. If he determines on making a mark himself, he does not fail to procure the blood of some winning strains. He cannot well do it without. Other laborers, however, have been in the field, and he enters upon their harvest. It would be folly to attempt to perfect an old unpedigreed strain of Short-horns, whilst the work is already to hand in a far advanced stage, from which the breeder may at once take his starting point without loss of time It is this consideration which puts a somewhat fictitious value, apparently, on the strains of cattle, horses, and sheep which have made special character and the power of transmitting their best qualities to their descendants. It is not the value of the individual animal as a food producer or as a breeder of ordinary stock for sale to the grazier or butcher, but its potentiality for good for generations to come that makes it a much coveted prize. The many years of skill and science also spent in developing the strain, the costly experience gained in the face of many difficulties, all go to render highly-bred animals valuable. Were it otherwise, fancy prices would be ridiculous. The cost of producing stock is necessarily included in their market price—following a common law of commerce. Thus prices that sometimes appear sensational are frequently but a natural result of time and treasure sunk in forming the special type, which, if broken, would take a generation to repair.

To all, and especially to the farmer, these exhibitions of stock and farm implements are educational. It is therefore satisfactory to find them ever increasing in popularity. The influence they exert on modern agriculture must be great. They are deserving of every support, and we trust the present show season will be as pleasant and successful as that of any previous year.

Buffalo Bones. A few years ago, none but the very tit-bits from the carcasses of these monarchs of the American plains were thought worthy of the hunter's notice, and after stripping them of their skins, these huge masses of wholesome flesh were left on the prairies to rot in the sun or to be devoured by the carnivorous beasts and birds that abound there. Now, however, owing to the wanton slaughter that has been carried on during late years, a herd of buffaloes is a most unusual sight in places where, within the memory of those who are still young, myriads of them passed and repassed on their route to pastures new at various times of the year. Now, also, according to the *Scientific American*, not only is the carcass itself utilized, but the bones form the source of a profitable business among the settlers in Kansas. The prairies, for forty miles each way from the railroad, have been gleaned over till not a relic of the chase can be found. Heads and ribs are worth $5 a ton; these are shipped to Philadelphia and ground up into fertilizers. Shins and shoulder-blades are worth $10 a ton; these go to the sugar refineries. The horns are worth $30; the tips are sawn off here, and sent to the factories of umbrellas, fans, pipes, etc. The remainder is used by the chemists. Bits of hide found hanging to the heads are taken off and sent to the glue factories. Every fragment of these animals is made to serve a purpose.—*Land and Water.*

Animal Parasites.—At a recent meeting of the Stowmarket (England) Farmers' Club, a paper upon animal parasites was read, from which we extract the following. Doubtless the greater part of our yearly losses of stock is caused by diseases which result from parasites, to say nothing of the danger of using the flesh of affected animals for food:

In carnivorous animals the tapeworms possess rows of hooks in the head, as well as suckers. In herbivorous animals, such as oxen and sheep, they possess suckers only. With this difference, which was simply an adaptation to different conditions under which food passed into the alimentary canal, the life history of all tapeworms is similar. The head is in reality an animal, for it is possessed of suckers or hooks, and has begun to bud into one of the well-known joints. The budding process takes place next to the head, so that each joint is thus pushed a step further along to the intestine. This continues until the whole of the intestines might become completely charged with those joints. The joints are connected by a kind of canal down each side. The interior of each joint is filled with a large branch ovary. When the joints are dead, the skin decomposes and the ovary is thus liberated. A tapeworm has often been known to extend to sixty feet in length, especially among those of the ox, and possessed more than 1,100 joints, and each one of these tapeworms developed many millions of eggs it was not surprising that the eggs were found almost everywhere, being blown about by the wind in this dried up condition they possess an amazing vitality, remaining uninjured perhaps for years. Should a pig, an omnivorous feeder, partake of food in which some of these eggs were contained, they would be conveyed into its stomach, where they would be converted into larvæ, and would after a short time bore their way through the pig's stomach and get into its muscles. There they would be quiescent, and assume a condition like the crysalis; this condition is called encysted. Pork killed in this condition is said to be measled, and should it be cooked without the larvæ being destroyed, and partaken of by man the encysted larvæ would then develop in man into the tapeworm. The tapeworm of dogs is of a very peculiar kind, and for a long time it was a matter of wonder how the creature got into the stomach of the dog. Now the secret is out. Sometimes when dogs affected by these worms went near sheep, the sheep also suffered from them. When in the stomach of the sheep they bored their

way through until they finally got into the brain, where they became encysted, and in this condition they caused the disease among sheep well known as the staggers. Man himself sometimes suffers from the encysted larvæ, which produces a disease called hydatids. Sheep were also affected by another parasite belonging to a different order from that of tapeworm, called flukes. These creatures possess a different internal organization, and attach themselves by means of suckers alone. Each worm was hermaphroditic and their presence produced the well known sheep rot. The eggs of the sheep fluke were blown about until they sometimes found their way into the water, where they swam about like microscopic organisms, and even become parasitic upon fresh water mollusca. It is undoubtedly because of sheep drinking the water in which the larvæ are present that they become affected by them. Lambs and sheep are also affected, especially the former, by round worms called *nematods*, especially by one form called *stongylus*, and the disease which the presence of this form gives rise to is called hoose or husk. It is generally to be met with in the bronchial tubes or throats of young lambs. It also gets into the interior of the heart or lungs, where it becomes encysted, and produces tubercular disease. When the *nematod* forms become encysted in man they produce a disease resembling rheumatic fever called *trichinosis*. When they are encysted in some animals, as in pigs, they are called *trichinæ*. In some instances these intestinal worms were not considered injurious; for instance, the Abyssinians never considered themselves healthy unless suffering from tapeworms. The dung of cows is frequently full of tape-like forms, although the cows do not seem to be suffering from any ailment. Some sheep are affected by parasites, yet nevertheless they yield prime mutton. It would seem from what is already known of the life history of these parasites that the danger arises from their excessive development.

Whistling Men are Kind to Animals. An old farmer once said to us that he would not have a hired man on his farm who did not habitually whistle. He always hired whistlers. Said he never knew a whistling laborer to find fault with his food, his bed, or complain of any little extra work he was asked to perform. Such a man was generally kind to children and to animals in his care. He would whistle a chilled lamb into warmth and life, and would bring in his hat full of eggs from the barn without breaking one of them. He found such a man more careful about closing gates, putting up bars, and seeing that the nuts on his plow were all properly tightened before he took it into the field. He never knew a whistling hired man to kick or beat a cow, or drive her on a run into the stable. He had noticed that the sheep he fed in the yard and shed gathered around him as he whistled, without fear. He never had employed a whistler who was not thoughtful and economical.

Colorado Stock Ranges.—Strangers make a great mistake when they look over the plains and call them unproductive and worthless, for what they think is barren is far from being so. If the pastures of the plains on which cattle are grown and made fat were represented by such meadows and cornfields as in the States are required for those cattle, the stranger would, like Timon, "see another sight," for they would stretch far and near and mile after mile in verdant green; and they would be the result of thousands and thousands of days' labor of men, and tens of millions of dollars of invested capital. But instead, all of this comes free; it is a wide domain of grass, owned by the government, which is possessed and utilized without the investment of a dollar or the expenditure of an hour's labor by man or beast, and it is presented not only through the spring, summer and fall months, but also through all the winter months; in fact there is not a day in the whole year in which cattle are not feeding on the the range. People in the States cannot understand this, for, as Burns says of the immortality of the soul, "it is almost too good news to be true." Still, such are the facts, and the amount of clear income to Colorado from this source is, to the whole people, greater than the income of any people in the States from the highest cultivation of the best soil. —*Greeley (Col.) Tribune.*

International Live Stock Exhibition.—The live stock show will be made in serial order, commencing with horses, Sept. 1st to 14th; dogs, Sept. 4th to 8th; neat cattle, Sept. 21st to Oct. 4th; sheep and swine, Oct. 10th to 18th; poultry, Oct. 27th to Nov. 6th. No charge will be made as entry fee, nor for the use of stalls, which will be of first-class character in all respects.

The stock yard is of sufficient area to allow the construction of 700 box stalls for horses, each fourteen feet square, these to be afterwards divided for cattle, by longitudinal partitions into 1,400 stalls, each 7x14, all of ample elevation and security.

The stock yard will be thoroughly well watered, and lighted by gas, and under the constant charge of a company of Centennial guards. Exhibitors, or their agents, will be required to assume the entire charge of horses, neat cattle, sheep and swine, and be alone responsible, although the Commission will do all in its power to provide for the comfort and safety of the animals. Hay and straw will be furnished by the Commission free of charge. Roots and grain will be sold at actual cost. Each breed of well established character in the various families of live stock will constitute a distinct class, under which awards will be made as provided for in classifications.

Holstein Cattle.—There is, perhaps, the least known about this breed of cattle of any in the country, and especially is this true of the West. The first we heard of them in this country were the importations by Dutch emigrants along the Hudson and its tributaries in the early settlement of New York. English stock writers give us precious little concerning this breed. The fact that the Holstein breed is capable of transmitting with undeviating certainty, constitutional characteristics to their progeny, is proof that they were bred with great care, perhaps more than a century ago; for it is well established that it is only by fixed, continuous, and systematic breeding for a great period that any breed obtains this power.

As a breed they excell as milkers. Invariably they are black and white in color and are reckoned among the best dairy breeds. A Mr. Le Roy, of New York, imported in 1823, some of these cattle, and they were afterward taken by his son to the Genesee valley in that State. They were remarkable for the yield and richness of their milk. But they in a few years crossed with the Shorthorns, by which the purity of the breed was lost. It was from this that the fine grades so much esteemed in parts of Orange county New York, sprang. There are at present in that section of the State, some of these Holstein grades, which scarcely have a superior for the butter dairy any where in this country.

The only pure bred Holsteins of which we have any knowledge in this country are the get of those imported by a Mr. Chenery, of Boston, Massachusetts, in 1861, and placed on a farm near that city. This importation was certified by official authority in Holland as being pure. A four year old bull 2,465 pounds, height five feet. The cows imported averaged each 1,325 pounds. One of the cows by test of six days' milk produced seventeen pounds fourteen ounces good butter. As a dairy breed, they equal any known. For beef, though heavy, they have not been tested long enough to determine their relative merits with other breeds.

Col. Wm. Cunback, of this State, we hear, is about to make a purchase of some Holstein cows, to give them a trial. We note this fact with pleasure, as we should like to see them introduced into the West, and tested for dairy purposes. We hope to have a description of these new-comers when they arrive, as well as a report of their qualities.—*Indiana Farmer.*

Beans can be used instead of corn for fattening cattle and sheep, and are so used in England to a very great extent. Chemical analysis makes them equal to oil-cake in fattening properties, and they are better than corn for growing animals —having greater proportion of nitrogenous, or flesh-producing properties. Morton's Cyclopedia gives the average product of an acre of good land, well tilled, at thirty bushels, of 66 pounds each—1,980 pounds in all. In this there are 460 pounds of nitrogenous, or flesh-forming substances; 1,168 pounds of heat (or fat) producing (970 pounds of this is starch), and 352 pounds water and mineral substances. Beans are always fed in the shape of meal, and are much used for horse feed as well as for cattle and sheep.

To Determine the Weight of Live Stock.—Measure in inches the girth around the breast, just behind the shoulder-blade, and the length of the back from the tail to the fore part of the shoulder-blade. Multiply the length by the girth (in inches), and divide by 144. If the girth is less than three feet, multiply the quotient by 11; if between three feet and five feet, multiply by 7; if between five and seven feet, multiply by 23; if between seven and nine feet, multiply by 34. If the animal is lean deduct one-twentieth from the result. Another rule is, take the girth and length in feet and multiply the product by 336, and the result will be the answer in pounds. The live weight multiplied by 605 gives a near approximation to the weight.

The Farmers Loaning Wheat.

The wheat buyers of California are a clever set of fellows, and withal shrewd business men. We have heretofore shown up the combination that exists among them, constituting one of the most formidable business rings in the State. Formidable, because possessed of immense capital to operate with, and controlled and managed by men of great experience in the business, and holding within its control all the machinery and mediums of correct and latest market news. This ring or combination has practically held the monopoly of the wheat exporting business for this coast since wheat has become an article of extensive production for export. It also, to a great extent, has the control of the carrying trade in wheat from this coast to Europe and all other parts of the world. With all this experience, and all this capital, and all these facilities, the ring can fix the price of wheat almost at will, and can regulate the profits of the farmers almost to a dot. It is true the farmers have at times made some efforts to get out from under the hand of this ring, but have always failed, and after each effort have found themselves more completely hedged in and bound down than before. As a natural consequence, at each successive failure of these efforts the grain buyers have become more conscious of their strength, and have exercised their power with more boldness and audacity. The manner in which they are managing the wheat market this year is an evidence of their conscious strength, and of their disposition to use it to their own advantage. Possessed of unbounded means themselves, they have invented a plan by which they can do business without the use of these means. They are now operating on the capital of the farmers—the wheat raisers of the country. They are loading ships with wheat and dispatching them for the European markets without having a dollar of their own money invested in that wheat, and by this same operation are completely destroying all demand for wheat for export at any price. And the strangest part of this transaction is, that they have got the farmers to become parties to and promoters of the whole scheme, notwithstanding it is all done at their expense and to their great disadvantage. The operation is this: The grain buyers, through their agencies, which are located in all the wheat growing sections of the State, ascertain as nearly as may be the amount of wheat to be exported. They then get control of the necessary shipping to carry this wheat to market. They then fix upon a price for wheat alongside the vessels, which, of course, is low as compared to the European market price. This price they cause to be quoted in all the commercial papers of the Bay City, and the same is copied into all the local papers of the State. In connection with this quotation, however, they manage to have it stated in all cases that there is little or no demand. They then instruct their agents throughout the country to keep and represent wheat as dull and not wanted at any price—that is, they are not wanting to buy. For the accommodation of farmers, however, who have not the means of storing all their wheat, they will take all the wheat that may be offered—that is, they will borrow it of the farmers, and will agree that within a certain stipulated time they will, on demand, return an equal amount of wheat or will pay for the same then market price, at the option of the loaner, the farmer. Thus the wheat buyers, all of whom are combined and interested in the operation, are managing to get possession of large quantities of wheat without the investment of a dollar of their own money, and with it to fill their orders and supply the European demand, while the farmers in their ignorance and innocence work on and wait for wheat to rise so they may demand a return of their loaned wheat or its equivalent in gold. And so they may work and wait in vain, for what is there to produce a rise in wheat under the circumstances? The real demand for export has been supplied, and the ring of wheat buyers, with the money in their pockets, are masters of the situation. They don't want to buy wheat, and there are no other buyers. They already have the farmers' wheat, and the money for it, and of course wheat will remain dull and the prices rule low. The wheat ring will not be in any hurry to part with the

money they have obtained in this way, nor will they be anxious to put up the price of wheat, but the time will come when the farmers will be under the necessity of realizing something for their crop to pay expenses and debts, and just about that time wheat will be mysteriously very dull and low, and then the ring will profess to have plenty of wheat and will be anxious to return all they borrowed. As a compromise, however, and to get out of the scrape they have got into, they will give the farmers the money at present rates, and just to accommodate them, though they do this at a sacrifice.—*Record-Union.*

The Dairy.

Song.

BY CHAS. KINGSLEY.

"O Mary, go and call the cattle home,
And call the cattle home,
Across the sands o' Dee!"
The western wind was wild and dark with foam,
And all alone went she.

The creeping tide came up along the sand,
And o'er and o'er the sand,
And round and round the sand,
As far as eye could see;
The blinding mist came down and hid the land;
And never home came she.

"Oh! is it weed, or fish, or floating hair—
A tress of golden hair,
O'drowned maiden's hair,
Above the nets at sea?
Was never salmon yet that shone so fair,
Among the stakes on Dee."

They rowed her in across the rolling foam,
The cruel, crawling foam,
The cruel, hungry foam,
To her grave beside the sea;
But still the boatmen hear her call the cattle
Across the sands o' Dee. [home

Plain Words About Milking.

A FRIEND of ours recently purchased a tub of butter for family use which turned out to be so tainted with the filth of the cow barn as to be entirely unfit for the table and could not be used for culinary purposes. This butter was of good color and texture, and was so well made as to have commanded the highest price in market had the flavor been perfect.

A merchant recently showed us a few cheeses which he had purchased to supply customers who desired something choice. The cheese was well made, very rich it fat, but it had a well-marked taste of the cow stable, and customers who had taken one piece wanted no more, as it was unfit for the table. These are by no means exceptional cases. Our attention has been called to like cases over a wide extent of country in the dairy districts, and we are quite certain that large amounts of both butter and cheese are injured from this cause alone, and which would otherwise take the place of a first-class article.

At the late meeting of the American Dairymen's Association, Mr. Robert McAdam, a well-known factoryman and cheese expert, gave an account of the various kinds of filth which he had found in the factory strainer after receiving milk from his patrons. And yet some people wonder why progress is so slow in improving the flavor and character of our dairy products. At this time, when prices have depreciated and are unsatisfactory, it behooves dairy men to make every effort possible for improving the flavor and quality of their goods. The responsibility must not be shifted wholly upon the manufacturer. In most cases it lies back of this, and rests with the dairyman in the management at the farm.

The defect to which we have alluded comes from uncleanliness in milking; and especialy is this the case during spring and fall, when the cows are more or less confined to the stable. Some dairymen, even if they do not themselves milk upon their hands and wet the teats of the cow before commencing to draw the milk, they allow those in their employ to do so, and the result is, more or less filth drops in the pail to taint its contents. It is a very nasty practice, and should be guarded against in the most rigid manner.

If a cows bag is besmeared with dung and dirt, it should be washed with water and wiped with a cloth, and then the operation of milking should be done with dry hands. A person who has once adopted the practice of milking with dry hands finds the milk can be drawn quite as easily and rapidly as by constantly wetting the hands; while the latter practice must always result in more or less filth falling into the milk to give it a taint of the stable and thus injure the product which is manufactured from it.

This story of cleanliness has been very often urged in connection with other advice on the dairy; but it needs to be urged much oftener before it will be properly heeded. One great fault complained of in American cheese is its defective flavor, and there can be no doubt that if taints could be traced directly to the cause, they would often be found to come from the source we have named. If taints are so distinct and pronounced as to leave no doubt as to their origin in stable filth, there cannot be much doubt but that there must be various gradations of this taint affecting the flavor of cheese according as the milkers have been more or less clean in their milking.

This question was never more important than now. The low price of dairy products requires more attention to the details of handling milk at the farm, higher skill in manufacturing and curing our dairy products, so that we may put a better article before consumers at home and abroad and thus make up the loss so far as possible caused by depreciation of prices.—*Rural New Yorker.*

Sour Milk Cheese.—An apparently rich, meaty cheese was exhibited at the last meeting of the American Dairymen's Association, by J. M. Jocelyn, of Cattaraugus county, made of sour milk and buttermilk. Much inquiry has been made as to the process by which this cheese was made, and some blame has been thrown on Mr. Jocelyn, for making a "full skim" cheese in such a manner that consumers might be led to suppose that they were eating full milk cheese. In answer, Mr. Jocelyn writes to the Utica *Herald* as follows:

I have formed a theory that the office of the fat of the cheese is no benefit to it as an article of food, except to keep it soft and meaty, and really the caseine is all that is valuable as food. Now, if a cheese can be made with still less grease and a correspondingly larger amount of caseine, the producer and consumer will be greatly benefited thereby, as nearly all the cream can be used for butter, and the cheese can be sold for a lower price, and be more valuable to the consumer than the cheese he now pays more money for, that is, full cream cheese. After various experiments I adopted this theory and carried it into successful operation. I set the milk long enough for the cream to sour before skimming, thus making more and better butter; then churn and mixed this sour buttermilk with the sour skim milk, and the acid has destroyed the fibre in the milk so it will make a tender cheese. Now, if I proceed in the old way I will have a mess of Dutch cheese; but instead, I heat up rapidly, and when at the proper temperature, I add alkalies sufficient to neutralize the acid and saponify the remaining grease in the milk, so that I have a smooth curd, a clear, green whey, and as my curd goes into the hoops it is no more sour than one that is made from sweet milk. The secret of this cheese remaining so soft and being so durable, is owing to the saponification of the fat, it being thus evening distributed among the minutest particles of the cheese, and being saponified, it never can become rancid; and as I have said repeatedly, this is the most durable and wholesome, and, to my taste, the most delicious cheese that can be made.

Profitable Cows.—It is far from economical to keep poor stock of any kind, poor cows especially. In a dairy herd, some cows will far more than pay for their cost of keeping, while others not only fall far short of this, but entail an actual loss from year to year, and this will often go on indefinitely because no accurate measure and weight of product is kept, and their relative value is not ascertained. In a cheese dairy, for instance some of the best cows will yield seven hundred pounds of cheese a year, while others in the same herd will not yield over two hundred pounds. But in how many cases will this deficiency be found out and remedied? In a butter dairy the loss from poor stock will often be even more marked. Some cows give milk which is rich in butter while that of others is very poor. Both milks are put together and the poor quality of one is not found out perhaps, for many months. The same food is given to one cow that is given to the other, and the cost is about the same, but if the real facts were known it would appear that all the profit came from the one cow, while the other was entailing a constant loss. We ought to be more careful in this respect and select our stock with greater reference to quality. A careful examination in this direction would discover some of the worst kind of leaks.

Again, cows are often kept beyond their prime, when they are no longer very serviceable, and should have been culled out of the herd and sent to the butcher or got rid of in some other way. —*Mass. Plowman.*

That's the Way.—"We knows the public is down on us," remarked the old milkman, as he dipped out the desired quart from one of his big cans, "but the public is mistaken. In the first place we put in a little water—only a bit, to make up for shrinkage. It goes to the big dealers, and they ain't a bit keerful when they gits to pouring in water. They sells it to the grocers, and they put in chalk with one hand and water with the other, and they are thinking of politics, and get in too much. The servant girl goes after milk for the family, drinks a third of it, and she puts in water to make up the measure; and, you see, when the family gets it, the taste ain't there, the look ain't there, and they goes for us poor men who hasn't a dishonest hair in our heads. That's the way, mister. Gee up there, Homer."

In all my observation, the man who gives full feed with care, gets the best pay for what he does feed. I am fully satisfied half feed does not pay, and irregular feeding does not pay. If you want your cow to give a good mess, and that steadily, give her something to make it of. If you economize and cut down the cow's rations, she will as surely cut down your supply of milk.—*Ex.*

A Cheap Milk House.—I will give the description of a cheap milk house—such as any one can have if they will. Grandfather's is of hewn logs; the foundation of stone, one foot below the ground surface and six inches above, laid in lime and sand. The building is ten by twelve feet, one story high, chinked, and after standing one or two years to settle, was plastered inside and out with lime and sand. The roof, of shingles, extends some four feet over the door; banked a few inches all round to keep dry. Ground floor of nice, clean gravel, got at the creek. A floor is laid overhead of plank, to assist in equilizing the temperature. The receptacle for crocks is a trough made of two-inch plank, water-tight reaching full length of the building from outside to outside. The water enters from a lead trough four feet long, at left of the door, and goes out at the other end; after running some fifteen feet, it enters a large trough, where the work horses and cows always slake their thirst in summer. The water at no time is more than four inches deep. It is needless to say that in the warmest weather in summer they have cool milk and good butter.—*Cor. Cin. Enquirer.*

Rules for Milking.—The following rules are issued from a New York cheese factory for the use of its patrons, and are worthy of a wider dissemination:

1. Milch cows should have free access, at all times, to good running water.

2. They should never be heated, by being run, stoned or dogged.

3. The utmost cleanliness should be observen in milking, and by no means wet the hands in the milk while milking.

4. No can of milk should stand where it will absorb the barnyard or stable odor, or any other scent.

5. The milk should be strained and well aired immediately after having been drawn from the cows.

6. Some arrangement for effectually cooling is at all times very desirable, and when the milk is kept at home over night, is indispensable.

7. Scalding all vessels used about milk at least once a day with boiling water, and rinsing with cold water at night, is essential.

Cheese Poisoning.—The Lewiston (Ill.) *Union* reports the poisoning of ten individuals, residents of Ipava, by cheese. None of them died, but three or four were saved with difficulty. The physicians, so the *Union* says, pronounced the misterious attacks "the milk disease," it being supposed that the cows from whose milk the cheese was made, were afflicted with that malady.

[One prime cause of milk disease is the stagnant water that cows are often compelled to drink. In no one thing should dairymen be more particular than in providing an abundance of pure, clean, fresh water for their cows to drink. Stagnant water contains the germs of disease, and many malignant fevers and deaths, particularly of children, have been traced to the drinking of stagnant water, or water containing poisonous germs, by milch cows.]

"Be Kind to Your Cow."—A farmer living just out of Vicksburg was reading in an agricultural paper, the other day, an article headed "Be Kind to Your cow." He went out to milk with a heart full of kindness, and as he sat down he whispered: "So, boss—stand around—good creature—hist a little—there, you intelligent and kind-hearted old bossy." About two minutes after that his wife heard him whooping and yelling, and as she ran to the door he called out: "Bring me the ax, Maria, and the spade, and

that big club there, and the butcher-knife and that shot-gun; for I'll be darned if this old hellion shall ever live to kick me in the jaws agin!"—*Vicksburg Herald.*

Porcine.

How to Breed Pigs.

AGE OF PARENTS.

OTHER things being equal, those obtained from parents two to five years old are generally the largest and most vigorous and from such I prefer to select for breeding.

TIME OF BIRTH.

If the climate where bred will safely admit of it, pigs ought to be dropped as early as March or April. By coming thus early, those destined for fattening, if continuously fed well, will be large enough for slaughter the following December or January, which is usually the best time for marketing. If born much later, it may be necessary to winter them over for another year, which lessens the profits of rearing considerably. Those reserved for kee ing up the stock, coming thus early, will get so good a growth at one year as to breed then, advantageously.

FEEDING.

Do this for the first few weeks after weaning, five or six times per day. This keeps them from an empty stomach or overgorging, both alike pernicious. See that they eat up their food each time before being again fed. After attaining three months age, they need not be fed oftener than three times a day, but this should be regularly done morning, noon and night.

KINDS OF FOOD.

The best food I have found for pigs for a few weeks after weaning, is as much cow's milk or whey as they will drink. Into this stir more or less, as required, of finely ground provender slightly salted, composed of six parts of oats, two of corn and one of flax seed. If the latter is not at hand, substitute oil or cotton seed meal. If milk or whey are not to had, use pure, fresh water. If all could be cooked so much the better.

When more convenient or economical, other food may be substituted for the above, such as pea, bran or barley meal, and unbolted wheat, rye or buckwheat flour. Shorts and bran I have found are apt to scour them at this age, especially if uncooked. The same remark will apply to vegetables, apples and other fruit, which if fed at all, should be first steamed or boiled, and then mixed with meal. Brewers' grains and malt combs are recommended, but never having tried them for very young pigs, I cannot speak of their suitableness from my own experience. They are good for older animals.

Other kinds of food assist in producing a rapid growth of the pig, as offal from hotel tables, fisheries, slaughter-houses, etc., but as few can avail themselves of these, I speak more particularly of such as is produced on the farm. Being an omnivorous animal, it does not matter so much as to the kind of food given, except when put up for fattening—then it must be grain or meal of some sort entirely—provided it keeps the pig in a healthy, thriving condition. Care must be had during growth to never stuff nor scrimp, both being alike injurious.

TRETMENT OF PIGS DESIGNED FOR BREEDING.

In warm weather, let them run in a grass pasture, if to be had, with pure running water and plenty of shade. In cold or stormy weather, provide yards with a dry soil and southern exposure, with comfortable pens or sheds, well littered, under which they can retire at will. Cold night air is pernicious to young pigs, and is liable to give them swollen throats, which sometimes proves fatal. Those of nearly the same age should be kept together, and not so many as to endanger any being overlaid and smothered. When kept in pens or yards, supply them with chunks of decayed wood, charcoal, etc.

PURGING OR SCOURING.

Young pigs are apt to scour when fed on too loose food. The best remedy I found for this, was to shut them up in a covered pen, with a plank floor, and feed entirely with well dried oats or corn. Some times I gave, in addition, a little boiled flax seed or oil meal mixed with their drink.

TREATMENT OF PIGS SELECTED FOR FATTENING.

Careful experiments have proved that time is economized and that pork can be be most cheaply produced, by pushing pigs forward as rapidly as possible, from the time of their birth to that of their slaughter, giving them regularly, at least thrice per day, all the most suitable food for this purpose which they will eat up clean and digest. The last three weeks or so, finish off with Indian meal pudding, or whole corn, with pure, fresh water to drink. Old corn, or well ripened and dry of the season's growth, is best. This makes the sweetest and most solid pork of anything I have tried. Some contend that roots and pumpkins have so great a proportion of water in them, that if fed with the whole corn or meal, they tend to an increased appetite, keep the bowels in better order, and lessen the quantity of water a fattening animal would otherwise drink. They add also, that this combined feed lessens the cost of fattening, and makes as sweet and solid meat as corn alone. I cannot vouch for this method, never having followed it; but if I did, I should use the sugar beet in preference to other roots, and the winter squash in preference to pumpkins for I think they are best fitted for this purpose.—*From Allen's Price Essay.*

The Horse.

BEST BREED OF HORSES.

THERE are many and diverse opinions as to what sort of horses are most profitable to raise. The leading breeds on this Coast are fast horses, such as sporting men like. Probably the horse-racing element at our agricultural fairs, which has controlled and overshadowed everything else, has had a good deal of influence over breeders. It requires fine bone and muscle and toughness of cords and nerves to excel in speed, and it is agreed that the "wind and bottom" cultivated in these horses are just the qualities most valued in horses for all purposes.

But there is certainly something more needed than most fast horses possess, even admitting that these valuable points of the fast horse are essential. A profitable horse for all purposes must have size and weight. These are very essential when it comes to doing any kind of teaming or hauling. While he should not be so heavy as to be awkward and cumbersome upon the road, he does need enough weight and strength to easily move along with a loaded wagon over a good road. Fast horses are too nervous for general usefulness; too high-strung, impatient, impulsive, unreliable and untrustworthy. The horse for all work must be so well balanced as to be tractable, gentle, quiet and obedient under all circumstances; not inclined to jerk things and fret under restraint and a load. There is altogether too much of the fast horse mixed with the blood of our common horses in California. We have too many cheap and useless horses—horses that are neither fit for the farm, the road, nor the turf. They can be found in great plenty; are generally held at figures that few care to pay on account of their "good blood;" are kept more for ornament than use year after year, because nobody wants to buy them. No wonder that many farmers declare that there is more expense and less profit in raising horses than any other thing on the farm.

Now we know of but one remedy, and that is to discard the race horse and breed from the best breeds of work stock. Never mind what the jockeys say. Their interest all lies in one direction, and their wisdom is too one-sided. Look around you and pick out the teams that are, on an average, worth the most money, and are the most in demand, and are most needed. You will find them horses weighing from 1,100 to 1,500. Say the standard will be 1,150 to 1,250 pounds each. Such horses will sell readily every fall for $400 to $600 per span, for farm work, when lighter horses will be left on your hands to "eat their heads off."

The sensible farmer should study his own interests in this matter as in every other, and not breed to suit the fancy of jockeys and stud-horse owners.

Experience has proved that valuable colts can often be got from common light mares by breeding to the heavy work stock, either English or Scotch breeds. The same mare bred to fast stock will bring cheap colts of little use or value for anything. The farmers in every township should club together and get a good heavy stud, and try to raise up a stock of horses that *will pay* in money and in useful returns—horses that can work on the farm, haul your produce to market, or take you to town in good shape before a light wagon. Let the fast men breed their fast stock. Choose the best.

INTRODUCTION OF THOROUGHBREDS IN CALIFORNIA.—A writer in San Mateo, California, to the *National Live Stock Journal*, states the following:

In the early days, and for about five years after the American possession of this country, the horses consisted of the Spanish mustang, reinforced by the few American horses and mares brought across the plains by immigrants; and these were a few of all sorts, among them some well-bred and even thoroughbred mares from Kentucky and the West. I have certainly seen many that looked it, although the pedigrees given often sounded rather "miscellaneous." Till 1853 or 1854, nobody thought of improving the breed of horses, and the first person I heard of attempting to do so was William Hood, of Los Guilacos, Sonoma county, then, as now, a rich land proprietor, at whose place I happened to be in January, 1854, when he showed me a two-year-old colt which he had purchased in Yorkshire, and which had just arrived here. This was the thoroughbred imported Lawyer, of whom more anon. About this time, or soon after, appeared upon the scene the brothers Williamson, bringing with them the well-known and highly-esteemed Belmont (grandsire of Thad Stevens), and several thoroughbred mares, which at once established these gentlemen as the founders of thoroughbred-horse breeding in California. After another interval of time, Mr Combs brought across Billy Cheatham and Ashland, thoroughbred stallions; but I rather think he had not any thoroughbred mares, calculating, like Mr. Hood, to breed from such well-bred mares as were here. There were also several trotting stallions of more or less repute, among which I may mention old General Taylor and Black Hawk David Hill, and a horse called Rattler, and a big English horse known as Peacock, who was brought from Sidney, Australia, and worked in San Francisco as a dray horse, and afterwards made a couple of seasons, and got many very excellent generally-useful horses.

NAILING ON THE SHOE.—No shoe should ever be nailed to the foot until it has been ascertained that the pressure of the hands is sufficient to keep it steadily in its place, and preclude any appearance of daylight between it and the foot. A motion prevails in many places that the shoe gives the particular form to the foot. This is a mistake, for no foot can possibly be affected by any form of the shoe it may stand upon. It is the situation of the nails which alters the form of the foot, by preventing its expansion, and such prevention of expansion is the cause of much of the lameness affecting the foot. In putting on the shoe the nails should be driven with a gentle hand, and they ought not, by any means, to be clinched very tight. Hard driving and tight clinching will bend the hoof at the place where the clinches are turned, inwards and downwards towards the shoe, in such a manner as to injure the tender parts contained within the cavity of the foot. Besides, it is not necessary for a man to forget he is working with the foot of a living animal. The shoe will remain on a sufficient length of time with gentle driving and clinching, provided it is properly fitted to the foot. If it has a thoroughly even bearing there will be little stress on the nails. Coarse nails often split the hoof, and thus keep it continually broken. A fine nail will answer all the purposes required, if it is made of the right material. The clinches should not be rasped away too fine, nor should the covering of the hoof be allowed to be rasped away (as nearly every smith seems to delight in doing); it destroys the covering provided by nature as a protection against the too rapid evaporation of the moisture of the hoof, and causes the horn to become too dry and brittle.

In connection with the application of the shoe, we know of no worse fashion than the one which the smith has of forcibly taking hold with the thong and hammering the shoe to the one side or the other, after three or four nails have been driven, for the purpose of putting it straight on the foot. This is a speedy method of making up for his want of accuracy in placing it at first; but it should never be practiced. It strains all the nails which have already been driven, and is calculated to do serious damage to the foot.

THE agriculturist is taught to look upon this lovely earth of ours as the beautiful landscape of God's creation which is imbued with the powers of life, to breathe and feed, and to yield its elements and products to the nursing and delicate operations of his hands. While he follows the plow he perceives its use; he sees in it how the educated mind of man has infused mechanical science into

its structure. He marks well the work it has to do, and how well it is adapted to the work. He now contemplates the seeds he commits to the earth, and does not believe that it is the work of chance that they grow. He sees, too, that they are inspired with the germinating powers of life and light. He perceives that they are distinguished by the qualities of good and bad, and knows that perfect analogy which characterizes life in its inception, growth in progress, the product of their results, and the final death of all vegetatable as well as animal creation. But, above all, and more than all, he has learned to know himself; that he is a part of this special work of God's hands, placed here to direct and govern all these things.

Cleopatra, Queen of Beauty.

ONE of the most remarkable women in all the ages was Cleopatra, queen of Egypt. Brought up in the luxurious court of her royal father, Ptolemy Auletes; taught in all the wisdom of the Egyptians, and combining in her person a wonderful beauty and grace of manner, she was enabled by the skilful use of all her powers to bring even Imperial Rome to her feet. Kings and Emperors stood spell-bound before her matchless charms, and forsaking home and country willingly became her slaves. During all her eventful life she was no less queen of hearts than queen of Egypt, and the mark she made on the world's history was so great that it has lived for nineteen hundred years, and doubtless will to the end of time.

Historians describe her as small in stature and perfect in form. Her voice possessed a silvery sweetness, and her face an indescribable beauty which captivated all who saw it. She was also a woman of great firmness of character, much personal courage and wonderful executive ability. At the same time she had traits, which, when called out, made her selfish, designing and cruel.

Her first important conquest in hearts was none other than the great Julius Cæsar. He was so infatuated that he deserted his wife and family, neglected his empire, and gave himself up wholly to her. He lost his throne and life in consequence, and a bloody civil war followed which raised to prominence the great warrior, orator and statesman, Mark Antony. Desiring to make a public example of her for leading to destruction the Imperial Cæsar, he sent a messenger to Egypt and summoned her to meet him at Rome.

Cleopatra was now twenty-eight years old and in the hight of her charms. She at once set about making preparations for the voyage. Egypt was the home of luxury and splendor, and all its resources were employed in fitting out the royal train. Gold and silver, rich services of plate, ornaments of precious stones and gold were stored in her ships, and the fleet sped away over the blue waters of the Mediterranean, the most splendid sight the world ever saw. When it reached the mouth of the river Cydnus it stopped, and here the royal barge, adorned with carvings and decorations and glittering with gold, was launched, on which the queen now embarked. The sails were of purple, and the oars inlaid and tipped with silver. Upon the deck, under a stately canopy made of cloth of gold, Cleopatra reclined, gorgeously attired. Around her were a company of beautiful boys and girls representing cupids, nymphs and graces, who fanned her with their wings. Singing birds and flowers added to the attractiveness of the scene, while bands of musicians played soft airs, and kept time to the stroke of the silver oars with the most ravishing music. Thus, preceding her fleet, she sailed up the stream to meet and to conquer the conqueror of Rome.

Antony was then at Tarsus, but the whole city deserted him and hastened to the river bank to behold the remarkable pageant. She landed, spread her tents, prepared a sumptuous banquet and with womanly tact sent an invitation to the sturdy Roman to be her guest.

Moved by curiosity, he accepted and went, and from that hour became her abject slave. Like Cæsar, he left his throne and family to cast his fortune with hers. Whole days and nights of revelry were spent with her on the banks of the Cydnus, until he became so enamored that he left Rome and followed her to Alexandria in Egypt, where for years he resided. Here the wily queen devoted herself to him incessantly, filling up every moment of his time with some new form of pleasure, in order that he might not think of his absent wife and children, and of his empire on the verge of ruin.

His continued absence from Rome led to war. A rival, Octavius, appeared. The great naval battle of Actium was fought and Antony was defeated. He fled to Alexandria where he was pursued by his enemy. The city was besieged and finally taken, and amid the horrors of the scene, word was brought to him that Cleopatra had taken her life. This was the crowning calamity, and he immediately made preparations for his own death. When ready, he endeavored to have his attendant, Eros, kill him with his sword, but he refused. He then took it from the servant's hands, plunged it into his body, and staggering to a bed that was near, fell over it in a swoon. Recovering shortly after, he was told that Cleopatra was still living and desired to see him. Antony begged to be carried to her that he might die in her presence. She was in the palace, and the dying Roman was borne through the terror-stricken city and raised by means of ropes to the chamber of the queen. He was carried to a couch and laid upon it, while Cleopatra wrung her hands and tore her hair in the greatest anguish. She clung to her dying lover and bathed his blood-stained face with her tears, uttering the most piteous exclamations of grief. But groans and tears could not avail, and he died in her arms.

She now gave herself up to the wildest despair. Octavius, desiring to publicly exhibit her in his triumphal train at Rome, endeavored to so guard her that she could not take her life, but she managed to have brought to her in a basket of figs a poisonous insect known as the asp, and applying this to her arm, died, defying her conqueror.

Thus ended the career of this matchless beauty, whose wonderful life and tragic death have formed a subject upon which poets, painters and sculptors have exhausted their efforts during all the ages since. Had she lived in our day, her life and influence might have blessed instead of blighting the world. Says Abbott, the historian of her: "The events of her history, the peculiar character of her adventures, her sufferings and her sins, were determined by the circumstances by which she was surrounded, and the influences which were brought to bear upon her in the soft and voluptuous clime where the scenes of her early life were laid.

WHETHER admitting women to "membership and position in the Grange," is all that is necessary to inculcate "a proper appreciation of their abilities and sphere" depends somewhat on what is a proper appreciation. For our own part, we do not think that permitting one's wife to do all the drudgery of the house, to have no leisure time for reading, tending flowers and visiting, shows a proper appreciation of those matters. Nor do we think that sending the sons to college and giving the daughters only such education as is to be had at the district schools, gives evidence of it. We are inclined to doubt whether a strong man who allows his little wife to carry the baby at the county fair—we have neither the space nor the inclination for any discussion of the much mooted question whether babies should ever be taken to fairs—really possess it. Finally, we sometimes think that the men who insist on paying a competent female teacher a smaller salary than they pay an incompetent male teacher are not imbued with it. Holding these particular views, it may not seem surprising that we should think something more than admission to the Grange necessary to inculcate a proper appreciation of woman's abilities and sphere.—*Grange Bulletin.*

WOMAN'S influence depends largely upon her power of charming. A frowsy woman may possibly be morally very excellent, but her influence will be far less than that of a fascinating, sinful sister. It is time that women understood that beauty, grace, culture and every feminine attraction may be made powerful for good. The representative French woman cultivates and preserves her charms to pander to a personal vanity that longs for continued admiration and adorers. The American woman of the *demi monde* pursues the same course regarding outward charms. But it is left to a few noble, appreciative, lovely women to grow old beautifully and gracefully; to make for themselves places in the hearts and esteem of men and entrench themselves in the stronghold of their purest love so firmly that no rival can dethrone them. Their sons are their ardent lovers. Aged men retain for them all the admiration, respect and gallantry of their youth; and the young men reverence them and hope their own young loves may live to be as lovely as they.

"Hue to the line, let the dispose," etc.

Hygienic.

Toothache.

Gracious! Godfrey! how it pains me!
Lordy! don't that old tooth jump!
Seems as though ten thousand devils
Pried with crowbars round its stump.

Whew! can't some one give me something
Just to stop this blasted pain—
Hot-drops, laudanum, cloves or hop-bag?
Quick! or I shall be insane!

Stop that 'tarnal baby's squalling!
Jethrew! don't my tooth ache sweet!
Darn that cat! I'd like to kill it!
Always under some one's feet.

Jove! I'd like to fight with some one,
Just to get my jaw stove in—
Fire! murder! Godfrey! Gunther!
Oh! it's aching now like sin!

Howling, am I? Well, I know it!
And I guess that you'd howl, too,
If you had a blasted toothache—
Same as this one—troubling you!

Curse, I know it don't relieve me;
But I'm crazy with the pain!
Ain't there anything to ease it?
Let me try the hops again.

There, now, gently—place them easy!
Phew! they're hot! Just let 'em cool!
W-ll, put 'em on. You're bound to burn me!
There, you've done it! Darn a fool!

CARE OF THE TEETH---MODERN DENTISRY.

BY A. O. HOOKER.

IMPORTANCE OF FILLING.

IT has been estimated that twenty millions of teeth are lost from the mouths of our population of the United States annually, all or nearly all of which might be preserved from pain and decay until old age, by timely and judicious filling with gold and other approved materials. The old and oft-repeated adage, "an ounce of prevention is better than a pound of cure," is nowhere more applicable than to dentistry. If teeth were properly filled in the early stages of decay, the operation would be attended with much less pain and fatigue and the dire dread which many people now have of the dental chair would not be known. Procrastination is the silent thief that gnaws away at these valuable organs until they are past all remedy, and they are offered a sacrifice upon the altar of common neglect, to be replaced by an artificial substitute which at best is but a poor apology for the natural teeth.

Within the past few years there have been produced a multitude of new and useful improvements, all tending to quicken the process and mitigate the pain of dental operations, not the least of which is the

DENTAL ENGINE.

This is used for a great variety of work, such as filing polishing, separating and cleaning the teeth, but more especially for preparing cavities for the reception of gold and for finishing the same after the tooth is filled. It does this in a very efficient and beautiful manner. A few moments' of experience with the engine is sufficient to convince almost any one that it is far superior to any and all instruments previously used for such purposes.

Another very valuable acquisition to the long line of improvements, which might be mentioned as comparatively recent, is the

RUBBER DAM.

This takes the place of a mouth full of napkins, muslin, bibulous paper, sponges and a variety of other articles for keeping a tooth free from moist-

ure while filling, at the same time it gives the patient perfect ease and freedom.

But notwithstanding the many improvements and the efforts made to lessen the severity of the dental chair, there are a few who approach it with a faltering step and a feeling akin to that of a martyr of olden times, when live nerves were plucked from their bony cells with ruthless hand. Unfortunately those few approach the chair so seldom that their teeth are irretrievably lost. This brings us to the subject of

ARTIFICIAL TEETH,

and while this branch of the profession has been making rapid strides, there seems to be one feature which has been partially overlooked. This is in the failure to restore the natural expression of the face by the replacement of lost teeth. The great law of adaptation in reference to which Nature plans all her work, is nowhere more manifest than in her production of human teeth—always beautiful, unless deformed. And when it becomes necessary, through neglect or other causes, to have these natural organs remove, the inventive skill of man comes into requisition to furnish a substitute which may not only be useful, but shall recognize this unerring law of harmony. So perfectly has this difficult task been performed by the ingenious and untiring manufacturers of artificial teeth, that the dentist has no excuse, through lack of study or perception, to cause such glaring deformities as are often perpetrated. It is evident that the majority of those engaged in this branch of the profession have given more time and study to the best methods of securing comfort, usefulness and durability to artificial dentures than to the equally important question of fitness and harmony with the general physical characteristics of the patient. To this account may be justly charged the unsightly appearance of mouths whose lost teeth have been replaced in disregard of this universal law. It matters not how well adapted for speech and mastication an artificial denture may be, if it bear not the relation demanded by age, temperament, peculiar mould of face, etc., it cannot fail to give that artificial appearance which attracts the attention of every beholder. And yet how often of this sad lack of taste staring at us from mouths where every sense of aesthetic beauty and harmony is violated—teeth of a Russian in the mouth of a Frenchman, those of a New Englander given to a South Carolinian, or those of a Canadian to a Cuban; the lips of age disclosing the teeth of youth, and no distinction made between a male and a female denture.

San Jose, August, 1876.

KEEP FOOD IN A CLEAN PLACE.

Ed. Agriculturist: I inclose an extract from No. 1675 of Littell's *Living Age*, showing the absorptive power of milk, which fact may be new to many of your readers, and I think that this curious power in milk may be the unsuspected source of ill health in many families who are compelled to keep their daily supply of milk in the same room with other articles of food.

J. P. Rowe.

Absorptive Power of Milk.—Attention has been called in the daily papers to a practice prevalent in some parts of the country, which appear to illustrate the power possessed by milk of absorbing atmospheric impurities. It is that of placing a saucer of new milk in a larder, to preserve meat or game from taint. It is said that not only does it answer that purpose, but that the milk after a few hours becomes so bad that no animal will touch it.

[Housekeepers cannot be too cautious how they expose food of any kind to emenations of decaying substances. Dry bread will absorb decaying odors and soon become unfit to be taken into the human stomach, if shut up in the same room or cupboard with bad vegetables, meat or other things. Water will absorb infectious air if left in a sick room, or exposed to putridity. There is great apparent ignorance generally upon this subject, and many persons and families are made sick from eating and drinking substances that have been rendered poisonous by absorbing the germs of disease from bad air.—Ed.]

LESSONS TAUGHT BY SUFFERING

Ed. Agriculturist: The bed of sickness often teaches many valuable lessons. Suffering untold agony with an affection of the head, resulting in partial deafness, I learned a lesson never to be forgotten. The thoughts and suspicions, without any foundation, which leaped through my brain were unjust and unnecessary. I have since tried to look with charity and real pity on those with faults, since nothing so much as ill health or abnormal conditions can cause inconsistencies of conduct and petulence.

Be tender towards a fretful child. The cause may be traced to indigestion, unequal circulation or some discomfort of the body. Keep before you the fact that two-thirds of humanity are sufferers physically, and you may not wonder at the impossibility of perfection on earth. Of all the virtues we poor mortals need most to cultivate, *charity stands first.*

Arundal.

How to Rescue a Drowning Person. A child may be easily managed by an expert swimmer; but if the drowning person is strong and powerful, it is often imperatively necessary to keep out of his reach until he is partially exhausted; otherwise he will clutch his rescuer, and both may go down together helpless. Calmness and caution are invaluable in the water. The sufferer will clutch anything extended toward him at first—an oar, branch of a tree, a necktie, or a sleeve of a jacket, and if the other end of the article can be held in the mouth, the rescuer has the use of his arms. But still it is needful to keep out of the reach of the drowning person. Go behind him and push him along, but never attempt to reason with him. If he becomes insensible, a good swimmer can easily bring him to the shore or to a place of safety, and then the proper means of restoration should be immediately used. Impulsive recklessness, even though inspired by the most generous feeling, will not be so likely to save a drowning man as thoughtful caution. It may be well to mention that in case one feels cramp coming on while in the water, it is best not to stop, but to strike out faster than before; a sudden jerk of the limb is often an effectual relief.

To Save the Drowning.—The Massachusetts Humane Society has published very brief and intelligible directions for saving the lives of persons rescued from the water after they have become insensible. They are as follows:

1. Lose no time. Carry out these directions on the spot.

2. Remove the froth and mucus from the mouth and nostrils.

3. Hold the body, for a few seconds only, with the head hanging down, so that the water may run out of the lungs and windpipe.

4. Loosen all tight articles of clothing about the neck and chest.

5. See that the tongue is pulled forward if it falls back into the throat. By taking hold of it with a handkerchief it will not slip.

6. If the breathing has ceased, or nearly so, it must be stimulated by pressure of the chest with the hands, in imitation of the natural breathing; forcibly expelling the air from the lunge, and allowing it to re-enter and expand them by the elasticity of the ribs. Remember that this is the most important step of all.

To do it readily lay the person on his back, with a cushion, pillow or some firm substance under his shoulders; then press with the flat of the hands over the lower part of the breast bone and the upper part of the abdomen, keeping up a regular repetition and relaxation of pressure twenty or thirty times a minute. A pressure of thirty pounds may be applied with safety to a grown person.

7. Rub the limbs with the hands or with dry cloths constantly, to aid the circulation and keep the body warm.

8. As soon as the person can swallow, give a tablespoonful of spirits in hot water, or some warm coffee or tea.

9. Work deliberately. Do not give up too quickly. Success has often rewarded the efforts of hours.

Eating Fruit Skins.—The marjority of country people I have observed eating fruit, eat the skin of it also. Their children eat it in the same manner, and seem never to have been taught that the skin of fruit—be it apple, peach, pear, plum or grape—should never be eaten, especially if uncooked. Fruit skins are so difficult of digestion that there is probably not more than one stomach in a hundred capable of performing the difficult task. The skins are to fruit what shells are to nuts, hides to animals, and husks to grain. To oblige or allow a child to eat his apple or pear unpeeled, is unkind and wrong, for it is no question of dointiness, but of health.—*Cor. Rural New Yorker.*

Remedy for Warts.—Warts are very troublesome and disfiguring. The following is a perfect cure, even of the largest, without leaving any scar. It is a Frenchman's prescription, and has been tested by the writer: Take a small piece of raw beef, steep it all night in vinegar, cut as much from it as will cover the wart, and tie it on it; if the excrescence is on the forehead, fasten it on with strips of sticking-plaster. It may be removed in the day and put on every night. In one fortnight the wart will die and peel off. The same prescription will cure corns.

A Child's Bed.—A child's bed should slope a little from the head to the foot, so that the head may be a little higher than the feet—but never bend the neck to get the head on a pillow. This makes the child round-shouldered, cramps the veins and arteries, and interferes with the free circulation of the blood. Even when the child is several years old the pillow should be thin, and made of hair, not feathers.

Earache.—There is scarcely any ache to which children are subject, so bad to bear and difficult to cure, as the earache. But there is a remedy never known to fail. Take a bit of cotton batting, put upon it a pinch of black pepper, gather it up and tie it, dip in sweet oil, and insert into the ear. Put a flannel bandage over the head to keep it warm. It will give immediate relief.

Preservation of the Teeth.—Bowditch, in examining the teeth of forty persons of different kinds of life, found in almost all vegetable and animal parasites. The parasites were numerous in proportion to the neglect of cleanliness. The means ordinarily employed to clean the teeth had no effect on the parasites, whilse, soapy water appeared to destroy them. If this be a true version of the cause of caries—the action of acids, supplemented by the action of fungi—then it follows that the great means of preserving the teeth is to preserve the most scrupulous cleanliness of the mouth and teeth, and to give to the rinsing liquids a slightly alkaline character, which is done by the admixture of a little soap. This is not so pleasant a dentrifice as some, but is effective and scientific. Acids not only dissolve the salts of the teeth, but favor the increase of the fungi of the mouth. No increase of fungi and no action the dental tissue occur in solution of soap. The good effects of stopping the decay of the teeth, in the light of these experiments, are intelligible. The penetration of acids and fungi is prevented.

Care of the Hair.—Brushing the hair every day, the more the better, is recommended to those who crave a luxuriant and handsome growth. If it is very oily, wash it occasionally with a lotion made by mixing one drachm of soda with half a pint of water and adding the well-beaten yolks of two eggs. A teaspoonful of ammonia in a quart of rain water makes a good lotion for the hair; wash it in this frequently, dry it well, and brush it a long time; if the ammonia is too strong it will bleach the hair and injure it. The use of a lead comb will darken flaxen and red hair, and it is said on good authority, will water in which potatoes have been boiled. Hair oils and pomades are an abomination, and are, as they should be, entirely out of fashion.

To Avoid Sleeplessness.—If you wish to sleep well, eat sparingly of early suppers. Avoid all arguments or contested subjects near night as these are likely to have a bad effect on one who is troubled with sleeplessness at night. Avoid having too much company. Many persons become so excited with the meeting of friends that sleep departs for a time. There is probably nothing better after cultivating a tranquil mind, than exercise in the open air. By observing these simple rules, sleeplessness, in the majority of instances, may be wholly cured.

To Remove Freckles.—A simple remedy for removing freckles is a pint of sour milk and a small quanedity of horse-radish. Let the mixture stand over night, and use it as a wash three times a day until the freckles disappear.

The Earliest Bank of History.

PAPER VS. COIN.

In 1171, when the gallant republic of Venice singly withstood the shock of the Asiatic hordes that threatened to inundate Europe, Duke Vitale Michell II. called on the wealthy citizens to contribute to a load of 2,000,000 ducats for the defense of the state, the sums so loaned to be entered to the credit of the contributors on the books of the republic. These credits being divisible and transfurable, grew into favor as a currency, performing all the functions of money, and rose to a high premium above gold and silver coin. Such was the origin of the earliest bank of history. In 1423, a law fixed the *agio*, or premium, at 20 per cent., and directed all payments not otherwise provided for to be paid at the

bank of Venice, which at the same time it discontinued the 4 per cent. interest that had hitherto been promptly paid on the credits. This 20 per cent *agio*, added to the coin ducat of Venice, constituted a new unit of value, represented by no coin, yet maintaining its ideal existence as the ducat of the bank of Venice, and rose to an additional *agio*—termed a *sur-agio*—of 20@30 per cent., and continued the favorite currency of the Adriatic for nearly 400 years, until the remorseless march of Napoleonic despotism, in 1797, crushed the republic. A worthless booty was found in the bank for it had no coin or deposit, but only a faithful record of the loans that, more than 600 years before, the citizens of Venice had made to preserve the life of the republic. France repaid the citizens, but the bank and the republic were no more. There was the money of a republic having no foundation but credit on the books of a department of its treasury, with no coin in its vaults, and not bound to make that credit good in later times by any payment of interest or any redemption whatever, which yet stood for hundreds of years at a high premium over gold and silver coins. Plain and open in all its progress, there was no peculation or steal in any of its processes.—*N. Y. Commercial Journal.*

DOTTINGS AND JOTTINGS.

BY ISAAC KINLEY.

HONESTY, every one says, is the best policy. As it is the best also in morals, where does the rogue find his argument? Man is said to be a rational being; but by what logic can there be deduced, for crime, a plausible pretext? The criminal may indeed evade human laws; but the laws of God are within, and their penalties are inevitable—torturing even in this life, sometimes to confession, sometimes to suicide, and always to misery.

Ignorant and short-sighted policy is crime. Its consequences should frighten even villains to virtue.

"Were I not Alexander, I would be Diogenes," was said by that human butcher yclept in history Alexander the Great.

There was more wisdom in this saying than is often found in the acts of "Macedonia's madman." Alexander had conquered the world to his desires, and Diogenes had conquered his desires themselves. The hero commanded the resources of the world and had not enough; the cynic lived in his tub and was content. The rich wines and purple robes of Babylon no more satisfied the wants of the one than the water of the brook and his sackcloth those of the other. Extremes met, and the humbler man was the greater conqueror.

Could we look into the heart and see the *motives* that have inspired the act—could we see the temptations that have bewildered, and the struggles only just not strong enough to conquer, we would often excuse, and sometimes approve, where we now condemn, and sometimes condemn where we now approve and applaud.

The moral of an act lies in the *intent*. Blessings are for him who earnestly strives to do the right.

Blinded though he be by a thousand prejudices, the striving will ultimately rend the vail, and he will be enabled to see. It was because the persecutor honestly believed that he was doing the will of God, that the heavenly vision came, and Saul of Tarsus became Paul the apostle of the Gentiles.

A man stood straight up, looked me full in the face, and deliberately told that which he knew to be false. He knew he had said that which was not true. He knew that I knew he had told what was not true. There was a quiver in his eye which he could not quite conceal, a quailing before my strong contempt which he could not quite avoid. He put a hundred or so dollars in his pocket by the falsehood, and took a like amount out of mine. And yet he, and not I, was the loser—I, and not he, was the gainer by the transaction.

What did he lose, do you ask? Possibly money. For I could never again trust him, when only his honor was in pledge, to the amount of a single dime. I could not advise a friend to trust him, even though his necessities might be ever so great. I could never again speak of him as an honest or honorable man, or as one with whom it would be safe to be associated in any business transaction. So the lie which earned him a few paltry dollars at its utterance may cost him many hundreds before he has done with its consequences.

It cost him in reputation. One person, at least, knows him to be a man without honor or integrity. If, as a warning to friends, I may have told of the transaction to others, the news of his falsehood may have spread, and many besides myself may have learned of his dishonor. And if a jury of twelve men may, at any time, have hesitated to accept his statements on oath, or found his honor light as weighed in the scale against that of another, possibly it may have been that the lie he told to me came up to curse him.

There is no concealing a falsehood. Even if the person to whom it has been told intends, out of mercy, to withhold it from the world, he cannot quite carry out his charitable intentions, for he must himself be truthful; and, though he may never turn public accuser, he can never again speak of the author of the falsehood as being an honorable man, or one whom under any circumstances it will be safe to trust. And if he should happen to be in such relations to the man as to know him well, a failure to praise will be accepted as an accusation, and others will learn to hesitate.

But the liar, himself, is the greatest gossip of his own lie. Having told it, he feels that it must be supported; and the first necessitates the telling of ten others not less meretricious. Neither do these escape detection, and thus the witnesses of his bad honor are multiplied.

But, unfortunately, the new lies need bracing quite as much; and thus the first falsehood becomes the father of an endless progeny. Soon his very countenance loses the look of integrity and proclaims him unmistakably to all. His reputation is in the air, and, in language which cannot be misunderstood, every one hears him proclaimed a liar.

He loses in moral growth; and this, valuable as reputation or property may be, is the greatest of all losses. Integrity is a treasure in itself, and a man with God on his side may face the world. Its value is not measured by the money it puts into the pocket, the reputation it brings, or the offices of trust or profit with which it honors one. It is itself the gold compared with which these are but common dirt.

The liar has lost his integrity, lost his reputation, lost his self-respect, lost the approval of heaven, and dwarfed his own soul. Weighed against these, what are the few paltry dollars which his falsehood put into his pocket?

And have I gained nothing? Some of my gains are negative one. I did not lose my integrity; I did not cover my face all over with the blushes of shame, and lose the power to look an honest man in the face. I did not cultivate a feeling among my neighbors that I am a man of doubtful integrity, and one whose word under oath is unworthy of belief.

But my greatest gain, that compared with which all else is as the dust on the shoe-sole, is a positive quantity. I have gained these and other reflections tending to reinfore my own integrity and to contribute to my own moral growth, a single grain of which outweighs whole mountains of money.

Again I ask, was he or I the loser—he or I the gainer by the transaction?

He who thinks meanly of others without a cause is likely himself to be mean. His opinions are the suggestions of his own baseness. His nature is a colored glass throwing its own hues on everthing he looks upon. It is a positive pleasure to have faith in the honor of others, and it is better to be deceived a thousand times than never to trust.

Nevertheless, he is not wise who confides indiscriminately. If there were but one tiger in the forest, the prudent man would carry his rifle. If but one man in a thousand be a rogue, it is quite enough to put a lock to the door. Safety is always on the side of prudence, and I should not choose to trust my money or my reputation in the keeping of one of whom I know nothing.

San Jose Institute and Business College, August, 1876.

INFLUENCE.

BY P. F. P.

I have stood on the bank of a quiet lake and admired its calm and unruffled beauty as its waters seemed sleeping on the bosom of mother earth. Then tossing a tiny pebble into it, I watched the circular ripple it caused, until the silvery wavelets, spreading wider and yet wider, have broken on shore.

I have held in my hand a single grain of wheat, and thought, as I looked from the single grain to the full bin, though its size is so small and its weight barely more than nothing, yet it is needed to make up the ton and full bin, which is composed of similar individual weights and sizes.

What a lesson is here to you and me! We, too, have an influence. It may be small, like the weight of the kernel of wheat; yet it is sufficient to exert a power over our associations. Our influence may be so small that we are unconscious of its existence. Nevertheless it is a quality inherent in every one, and, great or small, it exercises a constant and irresistible power over those about us. Silently, perhaps, yet certainly, we are tending to mold those with whom we associate after our own likeness, and they cannot help themselves.

At the same time, we are being acted upon by a similar influence exerted by our surroundings. This exterior power we cannot escape. Gradually it is making indelible impressions upon us.

Now, our influence is being exerted either for good or evil. We are either tending to elevate our fellowmen, to better their state and condition; or we are helping to degrade and drag them down. We are either sowing the seeds of virtue, or disseminating the germs of vice. We are either "co-workers together with God," or we are doing the work of Apollyon! There is no middle ground. We can no more prevent the effect of our own influence upon others than we can escape the power they exert over us.
